So we are faced with the Faustian choice of cutting back on our regulation of direct dischargers to free-up resources for pretreatment or running a really dog-faced version of the federal program just to play along. Such a choice is even more inane given the proven track record of many local POTW's in Illinois regarding adequately controlling their industries. We have also learned a very hard lesson from the first round of delegation of the NPDES program. When asked to do seemingly impossible tasks with insufficient resources, government is being set-up to look like buffoons by second guessors who harp away from the sidelines.

We can, however, maintain good program momemtum and not lose ground in Illinois if we can rely on the majority of our POTWs to continue to operate alternative local programs without the burdensome and excessive reporting and oversight called for in the federal regulations. The Illinois EPA also stands ready to aggressively pursue the imposition of the federal program for those remaining POTWs that have not been progressive in regulating their industries.

Recommendation -- The national pretreatment control program should be improved to ensure adequate protection of POTW operation and the environment (effluent, water quality and sludge). Maximum progress should be achieved by providing for the following:

- Approval by the State and/or USEPA of existing, fully operational and enforceable alternative local pretreatment programs of sufficient caliber to satisfy the requirements of the CWA and provide adequate protection of treatment facilities, sludge and receiving waters.

- Implementation, by date certain, of federal pretreatment program and national categorical standards in those instances where alternative local programs have not already been provided and approved by the State and/or USEPA or are not appropriate for the circumstances.

- Require new indirect industrial dischargers to, at least, comply with federal pretreatment requirements for new sources whether the POTW operates an approved alternative local program or the federal pretreatment program.

- Continue efforts to reform, where applicable, the federal pretreatment program so as to improve effectiveness and efficiency.

- Enhance methods and procedures for assessment of toxicity relating to POTW discharges.

(Note -- This recommendation is similar to the position adopted by ASIWPCA at the Annual Conference in August, 1983.)

The Challenge of Nonpoint Sources

I support a renewed national emphasis on the need for nonpoint source pollution control. In Illinois, there is definitely a demonstrated need for a cost-effective mix of point and nonpoint source control measures in order to achieve water quality management goals. I welcome reasonable and fiscally responsible enhancements of the nonpoint source program since the timing is ripe for a meaningful demonstration of national commitment to this aspect of the clean water program. I feel confident we have gained very valuable understanding of our nonpoint problems via the original 208 planning process. Further, we have already moved forward at the State and local level to advance from planning to modest but steady implementation of some aspects of the nonpoint source control program especially in the agricultural area. The Illinois Department of Agriculture and the local Soil and Water Conservation Districts are taking the lead role for addressing soil erosion control and other related problems. The Illinois EPA and the Illinois DOA have jointly expressed their support for more emphasis on nonpoint source controls. Appendix D presents a summary of the water quality planning process in Illinois.

Recommendations

1. Use of State WQM Plans -- New legislation for control of nonpoint sources should constructively build upon the base provided by certified and approved WQM Plans developed by the States pursuant to Section 208. Proper recognition and use of these plans can

greatly expedite the process of implementing nonpoint source control in those States that successfully complied with the original planning provisions of the Clean Water Act.

2. Mandatory requirements for implementation programs -- There is a strong argument for approaching the implementation of nonpoint source control programs in a phased fashion. Based upon our experience with previous planning efforts, there is a wide diversity of State and local approaches to nonpoint source management in terms of types of problems addressed, nature of control strategies (voluntary versus regulatory), and degree of funding support. In view of this range and variability, a new national initiative should be focused upon incentives, such as funding assistance for on-the-ground projects or even funding for established regulatory programs, as a logical first phase. These incentives could serve as a practical tool for generating the vital initial momentum for enhanced State and local attention on nonpoint source management and still provide valuable time for sorting out more long range program directions and strategies. Following this phase, USEPA, in concert with the States would be better positioned to fine-tune the overall nonpoint program including taking steps towards more extensive mandatory requirements where shown to be necessary. Such a phased approach would also coordinate more effectively with the final evaluation of the several pilot national progams under Section 208 such as the National Urban Runoff Program.

20-955 O—84——59

3. Funding assistance for implementation -- Such assistance can have a positive impact at this time. I would stress that practices and projects, technical assistance and education activities should all be considered as viable candidates for federal cost-sharing funds. We have been consistently pleased with the very positive results which can be achieved by providing for hands-on assistance in the agricultural arena. With respect to practices and projects, there are existing gaps in total coverage relating to other national programs (SCS, ASCS, etc.) for which new cost-sharing funds would result in direct benefits for water quality in Illinois. I mention "steep" slope, marginal farm lands as one example. Some consideration should also be given to gradual phase-in of the authorizations/appropriations for assistance to account for program start-up time, etc. Along these lines, I feel that hard lessons learned from the federal wastewater construction grants program are relevant to the nonpoint program as well.

4. USEPA oversight and review -- In my experience, USEPA was often placed in very difficult policy and technical positions under the original provisions of Section 208 of the Act. Whereas the point source program usually involved rather well defined and traditional intergovernmental relationships and control mechanisms, the nonpoint source planning effort often addressed a whole new array of such relationships and related technical issues. I believe the sudden imposition of any new mandatory program for nonpoint sources with broad review discretion for USEPA could lead to a very chaotic,

inconsistent pattern of decisions and program results. In other words, the "rules of the road" for nonpoint sources are so ill-defined at this point that sound reasoning cries out for some application of the general principles of "reasonable further progress" under workable timeframes. I greatly fear that to do otherwise will subject USEPA and probably the States as well to unwarranted, post-audit condemnation for failure to achieve what was undoable from the onset.

Progress on Construction Grants

I could attest today at length on the documented need in Illinois to continue support for the construction grants program. However, I mainly want to address on this occasion possible criticism which may be forthcoming regarding obligation rates for funds which have already been appropriated.

The 1981 Amendments to the Act resulted in numerous significant changes to the federal construction grants program. We, in Illinois, remain grateful to the Congress, and especially this Subcommittee, for their very constructive resolution of some very difficult issues. Those legislative actions, in turn, prompted major revision of the USEPA regulations for the grants program. These regulatory changes have yet to be finalzied. In fact, a number of very important policy issues, such as project phasing and segmentation and replacement and additions, are currently being handled by USEPA (and the States) on a case-by-case basis.

As line program managers, state administrators have seen several rounds of changes in the grants program. As much as we would like to prevent it from happening, delays in timely processing of projects are inevitable under such circumstances. Fortunately, for many of us the project backlog is such that once the program adjustments become operational we can quickly catch-up on obligations. In Illinois, we currently or soon will have ready about $200 million in backlogged projects beyond the level of authorized funds available over the next two years.

One important caveat that may further constrain the program involves any further undue delay in the redefinition of secondary treatment and finalization of the federal water quality standards regulations. Both of these issues need to be resolved in order to make any necessary refinements in treatment requirements for some POTWs.

I would, therefore, respectfully counsel the Subcommittee to take a long hard look at any negative comments about the management of the grants program now that the majority of States have accepted delegation under 205(g). I am proud of our record of achievement over the past five years since we became the first State in the nation to receive delegation of the federal program. With the assistance of Region V, USEPA and progressive grantees, we have managed to keep the program moving irrespective of the many complications such as advanced treatment reviews, innovative and alternative funding set-aside and fluctuating funding levels.

Recommendation -- Congress should continue to support the authorization and appropriation of federal construction grants assistance.

The Water Quality Standards Debate

Clearly, the USEPA got off the main track with their proposed reforms of the water quality standards regulations last Fall. In Illinois, we found the new "cost/benefit" provisions particularly troublesome. However, in our submission of written comments on the proposal we were not overly critical of the USEPA's efforts since, on balance, we sensed a new spirit of cooperation and, thus, felt we could work with most of their new concepts.

I would note that we did not share the same degree of concern that many others expressed that the proposal was a move to "gut" the fishable/swimmable goals of the Act by allowing massive downgrading of State use designations. For several years, we have been working intensively on developing more site-specific use designations and water quality criteria. Through these extensive analytical efforts, we have concluded that application of "attainability analyses" will not result in significant down-gradings of use designations. However, we can sympathize with the concerns of some interest groups which fear the misuse of increased flexibility at the State and local level. Of course, their seeming interest in maintaining past use designations, practically at any cost, presumes that the often hurried efforts under standards promulgation actions in the early to mid 70s remains valid today. I suggest to you that this is a very big presumption in some instances particularly now that the complexity of environmental problems is better understood.

It is my understanding that USEPA is now committed to revising the proposed standards reforms in a fashion that is more compatible with previous views of the standards setting process. In fact, I have reviewed their new proposal and feel generally comfortable that the problem areas have been constructively addressed. Thus, in view of this responsiveness by USEPA it would appear that new legislative initiatives on use designations, anti-degradation policy, etc. are not warranted at this time; especially if such action would serve to make the standards process too rigid. In other words, concern for "good government" would not be well served by reacting in kind legislatively to the regulatory miscues of last year.

Recommendation -- Congress should maintain the current provisions of Section 303 of the Clean Water Act relating to water quality standards.

General Program Operations

Given the addition of new sources of federal funding for program operations, such as 205(j) in FY83, the water pollution control program in Illinois has been maintained at a stable level. Assuming that federal funding, especially Section 106 support, is maintained at current levels, we project that our program will not lose ground through FY85. Of course, that leaves matters of program expansion for initiatives such as pretreatment left hanging for the near term.

In general, I remain optimistic about eventually realizing the potential for effective operation of the federal/state partnership envisioned under the Clean Water Act. The 205(g) delegation of the federal construction grants program has served as an excellent example of significant progress in that regard. I cannot report the same degree of

improvement in the NPDES program. The federal regulations for NPDES still hamstring the USEPA Regions and the States in terms of reducing the amount of excessive oversight and reporting required. Greater emphasis on "good government" would call for more recognition of the advances in program management and capability that have been achieved over the past ten years. Along these same lines, I feel that several reforms of the Act as well (ten year permits and partial delegation of NPDES) would improve the overall efficiency of the program.

One bright note about the NPDES program has been the slow but steady development of the general permits option for small, non-problem types of dischargers. Based upon my discussions with other state administrators, many states have been able to take advantage of this practical approach to managing the NPDES permit workload. In Illinois, we have run into some legal complications which have taken awhile to sort out, but we believe that we can make good use of this tool in the near future.

Recommendation -- Congress and USEPA should implement positive reforms which will further streamline program operations for NPDES.

Conclusion

The new national clean water program was started in 1972 in a general mood of distrust by most of the key players. States were viewed largely as not having delivered the bacon, so to speak, and were relegated to a secondary role. The industrial/business community was cautious about unfair competitive advantages and excessively demanding program goals and requirements. Environmental groups were not very comfortable with

government performance in general and thus supportive of rigorous deadlines and detailed legislative specifications for all aspects of the program. Of course, the ensuing program has seen a dynamic and often artful compromise among these interests which has resulted in demonstrable progress. However, I respectfully suggest that we have come to a point where this octopus like tug-of-war needs to be reconsidered in light of a concern for "good government."

I think there is a place now for a reasonable measure of trust among the principal movers of the national clean water program. Economic conditions are mandating that we somehow do more with less, but to date responsible reforms have not kept pace with the demands. I feel the duty, at this time, to sound a warning that a significant shortfall in meeting the colage of expectations placed upon the program is just around the corner unless positive action is taken.

In Illinois, we will certainly commit to doing our fair share towards achievement of the public's desires for clean water. However, we are going to need some help from the national policy-making level if another round of self-fulfilling prophicies about the inadequacies of public administration is to be prevented.

DEC 16 1982

Environmental Protection Agency
Division of Water Pollution Control
State of Illinois

Mr. Eugene F. Seebald
Manager, Division of Water
Pollution Control
Illinois Environmental
Protection Agency
2200 Churchill Road
Springfield, Illinois 62706

Dear Gene:

We have examined the revised "Illinois EPA - Procedures for Industrial NPDES Permit Issuance" sent to me by you on December 3, 1982, for our review. The short turnaround time in the revision of the document by you and your staff is greatly appreciated. The document, as revised, is acceptable and should result in permits that adequately address the control of toxicants.

Now that our concerns have been satisfied and we are in agreement as to procedures and strategy, I look forward to a continued cooperative effort by our staffs in the issuance of NPDES permits in the State of Illinois. I, as you, am most anxious that the program move forward and assure you of my personal commitment to that effort.

Very truly yours,

Ken

Kenneth A. Fenner, Chief
Water Quality Branch

Mr. Ken Fenner, Chief (5 WQP-26)
Water Quality Branch
USEPA
230 South Dearborn Street
Chicago, Illinois 60604

Dear Mr. Fenner:

In response to our recent meeting and your letter of November 15, 1982, we have revised our proposal for the "Illinois EPA - Procedures for Industrial NPDES Permit Issuance". We have made numerous changes to accommodate our agreement, and we feel the document fulfills our mutual intentions.

I and my staff appreciate your cooperation in drafting this proposal, and await your comments and approval so that permit issuance may proceed.

Sincerely,

Eugene F. Seebald, P.E., Manager
Division of Water Pollution Control

Illinois EPA - Procedures for Industrial NPDES Permit Issuance

The purpose of this document is to describe the administrative and technical procedures IEPA will use in the next round of industrial NPDES permit issuance. Emphasis of this strategy will be on the control of toxic substances.

Background

Illinois has, for the past decade, controlled the discharge of toxic substances, (principally heavy metals) through State law and regulation. However, there have been, and are, on-going changes to Illinois law, which directly affect NPDES permits. In addition to Illinois law and regulations, the IEPA will, of course, be utilizing Federal regulations for permit writing. Since State and Federal laws do not cover all situations, IEPA will exercise its best professional judgement in applicable cases. In order to provide better insight and clarification, a brief discussion of the elements affecting NPDES permit writing is presented.

A. Title 35, Subtitle C, Chapter 1, Parts 301 through 312 (hereafter Chapter 3). The basis in State law for most water pollution control regulations is contained in Chapter 3. It contains not only effluent limitations for deoxygenating waste, ammonia, and several toxic substances (i.e., heavy metals, cyanide, and phenols), but contains water quality limitations as well. Chapter 3 was promulgated in 1972, and has been revised several times since, most notably being in December of 1981, when the effluent limitations for several heavy metals, and phenols, were

revised. These limitations are technology based and uniformly apply to all dischargers as opposed to Federally promulgated limitations which apply to only specific industries. The Chapter 3 limits then cannot be compared directly to Federal guidelines. However, a comparison of Chapter 3 with many proposed and final Federal limitations shows that the technology requirements are essentially the same. In some instances the Chapter 3 numerical limit may be more stringent and in others less stringent.

Permits written by IEPA prior to December, 1981 contained the original numerical limits of Chapter 3. However, because of the December, 1981 changes, permits written in the future will contain the revised limits. Any existing limits will only be revised, however, in accordance with the Chapter 3.

In addition to effluent limitations, Chapter 3 establishes water quality criteria for general use, restricted use, and public water supply uses in Illinois waters. These criteria provide limits for many toxic heavy metals, cyanide, phenols, and substances which exhibit acute toxicity. These criteria are in the process of being evaluated and may be revised on a basin-by-basin segment to more accurately reflect actual uses, existing water quality, attainability, in stream biological activity etc. (see paragraph C).

B. <u>The Clean Water Act and Federally Promulgated Effluent Guidelines.</u> The NPDES permit program is based on, and assumes, the development by USEPA of national guidelines representing best practicable control technology (BPT), and best available technology economically achievable

(BAT). Development of BAT Guidelines for thirty-four industrial categories are to be the principal tool in controlling toxic substances through NPDES permits. These guidelines were to have been promulgated by 1980, but because of the considerable resource requirements, only eight of the thirty-four have been promulgated to date. Thus, without these guidelines, most of the industrial permits, while still continuing in effect, have been allowed to expire.

The Clean Water Act does provide another mechanism for establishing site-specific, technology based BAT limitations -- the use of best professional judgement (BPJ). The major drawback to this effort though, is the enormous resource requirement to draft BPJ permits on a case-by-case basis. IEPA has, in many cases, the technical expertise to utilize BPJ, however, it is felt that to be resource efficient BPJ would only be used in selected instances where truly needed.

In a few situations, effluent limitations more stringent than those required by existing BAT guidelines may be required to insure compliance with Illinois Water Quality Standards which generally prohibit creation of toxic or otherwise hazardous conditions in waters of the State. Such effluent limitations are not dependent on the availability of promulgated BAT guidelines and can be developed on a priority basis using toxicity data (or site-specific studies) and treatability information.

A lot of the problems of the past few years are being gradually eliminated by the anticipated promulgation of BAT guidelines in the next year or so. With the promulgation of BAT guidelines, IEPA will be able to effectively plan and schedule permit issuance, and efficiently utilize BPJ, where necessary, in conjunction with BAT in drafting permits.

C. Water Quality Standards -- Revisions

The standards review and revision process now underway in Illinois is intended to adapt the numerical and narrative parameter limits in the existing general standards to segment-specific applications. By assessing the existing and potential uses of individual stream segments and stream habitat, and revising water quality standards where necessary to reflect demonstrated levels of protection, we feel we are better able to tailor the standard to the needs of the segments.

The key to this review effort is the utilization of historical data (both chemical and biological) in conjunction with short term intensive surveys of major river basins. Detailed understanding of the conditions of the aquatic community in a given segment over time coupled with comprehensive water quality, fish flesh, and sediment data will identify potential water quality use limitations. Data on water quality in "control" areas and literature information indicates needed pollutant reductions, and information on discharge levels from contributing sources of pollution (point and non-point) support decisions on appropriate control programs.

D. Definition and significance of "toxic pollutants". As defined in the CWA, Section 502(13) . . . "The term "toxic pollutant" means those pollutants, or combinations of pollutants, including disease-causing agents, which after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will, on the basis of information available to the Administrator, cause death, disease, behavioral abnormalities, cancer, genetic mutations, physiological

malfunctions (including malfunctions in reproduction) or physical deformations, in such organisms or their offspring."

As part of the 1977 consent decree with NRDC the USEPA used this definition to develop a list of sixty-five specific compounds and classes of compounds (subsequently expanded to 126 specific substances) -- priority pollutants -- which would receive the focus of national attention.

However, one of the major drawbacks of prior and current efforts has been the focusing on a limited (126) number of toxic compounds, since this ignores many other possibly toxic compounds contributed to the environment, and the cumulative effects of those compounds. If a toxics strategy is going to succeeed it will have to recognize the existence of problems caused by other than a "priority pollutant list" and the cumulative effects of two or more of these compounds.

A limited number of facilities with a high potential for toxicant discharge are being examined for the presence of pollutants of concern using open-ended procedures. IEPA or the dischargers themselves perform broad-scan chemical analyses by GC-MS or specific analyses for selected chemicals identified through evaluation of raw materials, products, and processes. Pollutants determined to be present at significant levels then are investigated for toxicity or other harmful environmental effects.

Illinois Water Quality Standards, Section 302.210, state: "Any substance toxic to aquatic life shall not exceed one-tenth of the 96-hour median tolerance limit (96-hour TLM) for native fish or essential fish food organisms, except for USEPA registered pesticides . . .". Section 302.410, applicable to Secondary Contact and Indigenous Aquatic Life

Streams state: "Any substance toxic to aquatic life not listed in Section 302.407 shall not exceed one-half of the 96-hour median tolerance limit (96-hour TLM) for native fish or essential fish food organisms."

These Standards provide a firm basis for requiring acute toxicity tests of dischargers where acute toxicity is suspected or has been documented in the receiving waters.

A number of previous studies have demonstrated that most types of industrial wastes being treated to at least "BPT" levels do not generally demonstrate "acute" toxic effects. Therefore, short-term static testing for acute toxicity is not viewed as a routine day-to-day tool for toxics evaluation. The IEPA will require these procedures where site specific conditions dictate their use. IEPA is also proposing, as a screening procedure, for those cases where it is applicable, the use of a modification of the Ames assay to identify potential chronic and mutagenic effects. If any assay results are positive, then the IEPA will either go to further Ames testing or other appropriate forms of testing (such as fish flesh analyses, stream surveys, longer term toxicity testing, etc.), or both. In recognizing that there are numerous studies that have been conducted and are ongoing, the IEPA continues its efforts to evaluate the literature, and to consider procedures it deems appropriate for application in Illinois. This effort will offer the IEPA and the USEPA better opportunity to coordinate the monitoring activities of both Agencies.

E. Relationship of the current "major discharger" concept with priorities under this toxics implementation strategy.

Because of the unique manner in which this strategy is proceeding, the concept of a "major" discharger does not appear to be applicable. Since both agencies (USEPA and IEPA) are dealing with many of unknowns and much information gathering, it is difficult to assign the commitment inherent in the previously defined "major" discharger designation. Rather, for permit writing purposes, the IEPA Permits Section will commit to the procedures outlined in this document regardless of whether or not those high priority dischargers outlined are designated "major". After the permits have been written, if any dischargers became apparent candidates for further compliance commitments, then the annual "majors" list negotiations can handle these dischargers. It is not anticipated that the number of "major" industrial facilities will increase as a result of this strategy.

Program Integration for Toxics Control

The drafting of NPDES permits for significant industrial dischargers will not be the sole effort of permit writers but rather will represent a coordination of the efforts of many programs within the Agency. Within the Division of Water Pollution Control (DWPC), it is expected that the activities of the Planning Section's ambient monitoring program and the Field Operations Section will play a significant role in support for permit writing. At the Agency level there is presently an ongoing coordinated review of permit applications (CROPA) among the permits sections of all divisions, and finally, it is expected that general

20-955 O—84——60

toxics policy will be ultimately provided by the Agency's multi-media toxics strategy team.

As part of the industrial strategy, any findings of the ambient monitoring program,[1] that indicate a problem related to toxic wastes, will be integrated into other permit writing efforts and field operations activities. As has occurred in the past, any serious or significant problem areas will be addressed with possibly additional monitoring or special studies. For dischargers where water quality impacts could be suspected, permits would be drafted (or modified) to include effluent toxicity evaluations using a variety of necessary, appropriate biological and chemical tests, and upstream and downstream water quality monitoring. These permits would have appropriate reopener clauses to allow IEPA to modify the permit, as necessary, to reflect the results of the evaluations. The relationship of the ambient monitoring program with other activities, (i.e. permit writing) will be a two-way effort in that suspect situations identified elsewhere could trigger special ambient monitoring (as resources allow).

Specifically, some of the various field activities such as benthic analyses or complete scan fish flesh analyses will be factored into permit writing activities. Other commitments notwithstanding, special water quality intensive surveys, apart from those associated with the

(1)As discussed in the FY82 program plan . . . Ambient Monitoring -- Water quality monitoring involves activities conducted by the state directly or by agreements with other agencies to obtain data on the quality of waters of the state. Water quality monitoring activities conducted directly by the IEPA include fixed station monitoring and intensive surveys, lake surveys, and special investigations.

basic surveys, may be selected from the same priority list that drives permit writing activities. As results become available, they would become part of our actual literature resources, and part of the permit record. Conversely, ongoing commitments by the Ambient Monitoring Unit, such as the intensive survey of the Sangamon River may drive permit writing activities by virtue of the fact that this data willl be available sooner.

Several situations occur in the "real world" field that never show up on any applications, or on any inspection forms. Situations such as sloppy internal maintenance practices, storage of raw materials or solid wastes, process operations which periodically affect treatment works operation, etc., occur all too frequently. The field staff of the IEPA are equipped to deal with these situations, but present resources are committed to the point where these types of inspections are now limited.

The IEPA is proposing, as part of this strategy, that the field staff make inspections that will lead to more efficient treatment plant operation, and to the reduced likelihood of toxics entering the waste streams through plant process inspections, transfer and storage area inspections, BMP plan reviews, etc.

Permit Issuance Procedures

A. Categorization of Dischargers

In order to develop a manageable program it will be necessary to categorize permits by their relative potential to discharge toxics. Three categories are proposed:

1. Category I -- Industrial dischargers with a high potential for discharging toxic organics and possibly heavy metals and other inorganic

toxics. Justification for placing dischargers in this category will be based on general information, their application, development documents, IEPA and USEPA studies, and other relevant literature sources (i.e., treatability manuals, JWPCF, etc.). (See Appendix A). However, it is expected that the list will be refined in the future as individual applications get reviewed.

2. Category II -- Industrial dischargers with a potential for discharging only heavy metals and other toxics. This category will be based on general historical information and application data. These permits will be drafted based on existing State or Federal law and regulation.

3. Category III -- Industrial dischargers with little, if any, potential for discharging toxics. This category will generally include "secondary" industries, cooling water dischargers (non-contact), dischargers with only domestic wastes, etc. These permits will be drafted based on existing State or Federal law and regulation.

B. IEPA Procedures for Drafting and Issuing Industrial NPDES Permits Category I.

The following procedures will be employed in the development of permits for facilities known to have, or suspected of having, toxic or other significant pollutants in their discharges.

1. IEPA, in cooperation with USEPA, will develop a list of industrial facilities with known or suspected toxic pollutant discharges. This list will be known as the List of Significant Dischargers and will be updated annually as part of the 106 State Program Plan.

2. Upon completion of the list IEPA will prioritize the facilities on the list for permit issuance (i.e., assign projected public notice and issuance dates for a period of one year from the date the list is completed; assign a lead person for the processing of each scheduled permit; and update the projections at intervals of 3 months). A projection of the permits to be worked on for the next 3 months will be developed within 2 months of the date of this agreement. That projected list will be updated by the tenth of the following months: September, December, March, June. The projection will include target dates for development of a draft permit, date of public notice and date of final issuance. Because of the complexity in drafting these permits, slippage will occur in some instances. It is clearly understood that the projected dates are desirable targets and that strong efforts will be made to achieve these but they are not binding commitments.

3. The facilities to be included in the List of Significant Dischargers will be determined by available information, industrial categories that have a potential for discharging toxicants, information contained in completed Form 2C applications and any other indication that toxicants may be present.

4. For purposes of this strategy toxics are grouped into: (1) the contaminants for which effluent and water quality limits have been established in Chapter 3, and (2) toxic contaminants for which limits have not been established in Chapter 3.

5. In reissuing permits containing toxics in Group 1 --

contaminants for which effluent limits have been established in Chapter 3 -- the limits for those contaminants shall be established as follows:

(a) For existing dischargers the limits, as established by Chapter 3, will be utilized, unless more stringent effluent concentration limits have been promulgated by USEPA.

(b) For new discharges, the revised Chapter 3 limits or promulgated New Source Performance Standards will be applied.

6. The reissuance of permits on the List Significant Dischargers will occur as follows:

(a) Facilities on the list of significant dischargers with no potential for pollutants other than those covered under Chapter 3.

1. Issue 3-5 year (maximum) permits with limits based on Chapter 3 (as stated for Group 1 toxics) or Water Quality Standards, whichever are more stringent. Included will be a reopener clause, in case guidelines are promulgated and are more stringent. Five year permits would be issued where effluent guidelines have been promulgated.

2. The effluent limits in short term permits, upon expiration, will be evaluated against any changes in State or Federal laws and regulations, BAT guidelines, State effluent limitations, and water quality requirements. Promulgated BAT effluent limits will not cover all parameters of concern and, therefore, permits will be developed utilizing a hierarchy of available information. BPJ permit limits will be developed, as necessary.

(b) Facilities on the list of significant dischargers with known, or potential for, other toxics as well as Chapter 3 pollutants.

1. When sufficient information is available on potential toxic pollutants: develop BAT/BPJ controls, including limits wherever possible, for contaminants in Group 2, and Chapter 3 limits for contaminants in Group 1. Compare with Water Quality based determinations, and issue 5 year permits, with reopener clauses for Chapter 3 limitations. If promulgated guidelines exist, they will be used in place of BAT/BPJ for parameters covered.

2. When additional information is needed:

i) Issue permits with reopener clauses. For any polluants for which information is available, include limits developed as in b(1) above. For others, include information gathering requirements with results generally due in 3 to 12 months (with possible exceptions for long-term bioaccumulation studies or process evaluations at complex facilities).

ii) Where results of information-gathering warrant, use the new data to develop controls, including limits wherever possible, on additional parameters as in b(1), and modify permits to include them, deleting reopener clauses.

iii) Where conditions warrant, an information request pursuant to Section 308 of the Clean Water Act will be made. In some cases USEPA Region V, will initiate the 308 request.

7. Verification Monitoring

For those permits where verification monitoring (in the permit) is indicated, the Agency proposes to require anywhere from three to twelve or more samples be chemically analyzed for suspect toxics. The monitoring point could be at either the effluent discharge or, if appropriate at some "internal" location. The amount of monitoring will be determined on a case-by-case basis depending on relative likelihood of occurrence, expected levels of discharge, potential impact on water quality, etc. If levels are at or below "detectible levels," then monitoring may be discontinued with formal permission from IEPA. However, it must be recognized that for some highly toxic, bioaccumulative substances, such as PCB's and dioxins, the suspect contaminant must continue to be addressed. If levels can be quantified, but at levels much below "toxic" levels, then continued monitoring but at reduced frequencies will be in order. For discharges where levels are at, or above, the toxic range, then continued chemical monitoring, and possibly Agency or permittee biological monitoring will be in order. At this point the Agency will require the permittee to develop a program to identify and eliminate the source of toxic polluants. If this is a short term program, no permit modification may be necessary; however, if a long term program becomes necessary then a permit modification would be necessary.

The monitoring requirements will be placed in the permits as an ongoing requirement, but with a condition such that after a certain period of time (e.g., 3 months, 6 months, 12 months, etc.) the permittee would have to trigger a request for Agency review of the

data. Thus, monitoring would have to continue unless an Agency review authorized modification or elimination of the monitoring requirement.

For those permittees found to not have discharges of toxic polluants at levels of concern (either acute or chronic) the permits would be extended to 5 years.

However, for facilities found to have discharges of chemicals with the potential for bioaccumulation or acute or chronic toxicity the State, and/or where appropriate the discharger, will proceed with field biological screening and/or confirmation monitoring. Where necessary the discharger will be required to develop a program to eliminate any problem.

8. Biological Monitoring

While most of the biomonitoring in the near future will be done by the Agency, eventually we will want industry to assume this burden. When industry is required to conduct biomonitoring, it will be necessary for the Agency to identify and specify procedures and protocol for both the collection and analyses of biological data. IEPA and USEPA will jointly agree on the procedures and protocol to be followed, for each permit on a case by case basis.

In some instances it may be more advantageous to require biomonitoring outside of the context of the permit. Possible reasons for this include: 1) the timing of renewals; and 2) new information suggesting an immediate need for biomonitoring.

9. IEPA Field Support Activities in Support of Permit Writting -- Biological Screening and Confirmation Monitoring

As mentioned previously, several conditions occurring during the permit review could trigger IEPA field toxics evaluation. These evaluations could take on many different forms depending on the discharger's wastewater characteristics, water quality impacts, etc. The water quality studies conducted as part of the ambient monitoring program could serve as either a screening or a confirmation mechanism.

In addition, the IEPA proposes where necessary, to do Ames Assays and/or acute toxicity testing procedures for mutagenicity screening and toxicological evaluations of specific effluent discharges of facilities designated to be high potential toxicant dischargers. These would initially be screening mechanisms, however, if results proved positive, they could be repeated and expanded to confirm and quantify original results.

C. Procedures for issuing permits in Category II -- Industries with a potential for discharging only heavy metals and other inorganic toxics.

Industries are placed in this category based on information presently available. However, if during the application review process, any toxic organics are identified as being present then permit processing will proceed as though they were Category I dischargers. For those dischargers confirmed to have only heavy metals and conventional pollutants, permits will be drafted based on either promulgated federal guidelines (i.e., BAT or BCT), or State law, Chapter 3. Heavy metals limitations will be derived based on the same rational used for Category I dischargers. Limitations for conventional polluants will be based either on promulgated BCT or Chapter 3.

It is expected that in the near future, a priority list will be developed, however, because of resource constraints, it will not be possible to establish a firm schedule for issuance. The priorities will be established on the following basis:

1. New facilities or existing facilities with major construction projects resulting in increased or otherwise different flows,

2. As a result of Pollution Control Board enforcement or variance orders, and

3. Requests from the Field Operations Section.

Procedures for issuing permits in Category III -- Industrial Dischargers with little if any potential for discharging toxics.

As with Category II dischargers if toxics are found to be present permits will be processed in accordance with the procedures outlined for Category I. Otherwise, the basis for effluent limitations will be either Chapter 3, or promulgated BCT guidelines. Permits will be prioritized, (but not scheduled), in the same manner as Category II dischargers.

Permits in this category will be issued as resources allow. Reasonable efforts will be made to include the permits in this category as "fill ins" in the process of issuing Category I and II permits. As such, permits in Category III will be assigned to permit writers to be processed when time is available.

APPENDIX B

The Federal Pretreatment Program

The goal of the U.S. Environmental Protection Agency's Federal Pretreatment Program is to protect municipal treatment plants (commonly called POTW's for publically owned treatment works) and the environment from the damage that may occur when hazardous or toxic wastes are discharged into a sewage system. This protection is achieved mainly by regulating non-domestic or indirect industrial dischargers. There are three major objectives in the pretreatment program:

1) Prevention of interference with POTW operation,

2) Prevention of pass-thru of pollutants, and

3) Prevention of municipal sludge contamination.

The program applies to any POTW with a total design flow greater than five million gallons per day and receiving industrial discharge, and certain POTWs under 5 MGD receiving industrial wastes. Under the 40 CFR 403 General Pretreatment Regulations published January 28, 1981, there are certain legal authorities, administrative tasks and procedural requirements to be achieved and developed by the POTW in the development of a local program, as follows:

Legal Authority: The POTW should have the authority to:

1) Deny or condition new or increased contributions of pollutants from the industrial users.

2) Require compliance with applicable Pretreatment Standards and Requirements (including categorical standards, State, and local limits).

3) Have control mechanisms (permit, contract, or order) to insure compliance.

4) Require compliance schedules from industry to install pretreatment equipment to meet standards.

5) Require industry to file reports (baseline, compliance, self-monitoring and final).

6) Have procedures for inspections, surveillance and monitoring.

7) Have legal remedies for violations.

8) Halt or prevent discharge which endangers environment or threatens to interfere with POTW operations.

9) Have confidentiality procedures.

10) Carry out administrative and procedural requirements of the pretreatment regulations, in addition to the publication of names of significant violators in the larget daily newspaper.

Administrative Tasks: The POTW should submit the following documents:

1) Industrial User (IU) survey.

2) Technical analysis which includes:

   a) Description of prior instances of interference with POTW operations that are known or suspected to have been caused by industrial contributions.
   b) Method of sludge disposal.
   c) Description of the nature and extent of POTW sampling program.
   d) Description of sampling program within treatment plant itself of the influent, effluent liquid, and sludge.
   e) Description of the development of local limits.
   f) Procedures for public noticing the development of local limits.
   g) Provisions for public comment.

3) Compliance monitoring

   a) Description of the procedures to be used in receiving, evaluating and filing baseline, compliance, self-monitoring (semi-annual), and final reports submitted by the IU.
   b) Description of the monitoring program including scheduled, random, and demand monitoring.
   c) Description of the procedures used for follow-up of instances of non-compliance of above items.
   d) Description of chain-of-custody procedures.
   e) Description of equipment and personnel on hand.

4) Notification of IUs

   a) Procedures to keep POTW informed of new and existing regulations.
   b) Procedures to notify IUs of existing and new regulations and requirements.

5) Aministrative Procedures

   a) Procedures for IU non-compliance

      1) To notify IU of incident
      2) To provide IU opportunity to respond
      3) To allow time for POTW or IU to correct violations
      4) To allow time for POTW or IU to verify that violation has been corrected
      5) To take legal action thru show-cause hearing, injunctive relief, civil or criminal penalties, and damages.

b) Procedures to gather admissible information for court proceedings or enforcement actions.

6) Public Participation

a) Legal authority to publish names of significant violators in the area's largest newspaper.
b) Procedures to publish names.
c) Procedures to make data relevant to violations available to the public.
d) Procedures for giving public notice of the development of specific local limits.
e) Provisions for public comment.

7) Organization, Staffing and Funding

a) Description of POTW organization.
b) Description of other organizations involved.
c) Duties of staff and level-of-effort.
d) Most recent annual financial statement and projected first-year budget.
e) Itemization of pretreatment program costs.
f) Source of revenue.
g) List of major equipment to be used plus commercial services or alternative capabilities.

The POTW shall develop all the above items and submit a request for program approval as specified in the municipal NPDES permit. The program's main emphasis is treatment for treatment sake and all categorical indirect dischargers will be regulated irrespective of the treatment plant efficiency and removal.

State Pretreatment Program

In Illinois there are over 754 POTW's, and an estimated 15,000 to 20,000 industries with approximately 3,000 industries thought to be subject to the pretreatment regulations. At this time there are 84 POTW's required to develop at least a portion of the program. The 3,000 industries are located mainly in the 84 POTW's. Under the national program requirements, the State would still be responsible for wet categorical industries if they are located in the remaining 670 POTW's.

The Illinois EPA has recognized for some time, however, that while there are a number of problems with indirect discharging industries, the problems don't exist in every city with any industry. To their credit, a number of Illinois municipalities, both large and small, have had programs of some degree of effectiveness for some years.

Acknowledging the fact that there were local programs already, the Illinois EPA embarked on a State program which would reduce the scope and magnitude of the national program and make the most efficient use of its

limited resources. The State program has been directed towards the municipal side and identifying pretreatment problems, and then, only requiring that local programs be developed to deal with these problems.

The State program is divided into a two phased approach. Phase I consists of an industrial user survey, technical analysis and ordinance evaluation while Phase II includes the monitoring, financial, equipment and personnel needs, and finally the development of local limits if necessary. Much of the State program requires the items listed in national program above. The main difference is that the Phased approach would allow the POTW to initially submit the minimum information to create a data base. After State review and evaluation, a decision would be made on the need to continue with the program. This decision would be made on the results of the submission, a complete survey, plant O and M, pollutant levels in plant influent, effluent and sludge, and finally, the readiness to pick up the program if conditions changed.

Attention has been focused on satisfying the objectives of the pretreatment program - prevention of pass-through, prevention of plant upsets or interference, and interference with sludge disposal options. It was found that evaluating industrial impacts on pass-through and plant upsets was relatively straightforward because of a wealth of data from water quality and effluent monitoring, and plant operational history. However, there was not a comprehensive data base from which to evaluate the concentrations of heavy metals in sludge.

To correct this deficiency, the Illinois EPA initiated an influent, effluent, sludge sampling program of major POTW's across the State. This data was evaluated and "background" levels of heavy metals were calculated. The following conclusions were reached:

1) These background levels were not single, specific values due to the varying levels found in public water supplies (i.e. ground or surface waters), varying types of plumbing materials, presence of combined sewers, infiltration of groundwater into sewers, different types of treatment systems, varying treatment efficiencies, etc.

2) The calculated levels were comparable to "typical domestic only" values recently reported by the Journal of the Water Pollution Control Federation.

3) While perhaps over a hundred of the 160 POTW's analyzed had sludge with some metal contents above background, only thirty to forty may be in a position where sludge disposal options are seriously limited. These POTW's are using alternative methods for disposal of sludge other than land application. If they did want to alternate methods of disposal, they would need to develop more stringent numbers than federal limits, as was done by the Rockford Sanitary District.

20-955 O—84——61

4) Recognizing the fact that there are somewhat definable background levels and there are some threshold effect levels, then for some POTW's no pretreatment for industries may be necessary, while for others pretreatment requirements will vary greatly. The implication of this conclusion is that categorical standards, on a national level, may not be a rational approach to satisfying the objectives of the pretreatment program.

An existing State program which ties into the sludge management objectives of the pretreatment program is the sludge management program and specifically the IEPA Sludge Regulation Guidance Document. This program advises all sludge generators of the necessary Agency permits which are required. It outlines the principal categories of sludge generators and advises the generators of various disposal methods which are acceptable to the State. It also advises persons who store, haul, and treat sludge prior to final disposal of any required permits.

Other State regulations are included in Title 35: Environmental Protection Subtitle C: Water Pollution, Chapter 1. The USEPA in 1972 developed the National Pollutant Discharge Elimination System (NPDES) as mandated by PL 92-500. This program provided a benchmark to judge effectiveness of treatment process design to correct specific pollutional problems. The State of Illinois' implementation of this program began in October, 1977 and replaced the short term operating permit program developed shortly after the Illinois EPA's inception in 1970. The delegated NPDES permit establishes discharge limitations, including metals, and operational requirements tailored to the necessary stream within which a facility's wastewater treatment works discharge. Facilities unable to meet these requirements are placed on a schedule to achieve compliance. Strict enforcement of the permit provisions insures high level of Statewide compliance.

There are also criteria for sewer use. These State regulations, in effect since 1972, prohibit the discharge of the following wastes into a sewer:

a) Liquids, solids, or gases which may cause fire or explosion; may be injurious to sewers, treatment works, structures, or operation of treatment works; cause a safety hazard to treatment works personnel, or cause the treatment works effluent to violate applicable standards.
b) Solid or viscous wastes which obstruct flow in sewers or interfere with proper operation of sewers or treatment works.

The regulations also establish numerical limits for dischargers of mercury and cyanide to sewers.

In addition, State construction and operating permits are required for pretreatment facilities which will discharge greater than 15 percent of the POTW's load, or discharge toxic pollutants or pollutants which may

interfere with the POTW treatment process. Operating permits are required to be renewed every five years. The regulations also provide for the submission of operating reports to IEPA by permittees.

Authority and procedures for enforcement of the above requirements are contained in the State Environmental Protection Act. Routine field inspections are conducted at large on problem pretreatment facilities and indirect dischargers with no pretreatment. Facilities requiring permits are identified through field surveys and coordinated review of applications for air pollution, solid waste, or watermain extension permits. Compliance surveys at POTW's include, where possible, an evaluation of problems caused by industrial users.

Local Pretreatment Programs

Table 1 shows an evaluation of POTW's over 5 MGD flow with the number of categorical industries in each POTW, the number of industries currently monitored under the existing industrial user control program, whether the POTW has good industrial control, the percentage of industries monitored, and finally an assessment of the potential benefit of the federal program to improve local program control.

For 25 local jurisdictions representing about 2177 industrial sources, imposition of the federal model for pretreatment control would not result in any significant improvements in their existing local program. For 13 local jurisdictions representing about 364 industrial sources, imposition of the federal program would result in limited enhancement of their programs. Only one local jurisdiction representing 4 industrial sources stands to significantly benefit from use of the federal program. Thus, in Illinois we have a very positive situation in that nearly 86% of the industrial sources tributary to POTWs greater than 5 MGD are already being adequately controlled. The resource implications for state program efforts are obvious in terms of where additional emphasis is necessary.

A number of Illinois POTW's were further evaluated to determine the impact of the federal pretreatment program on their existing industrial waste control program. These POTW's were chosen based on their involvement in the development of a local program and their need, according to the regulations, to set up an approvable program. The results of the analysis are in Table 2.

These ten POTW's had from 0 to 1,500 categorical industries. The POTW's had either only a handfull of categorical industries or a large number. The ones with a few had no problems from the industries because the State requires pretreatment permits. The POTW's with a large number of industries all have very effective existing programs. In all the POTW's, the categorical industries which are to be monitored under the pretreatment program would be covered anyway by the existing monitoring program. The number of samples, visits or reports may increase, but the minimum requirement may still be met.

The methods of sludge disposal included storage on-site, landfilling, land application, and reclamation. Most POTW's had future projections toward land application. If this was a chosen option, then the IEPA would be directly involved with their sludge permits.

All POTW's carry out some treatment plant sampling. At a minimum there is sampling for NPDES permit requirements, sludge permit requirements and treatment process efficiency. This sampling includes both conventional pollutants and metals. The larger communities carried out organic anlayses with research-oriented sampling programs. It is also noted that the results of the sampling at the POTW's for organic and metals showed that these toxics were not showing up in the influent or effluent as verified also by the 40 POTW study done by USEPA.

Eight POTW's had metal limits in the existing ordinance. These limitation were based on State regulations or in-house data. One POTW had adopted State sewer use criteria for Hg, Cn, oil and grease. The other POTW which did not have any metal limits indicated in the lack of problems from industry for metal discharges and no categorical users. It was also very evident that the POTW's in the State required limits in the ordinance if there were problems from their industry but not if their users were minor or very small. Regarding the need to develop local limits, the treatment plant sampling showed that toxics were not being discharged and the conventional pollutants (BOD, SS, oil and grease) were limited according to the capability of the plant to treat. The program would probably not create additional or more stringent local limits unless a need was necessary, then this would have been done anyway.

Six POTW's had reporting requirements from industry, but usually only conventional pollutant analysis were required. In all cases, however, the POTW had the ordinance provisions to require reports and any type of sampling data from the industries.

Regarding industrial sampling, all the POTW's conducted some sort of visit to the IU, whether scheduled or random or both, and all facilities had the capability to conduct demand visits. Violations from reporting or sampling results were handled by the POTW's by set procedures, either directly written into the ordinance or at least provided by policy and procedures of the District. All facilities had chain-of-custody provisions and analysis of conventional metals, and organics were usually done in-house, while in some cases the orgainc portion was sent to a contract lab.

The POTW's were all very much aware of the regulations, however, notification procedures to inform IUs was usually not a standard operation, but facilities would informally let the IUs know of the upcoming developments as a courtesy.

All the POTW's had administrative procedures to deal with IU noncompliance based on the local ordinance. Three had policy requirements but even the policy was based on the ordinance provisions.

Only one facility had ordinance requirements to publish a list of significant violators. They, however, did not exercise this option. Most POTW's felt that this was not an effective method to deal with the industry. If there were violations of that significant nature, enforcement cases would have already taken place and the smaller industries would not really care whether their names were published or not.

There were mixed feeling between the POTW's on the availability of data to the public. Some felt that all of their information was public and would be available if requested. Others felt that even though effluent data should be given to the public, data generated in-house as a research tool should be kept secure. In most cases, however, there were confidentiality provisions in the ordinance and procedures to deal with requests for confidentiality.

The POTW's in this evaluation are all currently involved with the development of the Phase II portion of the program. For this activity they wold do an evaluation of the staff necessary to run the program on an on-going basis and an estimate of an annual budget. At this time it may be premature to attempt an exact figure due to the time frame, uncertainty of the regulations to determine the number of categorical industries, local limits have not been revised to protect sludge use, the vagueness of reporting requirements to the Approval Authority (USEPA or Illinois EPA), etc. However, the facilities did provide some kind of early estimate which ranged in staffing of no increase necessary to 17 people. The difference in the number is due to the impact of the categorical standards on the local industries. Annual budgets also ranged from no idea, to no impact, to $25,000 to $700,000/year. The wide range of numbers points out clearly the uncertainties of this estimate and that particular POTW's will be impacted a great deal more than others.

Legal Authority

All the POTW's have the authority to carry out certain requirements of the pretreatment regulations. What is not specifically written word for word, can usually be found referenced somewhere in the sewer use ordinance. Most of the procedural requirements are carried out by the POTW's irrespective of whether the specific language is included in the ordinance.

Conclusions

1. The existing sewer use ordinance for most of the major POTW's in Illinois are recent and up-to-date. They have been modified and adopted as part of the user charge system, existing plant problems, State criteria, etc. The general requirements of the pretreatment program are included in the ordinance while specific language may be missing. What is important, however, is that these facilities have the procedures to deal with the industries and this is evident for the POTW's evaluated.

2. While the paper work involved in developing the program identified specific tasks and organized the survey and technical portions of the program so that the POTW's became more involved in their industries, it was felt that the efforts by these POTW's would have been done irrespective of the national program as part of the State NPDES requirements, compliance actions, field visits, etc.

3. These communities have metal limits in their ordinance. The limit, in some instances, in the larger POTW's are more stringent than federal numbers. Local efforts may play a more important role than categorical standards if a problem exists. For the smaller POTW's there would probably be adoption of federal limits since it was felt that these numbers were not necessary in the first place.

4. In many POTW's, the problems that are evident do not concern organics or metals which the regulations deal with. Most problems occur from discharges of high strength BOD, SS, oil and grease, etc. For these communities local effort will be the key element here. Local effort through the State field office is an on-going activity of the State irregardless of the pretreatment program.

5. Categorical standards and going through the regulation is an immense resource intensive task for the POTW's. Problems encountered deal with applicability to users, production based number, calculating flows at end of process, difficulty of using the combined waste stream formula, adjusting to the ups and downs of the limits as each regulation is promulgated, etc.

6. The uncertainty of the pretreatment regulations is another difficulty faced. For example, removal credits is still in proposed form. What happens if national credits are not available and the removal efficiency varies from plant to plant within one POTW. According to the regulations, the lowest removal efficiency should be used.

7. The final point relates the ends achieved by the federal program. The major POTW's in Illinois are dealing with their industries on a day-to-day basis. What would be the result of the federal program beyond paperwork and administrative problems?

June 6, 1983

Steven Schatzow, Director
Office of Water Regulations
and Standards
U. S. Environmental Protection Agency
401 M Street
Washington, D. C. 20460

Dear Mr. Schatzow:

RE: Draft Report titled "Assessment of Industrial Waste Control Programs in Three Municipalities".

This letter will serve to respond to your request of June 6, 1983 for comments regarding the draft report prepared by JRB Associates. As you are aware, we did not receive our copy of the report until late last week. Thus, our comments only address the most substantive matters, and should not be construed as covering the full extent of our review of the draft report.

Please find attached our detailed comments regarding the draft report. As you will note, we express some serious concerns about the shortcomings of this report. However, given the very short time frame for doing the report, some problems are certainly to be expected.

In general, we are very encouraged that Congressional concern about the federal pretreatment program has resulted in this further technical analysis. Such work has been sorely needed from the very onset of the original proposals for federal pretreatment regulations. We also find the results of side-by-side comparisons of existing local pretreatment programs and the 403 federal pretreatment regulations to be most enlightening. In fact, this draft report has strengthened our resolve to ensure that the water pollution control program in Illinois is not weakened by the application of 403 regulations and national categorical pretreatment standards. We say this because our evaluation shows that imposition of the federal pretreatment program could result in <u>less stringent</u> control of industrial facilities tributary to MSDGC.

This draft report has served to confirm our worst suspicions that lowest common denominator, uniform national standards may turn into a ready excuse for backsliding in some parts of the country. I sincerely doubt that Congress intends for such negative effects to result from the federal program.

We also want to stress the misleading nature of the Executive Summary developed by the contractors for this report. For comparison purposes, we have prepared the attached point-counterpoint presentation that demonstrates a few of our concerns with this Summary.

Finally, we wish to emphasize a critical aspect of this effort that deserves further attention. On the positive side, we firmly believe that very useful information could be developed from a more detailed, extensive and objective study of current POTW pretreatment programs. If properly designed and funded by USEPA, such an effort could readily be done within a reasonable time frame (9 to 12 months), and be provided to Congress to assist the policymaking process for pretreatment. At this juncture, providing a sound technical basis for addressing the refinement of the CWA could be most productive.

We respectfully request that the full text of our comments be made part and parcel of any final report. We appreciate having the opportunity to provide comments on such an important issue. Hopefully, future consideration of this matter will take place such that all parties can participate as fully as possible.

Sincerely,

Roger A. Kanerva, Manager
Environmental Programs

IEPA RESPONSE - EXECUTIVE SUMMARY

Contractor Summary	*	MSDGC has operated an industrial control program for almost 15 years. It has submitted a Phase I pretreatment submission but has not developed a final submission at the request of the State of Illinois. It is unlikely that MSDGC will meet the July 1, 1983 deadline for pretreatment program approval.
Illinois EPA Response*		The Agency has included a schedule for the complete program development for MSDGC in the NPDES permit.
Contractor Summary	*	MSDGC plants are known to be well operated and maintained, and meet NPDES permits with over 99 percent consistency. All of the NPDES permits include metals, phenols, cyanide and conventional parameters, but limits for the metals are very lax.
Illinois EPA Response*		The effluent limits established in MSDGC's permit are based on State effluent limitations, or federally approved water quality limitations selecting the most stringent for each parameter.
Contractor Summary	*	The MSDGC IWS initiated by the State of Illinois in 1979 has not yet been completed.
Illinois EPA Response*		The industrial waste survey (IWS) referred to was a statewide survey (not done solely for MSDGC), and has been completed and available for use by MSDGC since 1980.
Contractor Summary	*	MSDGC has extensive metals analytical data for its POTW influent, effluent sludge, and for large dischargers, but lacks information on smaller categorical users. Insufficient information has been generated for organic priority pollutants, but an organics study is planned.
Illinois EPA Response*		Information for small industries may be available at MSDGC but not within the time frame requested by JRB. Organics have not been detected in large quantities as pointed out by the JRB report.
Contractor Summary	*	The NPDES permit allows many metal discharges in excess of typical POTW concentrations and water quality standards are not always attained in the MSD area.
Illinois EPA Response*		Water quality violation rates for metals in streams receiving waste from MSDGC facilities are significantly lower than those presented in the JRB report for most parameters when current water quality data is used. Further non-compliances are generally consistent with statewide averages indicating no unusual impact associated with MSDGC discharges.
Contractor Summary	*	Much MSDGC sludge is unsuitable for land application according to Illinois policy, and exceeds federal cadmium criteria for application to food chain crops.
Contractor Summary	*	Land application of sludge would require limitations more stringent than categorical standards in order to meet Illinois sludge policy.

Illinois EPA Response*	MSDGC sludge management program is consistent with Illinois requirements for land reclamation, cropping practices including food chain and non-food chain applications.
Illinois EPA Response*	USEPA has not fully defined through the promulgations of Sec. 405, CWA, regulations, the management and disposal of POTW sludge and the limitations on those practices.
Contractor Summary *	Approximately 1,000 additional categorical firms would be more agressively regulated.
Illinois EPA Response*	Illinois encourages cost effective selective regulation of significant dischargers as a part of its federally approved Annual Water Pollution Control Program Plan.
Contractor Summary *	POTW influent concentrations of zinc and chromium would decrease by an estimated 30 percent, and nickel and cadmium by less. Few other metals would be significantly affected.
Contractor Summary *	Up to 1,000 pounds of zinc and a like amount of chromium would be reduced in influent loadings daily at MSDGC's large plant as a result of categorical standards.
Illinois EPA Response*	Use of national categorical standards with removal credits results in a less stringent control program for heavy metals than is currently provided by MSDGC's sewer use ordinance. If MSDGC's demonstrated removal credits are used in place of the national values, then the benefit of the MSDGC ordinance system is even more significant.
Contractor Summary *	No improvement in the currently high rate of NPDES compliance is expected. MSDGC's limits are so lenient for metals that the influent to many POTW's could meet them.
Contractor Summary *	An improvement in compliance with a few State water quality standards may be expected.
Illinois EPA Response*	MSDGC permit limits are consistent with both Illinois effluent and USEPA approved water quality standards necessary for protection of designated uses.
Contractor Summary *	MSDGC's costs would increase by $640,000 annually with little or no additional capital expenses needed. This equates to $360 annually for each of 1,800 categorical industries, or an increased level of effort at MSDGC of 14 man years.
Illinois EPA Response*	Agency experience indicates an estimate of MSDGC's cost increase by $640,000 is low

ILLINOIS EPA COMMENTS ON DRAFT REPORT
PREPARED BY JRB ASSOCIATES

III-2, Section 1.1

1. The final program submission date in MSDGC's NPDES permit of December 1982 plus the July 1, 1983 Federal Register date has lost their significance for workable pretreatment schedules. These dates were tied into the municipal compliance date which was subsequently pushed back to 1988. Pretreatment guidelines have also been delayed. The Illinois EPA is working towards new target dates which are consistent with the Pretreatment Standards and working with the local POTWs for realistic pretreatment schedules.

2. The Illinois EPA is requiring the development of the entire pretreatment program in MSDGC's and other POTWs permits. Due to resource constraints and delays in review procedures between USEPA and IEPA, we are currently reviewing the Phase I portion of the program.

3. The Illinois EPA has been enforcing the individual items in the Phase I portion of the POTW NPDES' permit. If a community has not initiated any action, or has received a grant and not started work, the Illinois EPA has been actively involved. We are not initiating any compliance actions with MSDGC since they have submitted Phase I and portions of Phase II.

III-15, Section 1.4

The "Receiving Waters" section contains a serious misstatement of Illinois' stream classification system. On page 15 the contractor states "all waters not suited for general use are classified as Restricted Use, Secondary Contact and Indigenous Aquatic Life". First, the water quality standards were modified to exclude the concept of "Restricted Use" in 1973. The change was made at the request of USEPA and included changes in both terms and supporting numerical criteria. Second, the classification of "Secondary Contact and Indigenous Aquatic Life" waters is the result of specific and detailed assessment of water quality needs of an identified group of waters not, as the contractor implies, a "catch-all" classification to permit degraded water quality. The waters classified for this use have serious habitat limitations, and most are subjected to intense commercial barge traffic and urban stress. In many cases, water quality is not the factor limiting uses of the streams.

III-19, Section 2

MSDGC officially submitted Phase I in October, 1980. Much of the additional information required in Phase II is contained in the additional documents which MSDGC gave to both Illinois EPA and JRB at the Chicago meeting on May 9, 1983.

III-19, Section 2.1

The existing MSDGC sewer use ordinance, like most municipal ordinances, does not contain the specific language needed to implement a model pretreatment program such as that envisioned by USEPA. It should be noted, however, that these "wording differences" do not make an existing program any less efficient.

III-23, Section 2.1.1

1. The contractor does not take into consideration the actions which MSDGC would take when modifying their ordinance. MSDGC has the capability to modify and add language as appropriate as has happened in the past. If a minor language additions are necessary, (for example the word "interference", temperature set at 104 F rather than 150 F, or pH of 5.0 rather than 4.5) this could probably be easily remedied.

2. The 403 pretreatment regulations allow the control mechanism to be contained in "a statue, ordinance, or series of contracts or joint powers agreements which the POTW is authorized to enact, enter into or implement, and which are authorized by state law." This provision does not specifically require setting up other procedures such as a permitting system as long as the existing system is adequate.

III-31, Section 2.2.1

1. MSDGC did not really have two full weeks to respond to the request for a summary listing of industrial flows by SIC code. The Illinois EPA has been repeatedly telling the POTWs not to rely on SIC code lists as indicators of industrial problem discharges; the POTW should concentrate on surveys, field visits, sampling, past history, etc., which would point out their problem users. To accomplish the consultant's request MSDGC would have to reorganize the data. This does not mean that the information is not available.

2. The consultant has stated that the control of organic dischargers using MSDGC files is impossible because theyhave focussed their efforts on metals and conventionals. The sampling reports and the JRB report showed that "the number of organic priority pollutants detected at all MSDGC POTW's and their concentrations are lower than average". Why then should MSDGC initiate more control of organic dischargers?

3. While the consultant had access to the final Illinois Industrial Waste Survey Report, and the numerous summary reports, they apparently did not obtain an understanding of the original intent of the survey. The survey was initiated primarily to provide an organized technical foundation for use by management in the development of Illinois' pretreatment and RCRA programs. Over 20,000 industries were surveyed. The purpose of the IWS was not to develop detailed "permit application type" data, but rather to identify as many industries as possible who might be subject to the program, and to generally characterize their waste. Since it was known that 100% response was not possible, a secondary purpose was to be able to extrapolate the collected data into various summary reports which would provide management with the scope of the programs statewide.

   Once the survey was finished, data was collected on a POTW by POTW basis and transmitted to each POTW in the program. In some instances the POTWs were provided with copies of management reports. MSDGC was provided with all the raw data collected from IWS which would concern MSDGC. Thus, the IEPA's intent was to provide the POTWs with a foundation from which to build, and initiate local surveys which would suit local needs.

   It should be noted here that the survey was essentially a state supported effort exclusive, except for one activity, of any federal funding. The survey was designed to have an initial questionnaire mailing and one follow-up in order to improve the response rate. In order to make the follow-up more effective, the help of several larger POTWs was solicited. Their function was primarily to call industries and urge them to respond. Their effort was, in part, funded by grant monies since this was a function of local program development.

   In response to a comment on page III-30 that the survey was a "joint effort" it should be noted that while IEPA greatly appreciated MSDGC's assistance, the IWS could hardly be considered a joint effort.

   On page III-31, it is alledged that Region V reviewed the questionnaire and "... found fault with it for using the list of 65 pollutants and classes of pollutants rather than the current list of 126 priority pollutants". To the best of IEPA's recollection Region V never formally responded to IEPA on any of the survey. Also, the contractor makes an observation on the same page that "... the questionnaire failed to request quantitative data...", which implies that the survey was at fault somehow for failing to obtain "quantitative" data. Notwithstanding the contractor's lack of documentation, in response to these comments it should be remembered that the purpose of the survey was to identify industries subject to pretreatment, and not to collect "permit application" type data. Many of the 20,000 industries the survey was sent to were very small and it was felt a smaller list of pollutants would be more honestly identifiable by many more industries. Asking for "only" sixty-five pollutants has served the survey's purpose.

20-955 O—84——62

To attempt to identify quantitatively all the data would have been impossible in the time frame allowed, simply because of a lack of laboratory available. It was envisioned that quantitative data would be collected in baseline reports after categorical guidelines had been developed.

The contractor also alledges, on page III-31 that the "...IWS is unfinished..." and that "... summary results of the IWS for the MSDGC service area have not been compiled or made available to MSDGC." The IWS was completed in 1980 and MSDGC has been sent all the data for its service area. A copy of the final report and MSDGC data is available at IEPA's offices.

The contractor states that since the MSDGC data base cannot readily sort by SIC codes it is somehow not in compliance with federal regulations. It should be noted that there has been increasing awareness that SIC codes frequently are inaccurate, or don't adequately describe the regulated community. USEPA, who has sponsored this report, does not even use SIC to identify industrial categories, in formal regulations. In some cases a general discussion of the industrial category and SIC is briefly presented, but in other instances (e.g. coil coating) no SIC reference is presented since the category spreads over many industrial categories.

The closing statement to this section states that MSDGC does not have a completed IWS "...due to delays on the part of IEPA...". This statement is judgemental on the part of the contractor in presuming the MSDGC data base is inadequate, and further alledges <u>without documentation</u> that IEPA is somehow responsible.

<u>III-34. Section 2.2.2</u>

1. The consultant pointed out that the metal concentrations in WSW effluent are higher than other POTW effluents. Is the comparison to other POTWs or other MSDGC plants? Are these numbers really significant? What about the level of treatability? It should be noted that WSW is still meeting State NPDES limits.

<u>III-39. Section 2.2.2</u>

1. The consultant once again pointed out the higher than average removal rate for metals by MSDGC as compared to the 40 POTW Study and the improvement in removal from 1977 to 1982.

2. A statement was made that the "concentrations of metals in MSDGC sludge are judged to be high." On what basis was this observation concluded? The Illinois EPA has sampled over 700 POTW sludges in 400 communities and we have prepared a document (which was given to JRB) entitled "Pretreatment-The Relationship of Industrial Loadings to Municipal Sludge Quality - A State Perspective" which discusses the background levels found throughout the State. Based on these background levels of Cadmium (10 - 30 PPM), Chromium (750 - 1000 PPM), Copper (1000 - 2000 PPM), Nickel (100 - 400 PPM), Lead (500 - 1000 PPM), and Zn (2000 - 4000 PPM), MSDGC's levels do not present a significant sludge management problem.

III-43. Section 2.2.3

On page 43 of the contractor's report (first full paragraph) it is stated that in 1972 "...NPDES effluent limitations superseded State standards..." At this time that the federal amendments were adapted 1972, Illinois already had in force detailed effluent limits which were roughly equivalent to BAT. Even today when many of the BAT development docuemnts still have not been finalized, the Illinois EPA standards have provided the basis for permit limits and sewer ordinances for more than ten years.

III-49. Section 2.3.2

1. The contractor found fault with MSDGC's program to focus on problem facilities. However, this is analogous to the approach used by USEPA for the direct discharger program in which emphasis was placed on the "major" industries due to resource constraints.

2. The manifest system discussion should be expanded due to the importance of this mechanism by MSDGC to control discharges.

III-55, Section 2.4.1

1. The consultant is recommending a shift towards a broader less intensive monitoring strategy which would minimize the need for additional personnel. This approach would in effect decrease the existing effects on the 800 problem dischargers and create more work with the other 1,000 less significant industries. This would add to one facet of the program while taking away from another with net reduction in total effectiveness.

2. JRB has emphasized that "absolute numbers" rather than production based standards would be effective in detection of non-compliance. Contrary to this admission, the contractor then advocates the federal production approach in lieu of the MSDGC ordinance.

III-60, Section 2.4.2

1. The estimate of less than 1% of total budget allocated to the Industrial Wastes Section is a misrepresentation of MSDGC's program. The contractor included construction and design funds in the total MSDGC program which significantly distorts the proportion of operating resources committed to industrial control.

2. Illinois EPA has long maintained that local pretreatment ordinances can be as effective as the federal pretreatment program. JRB has provided documentation of this result by referencing the 70% reduction of influent metals associated with the MSDGC system from 1971 to 1976.

III-63

Table 17, 18 and 19 attempts to point out the maximum possible industrial contribution. Even the categorical standards do not attempt such an extreme scenerio. This obvious "worst-case" approach simply is not consistent with the real world. Interestingly enough, if one chose to accept the contractor's rationale, the tables do not support the contention that MSDGC's ordinance levels would result in significant adverse effects.

III-66, Section 2.5.2

There does not appear to be a sound basis for the implication that MSDGC is not enforcing ordinance limits for lead. Lead concentrations may be from only one or a few dischargers and not a significant number of IU's as indicated. There may also be lead packing of the pipes and leaded gasoline contributions.

III-67, Section 2.5.3

"Ability to Meet NPDES Permit" reflects a misunderstanding of Illinois' regulations and their supporting justification. The contractor implies in several sections of his report that both the effluent and water quality standards that govern the dischargers from MSDGC facilities are too lenient and are based on inadequate data and obsolete analytical techniques. This is clearly not the case! The standards on which MSDGC permits are based were adopted only after extensive hearings before an independent adopting authority, including both technical and public input. The regulatory process provides for continuous review and when necessary, revision of the standards. Regulatory limits must reflect a wide variety of considerations including environmental impacts, treatability and economic impact. The USEPA approved the original standards and all subsequent revisions. Although professional judgement is a significant element of any standards setting process, the implications that BPJ (Best Professional Judgement) as a "best guess" concept was used in standards setting is a misrepresentation of the review and revisions process being used in Illinois. Our water quality and effluent standards are among the most comprehensive in the nation and are consistent with USEPA's "Quality Criteria for Water" in general use waters. Finally, none of the standards discussed in the contractor's report were based on limits of analytical detection either in 1972 when the standards were originally adopted or currently. The MSDGC permits have been established to assure compliance with both effluent and USEPA approved water quality standards necessary to support the designated use of the receiving stream. The cyanide permit limit referenced in this section for the Calumet plant was developed by USEPA prior to IEPA NPDES permit authority. The Calumet NPDES permit now being public noticed establishes effluent cyanide limits consistent with Illinois standards (0.15 mg/l as an effluent) which assures protection of water quality of the receiving streams and reflects current discharge levels. The new effluent limits are the result of formal regulatory process not negotiations with the dischargers.

III-71, Section 2.5.4

"Protection of Water Quality" continues the misconceptions concerning the technical justifications for Illinois' standards and the means by which NPDES permits reflect those standards. Discussion of BPJ is contained in our comments on Section 2.5.3 as is the effluent limit on cyanide for the Calumet plant. The ammonia, BOD and suspended solids limits contained in MSDGC permits came directly from Illinois effluent and water quality standards and are the result of much more extensive justification than simple waste load allocations modeling. As with other

parameters in MSDGC permits effluent limits are established to assure compliance with USEPA approved water quality standards.

This section also contains many misleading statement concerning water quality in the streams receiving MSDGC discharges and an apparent lack of understanding of typical ambient water quality level in Illinois streams as well as probable sources of pollution on the part of the contractor. On page 71, the report states that the streams receiving MSDGC discharges are "water quality limited" implying that effluent limits being imposed on MSDGC will not be adequate to assure attainment of water quality standards. In fact, all streams in Illinois are currently classified as "water quality limited" as a result of an unresolved dispute with USEPA over the use of more stringent (than BPT) Illinois effluent standards to determine the adequacy of point source controls. Once the facilities contained in Illinois' approved 208 plan are in place, point sources will not contribute to water quality violations. Final permit limits for MSDGC treatment plant effluents and combined sewer overflows reflect the requirements of the 208 plan.

The discussion of "current water quality levels of MSDGC receiving streams is both misleading and out of date. Current ambient water quality data at points downstream of MSDGC dischargers indicates violations rate of applicable water quality standards for parameters discussed in the contractors report as shown in the attached table. Values in the contractors report are parenthetically included. Statewide average violation rates are also listed for reference and to provide insight into background levels.

As can be seen from the attached tables, the violation rates for the "parameters of concern" in MSDGC receiving streams is not alarming when current data is used and compared to statewide averages. The raw violation rates for the DesPlaines and Salt Creek are somewhat higher than state averages, but are far from unusual due to the geology of Illinois watersheds. There is absolutely no reason to believe that discharges from the MSDGC are contributing to these raw water water quality violations. It is unclear why the contractor chose to present data on violations in the Little Calumet River and North Branch of the Chicago River. In addition to having the same errors that are contained in the other violation summaries, these streams receive no waste from MSDGC facilities.

III - Pages 74 through 83, Section 2.5.5

This section views the protection of MSDGC sludge quality as if a predefined quality exists in the regulatory framework either state or federal. This is not the case. The regulations called for under Section 405 of the Clean Water Act of 1977, and the Water Pollution Control Act of 1972, have not been promulgated or proposed. Only a small portion of a program exists under 40CFR257 which is limited in application. Thus a federally defined sludge quality does not exist.

The State of Illinois program does provide a definition of sludge quality for sludges to be applied to agricultural land at agronomic rates. However, the state program recognizes that other forms of sludge management or disposal are available and may be desirable at the local level. These rationally designed programs are not prohibited and are in fact approved utilizing a permit system.

Fulton County Site

The Fulton County Project was compared by the contractor, JRB, Inc. to the criteria contained in State of Illinois guidance material. This comparison is invalid for the following reasons.

1. The Fulton County Project was initiated in 1971, with the first sludge applied in 1972. The Illinois policy for applying sludge to agricultural land was published in draft form in 1977 and has been under review and revision recently leading to promulgation as regulation shortly. This policy in draft form has and the regulations will continue to allow reclamation projects to be developed on a rational basis.

2. The Fulton County Project was preceeded by extensive studies by the University of Illinois on MSDGC sludges and their effects on crops. These studies formed the bases for the design of the project which also included as a goal reclamation of unproductive strip-mine land.

3. The Fulton County Project was accompanied by an extensive monitoring program including groundwater, soil, surface runoff, and crop tissue. The crop tissue monitoring is conducted under the review of the U.S. Department of Agriculture with approval being given by the DOA prior to marketing of the grain crops.

4. The monitoring of the Fulton County Project is more intensive than that envisioned by the State sludge policy for a normal sludge application site.

5. The application of sludge and the monitoring of the total program are defined by State of Illinois permit. The last permit was issued October 6, 1981, and continues in effect until December 31, 1983, at which time the Illinois EPA will consider renewal.

6. The Fulton County Project provides for retention of surface run-off until the quality can be determined to meet the conditions established by the October 6, 1981, permit. The ability to recycle substandard run-off exists.

7. Groundwater quality at the site has to be reviewed carefully, taking into account the previous quality changes which are the result of strip mining influences.

Source: Illinois Ambient Water Quality Data from "Illinois Water Quality Inventory Report - 1980 - 1981" (305b Report)

Doty Reclamation Site

The contractor has compared the operations at the Doty Reclamation Site with the criteria in 40CFR257. This comparison is between practices at a site which has a history of uses with practices outlined in 40CFR257 which are basically applicable to a greenfield or virgin site. This direct comparison is invalid.

The 40CFR257 regulations address disposal operations and do not envision reclamation.

The project at Doty is designed to minimize existing environmental impacts through reclamation as the site and the establishment of a grass cover utilizing sludge as a medium to sustain growth. The aim of the project is to cap the site minimizing water penetration and erosion on the surface of the cap.

III Pages 86 through 91 Section 3.1.1.2

Evaluation of Table III-28

This table, which purports to show the improvements in metals reduction attributable to categorical standards, fails to address the impact of removal credits. Since MSDGC would appear to qualify for either national removal credit, or removal credits based on demonstrated capabilities a revised version of the table is presented later.

In preparing the revised table the national removal credit and removals based on 1982 data are shown:

Metal	National Removal	MSD Removal		
		WSW	North Side	Calumet
Cadmium	38	82	100	NI(1)
Chromium	65	93	98	ID(2)
Nickel	19	45	79	NI(1)
Zinc	65	82	76	50

(Refer Table III-9)
NI - none in influent
ID - insufficient data

Copper and Lead are not shown since there would be no substantial improvement due to categorical standards.

III-107. Section 3.2.2

The contractor's estimate of the additional financial cost for implementing the federal program appears to be very conservative. Based upon our experience with the federal pretreatment program, we anticipate that the cost would be significantly higher than projected by the contractor. The major municipality in Illinois has completed the process of revis their pretreatment program to meet the federal requirements. In this instance the POTW projected an increased cost of $191,000 for the implementation of the federal program to regulate approximately 69 categorical industries. Extrapolation of their increased expense to the MSDGC system would provide an estimate of about $4.4M per year based on 1800 categorical industries. While this method of projection of MSDGC's cost is admittedly still rough, at least it is based upon actual experience with implementation of the federal program.

SUMMARY OF ILLINOIS WATER QUALITY MANAGEMENT PLANNING PROCESS

Introduction

The current Illinois Water Quality Management Plan is an operating part of the overall water pollution control program administered under the Clean Water Act and related state law. This Plan covers programs for control of both point and nonpoint sources of pollution. The existing program is responsive to the resource analyses, findings and recommendations of the initial State and Areawide Water Quality Management Plans developed pursuant to Section 208 of the Act. These plans recognized the significance of nonpoint source pollution and recommended action programs to control these sources where necessary. This included identification of those areas where nonpoint source control programs could act in concert with established point source control initiatives. This linkage evolved in three phases.

Phase I Basin Plans, prepared in 1976 under Section 303(e) authorization, identified the categories and extent of nonpoint source pollution which guided efforts resulting in the certification and approval of Phase II water quality management plans for three designated areawide planning agencies and the State in 1979. Since 1979, Phase III work has been conducted with Section 208 and 205(j) funds and extensive progress made towards the careful integration of this type of planning activity into the on-going water pollution control program base.

The major focus of current water quality planning and program efforts is to continue to provide a transition from planning to implementation. The principal guiding policy is the refinement of current programs and authorities to respond to the problem of nonpoint source pollution control. The Continuing Planning Process (CPP), as defined in Section 303 of the Clean Water Act, is the overall mechanism used in Illinois to accomplish this transition.

The Continuing Planning Process for Water Quality Management

The Federal Water Pollution Control Act Amendments (FWPCA) of 1972 established a series of related programs for setting water quality standards, constructing municipal wastewater treatment plants, issuing permits for wastewater discharges, enforcing discharge permit conditions and establishing a broadly based planning process for water quality management (WQM). The WQM program is oriented towards implementation of abatement strategies for the control of point and nonpoint sources of pollution. The purpose of the CPP is to define the framework to target resources toward both these problem solving approaches. The process provides for the following:

1. Continuity between the annual program plan and longer term direction.
2. Transition between program base elements and new initiatives.
3. Technology/institutional approach assessments.
4. Intermedia program interface.
5. Mechanism to identify and assess conflict resolution needs.
6. Local, State and Federal coordination.

As a result of Phase I Basin Plans and Phase II Water Quality Management Plans, the following pollution control problems were identified as the basis for planning and program refinements with the context of the CPP:

1. The Illinois Pollution Control Board water quality and effluent standards are based on fixed levels of various contaminants. The present standards were not developed with nonpoint pollution sources in mind. A program has been initiated to examine the levels of protection of water quality needed to support indigenous aquatic communities as well as present or future cultural uses of waters of the state.

2. The initial WQM planning program provided an examination of the urban stormwater problems in eight nondesignated area Standard Metropolitan Statistical Areas (SMSA) and in the Chicago designated area. While some recommendations were given in the initial Section 208 plans, it was not possible to fully address urban stormwater problems at that time. Subsequently input from the National Urban Runoff Program (NURP) is being integrated into Illinois programs now that the results are known. Urban runoff continues to be a problem area.

3. Past water quality assessments have indicated ground water inflow to streams as a possible significant impact on surface water quality. Although ground water data have been collected in the past, this data has not been centralized. Work done in the Phase III portion of the WQM program compiled data so that adequate problem assessments could be completed in certain areas of the state. Priority ranking of these areas, based on susceptibility to both point and nonpoint source inputs, is the next major step for this portion of the WQM Program.

4. In the public participation efforts of the initial planning process, citizens identified a strong desire for lake water quality protection and restoration for both recreational and public water supply uses. The State has developed an adequate base of chemical and physical lake data. Provisions for technical assistance and implementation of restoration and water quality protection programs are needed.

5. The predominant nonpoint problem associated with agriculture was identified as soil erosion and sedimentation in WQM studies. Other problems include fertilizers and pesticides tied to soil erosion and small livestock feedlots. Of nonpoint source problem areas identified during the initial planning process, the majority of the work conducted during Phase III was devoted to agricultural nonpoint problems. Although significant progress has been made towards controlling soil erosion through cooperative agreements with agricultural agencies, there are inherent limitations in these efforts. The major limitation is the tendency of agricultural agencies to gear soil erosion control efforts primarily towards the maintenance of soil productivity rather than the protection of water quality.

6. Little effort had been devoted to the examination of the quantity/quality relationship in water management. It is known that quantity considerations apply to standards determinations, lake management, ground water availability, and public water supplies. Therefore, some future WQM efforts need to be directed toward addressing this relationship. Additional expenditures are needed to ensure the incorporation of environmental concerns into traditional engineering designs.

7. Drainage from coal mining areas has long been identified as a significant problem in the southern portion of the state. Arrangements under the federal Surface Mining Control and Reclamation Act have become clear allowing the opportunity for some water quality issues pertaining to mining to be included in this program. However, the problem of water quality degradation from orphaned mined lands still remains.

8. Other non-point source water quality problems to be addressed in Illinois include non-coal mining, construction erosion, hydrographic modification, residual wastes and oilfield brine. While many sources of pollution have been defined and methods of control determined, the ability to effectively integrate these results into a feasible control program for any specific watershed must be addressed. The capability to develop optimal technical and institutional solutions for both point and all nonpoint sources is essential.

As part of the continuing planning process, the Agency consolidated approved State and Areawide WQM Plans in order to maintain the momentum of the Section 208 program. This consolidated State and areawide plan called the "Illinois Water Quality Management Plan" serves as the focal point for the continuing process of water quality management planning in the State for both point and non-point sources.

Follow-on to Section 208 Planning in Illinois: A Transition to Implementation

The State of Illinois had actively participated in the water quality management (WQM) planning process, as characterized by Section 208, since the first expenditure of funds under this program in 1975. Between the federal fiscal years of 1976 and 1981, over 20 million dollars was committed to this process in Illinois. With the cessation of funding for

Section 208, the Illinois EPA was faced with several critical decisions with regards to the water quality management planning process in place in Illinois.

Over the past several years, the Agency had been preparing for the continuation of water quality management planning activities upon the completion and phase out of Section 208 sponsored activities. Proposed transitional and follow-on WQM planning activities were predicted on the belief that a certain continuity should be maintained between former Section 208 initiatives and those tasks which could be in part supported by Section 205(j) funds. This included identifying ways in which the current WQM planning process could be directly merged into daily water pollution control program activities.

Several types of activities were proposed for Section 205(j) funds based on this assumption. One of these activities involves areawide WQM planning agency support for Agency water pollution control programs. During the past calendar year, the Agency has made a concerted effort to review and consolidate existing State and Areawide WQM Plans. This consolidation and revision process served to anchor future WQM planning activities under Section 205(j) to program needs in relation to the NPDES, Construction Grants, water quality assessment and non-point control activities. The objective was to establish a series of activities which support, in an operational fashion, on-going water pollution control activities.

During the first transitional year, the three currently designated water quality management planning agencies, are involved with Section 205(j) funded activities on a direct contractual basis. This is in line

with the orderly development of a water quality management planning program supported in part by the involvement of these types of organizations. The basic nature of areawide WQM planning support centers on WQM Plan consistency reviews, conflict resolution related to consistency reviews on NPDES permits, construction and operation permits and Construction Grant issuance as well as a series of special water quality assessments. These special assessments include continued oil field brine damage investigations, groundwater resource inventory and evaluation and continued review of urban runoff impacts on Lake Michigan water quality.

The overall planning process has supported base information, problem assessment, strategy development, transfer programs, and implementation initiatives. Continued efforts will be made to further address major problems of point and agricultural non-point source pollution. In addition, emphasis is being made to further address problems on a regional and local basis and provide adequate support to facilitate problem resolution.

The Illinois Water Quality Management Plan

The consolidation of State and areawide WQM plans provided the following benefits from both a state and local perspective by:

1. Providing a concise compilation of pertinent data needed in consistency determination for grant and permit issuance;
2. Formating existing WQM plans into a standard style to simplify their use and eliminate unnecessary information or support documentation;
3. Clearly specifying roles and responsibilities of designated management agencies;

4. Establishing a simple routine process to update and amend the WQM plan through the use of DWPC's Annual Program Plan;

5. Incorporating water quality mangement considerations into base program (Sections 106 and 205(j)) activities and;

6. Defining the minimum water quality management planning requirements for plan continuity.

The consolidating of State and areawide WQM Plans was undertaken in two distinct parts. Part of this effort has entailed the development of a document entitled 208 Planning in Illinois. This report contains abstracts for all FFY 1977 through 1981 projects completed with WQM planning funds by the respective State or areawide planning agency. This provided a convenient compilation of 208 work activities and facilitates information transfer among interested parties. The second part of this effort was the consolidation of the State and areawide plans themselves.

The purpose of integrating the Illinois Water Quality Management Plan (IWQMP) within the overall program was to consolidate and streamline portions of approved State and Areawide WQM plans in order to facilitate their usage in the operations of all designated WQM agencies. The WQM Plan represented a joint effort by the four agencies with WQM planning responsibilities. The four agencies involved were: Illinois Environmental Protection Agency, Greater Egypt Regional Planning and Development Commission (GERPDC), Northeastern Illinois Planning Commission (NIPC) and the Southwestern Illinois Metropolitan and Regional Planning Commission (SIMAPC).

There were several reasons which promoted the unifying of existing state and areawide plans. The first was the need to compile existing WQM plans in a convenient administrative format. At the state level, there was a need to improve the process of WQM Plan consistency review for NPDES permit or Title II Construction Grant determinations. For local

20-955 O—84——63

officials there was a need to clearly define designated management agency responsibility and highlight recommendations for future action. This was a necessary step in the continuing process of WQM plan implementation.

A second reason for WQM Plan consolidation was to provide an orderly transition from plan development to implementation of programs. There has been a considerable public investment to establish credibility in the process Section 208 created, both from a planning and implementation standpoint. The cessation of funding for Section 208 WQM planning had resulted in the need to incorporate this planning process into the ongoing Agency water pollution control program.

Annual updates and amendments to the Plan are published in the Illinois EPA's Division of Water Pollution Control Program Plan. The Program Plan serves as a vehicle to circulate and document Plan changes. The amendment process for point sources is conducted in accordance with the adopted "Procedures and Requirements for Conflict Resolution in Revising Water Quality Management Plans", which are part of the Illinois Administrative Code.

The following pages contain a brief synopsis of the continuing policies and recommendations found in the Illinois Water Quality Management Plan.

Chapter Two -- Point Source Control: Control of point sources in Illinois is provided through the regulatory structure established by the Illinois Environmental Protection Act (Act) and subsequently through the Illinois Pollution Control Board (Board) Rules and Regulations. The emphasis of the Illinois WQM Plan for point sources is directed specifically towards NPDES and construction grant determinations and their conformance with the Illinois WQM Plan. From a statewide

perspective, the control of point source discharge is a necessary component in a comprehensive strategy for water quality management. The primary responsibility for control of point sources is shared between the State and local designated management agencies.

* The emphasis of the WQM Plan is to ensure that those State and local programs involved with point source control are carried out in an efficient and effective manner.

* It is the primary responsibility of the State to ensure that the process of construction grant award, NPDES permit issuance and compliance monitoring are undertaken in accordance with all applicable state and federal requirements. The issuance of new NPDES permits constitutes an amendment to the approved WQM Plan.

* Local designated management agency are primarily responsible to ensure the quality of its effluent, the efficient provision of service within its facility plan area, the effective enforcement of applicable sewer use and pretreatment ordinances as well as the encouragement of water or energy conservation strategies (as appropriate). Facility plans should be implemented by local designated management agencies as approved by Illinois EPA. Amendments to these plans should be conducted in accordance with established Agency procedure.

* Continued regulation of combined sewer overflows is a beneficial and essential element of an effective statewide WQM plan. Local treatment authority plans for controlling combined sewer overflows must comply with applicable Pollution Control Board rules.

Chapter Three -- Agriculture: The control of water quality impacts from agricultural activities is the foundation of a comprehensive strategy for the abatement of nonpoint source pollution. The responsibility for control of agricultural nonpoint source pollution is shared among federal, state and local agencies and the individual farm operator and is based primarily on a program of voluntary compliance. The policies and recommendations contained in the plan reflect the institutional and program changes which were first suggested in the initial plan in 1979.

* The WQM Plan recommends expanded development of a program of education and research efforts directed towards agricutural nonpoint source pollution in five primary areas of concentration: erosion and sedimentation, livestock waste management, silviculture, pesticide use and fertilizer application.

* The Illinois Department of Agriculture and the 98 soil and water conservation districts have continued responsiblity for technical services, cost-sharing and direction of the soil erosion control program.

* The Illinois Environmental Protection Agency (IEPA) and the Illinois Pollution Control Board (IPCB) have continued responsibility for water quality monitoring, progress accountability and enforcement of the provisions of the water quality related elements of the agricultural nonpoint source control program.

* The State has the primary responsibility for assuring the efficient and effective use of fiscal, technical and personnel resources related to soil erosion and water quality nonpoint management objectives. Local, state and federal agencies should cooperate to assure adequate compliance monitoring and assessments are made. Local voluntary support is encouraged.

* The State, through the Department of Agricultre, should continue to provide funding to accelerate the rate of soil survey completion in order to provide full coverage of the State with modern surveys.

* The Illinois EPA should continue to upgrade and refine its program for administering the Illinois Pollution Control Board's Livestock Waste Regulations (Agriculture Related Pollution, Ill. Adm. Code, Title 35, Subtitle E, Chapter I, Part 501). Problem feedlots will continue to be prioritized on a "worst case first" basis for follow-up action. Compliance with existing regulations should be pursued on a voluntary basis whenever possible. To defray compliance costs, livestock operators should be informed of sources of financial relief and lower cost alternatives for waste management.

* The Illinois Department of Conservation, Division of Forest Resources and Natural Heritage (IDOC-FRNH) is the primary agency responsible for directing technical assistance and educational programs for forestry operations. The recommendations contained in the State Forest and Related Resources Plan, developed by IDOC-FRNH, should be implemented.

* Reduction in fertilizer contributions to high nitrate concentrations and elevated nutrient levels should be controlled through sound fertilizer management practices.

* Continued emphasis should be placed on the development and implementation of an effective program of pesticide waste management.

* Cooperative agreements should be undertaken by the Agency with other State and Federal agencies to evaluate pesticide problems resulting from their use in agricultural production. Pesticide use surveys and water quality monitoring programs should be coordinated and effectively employed in the evaluation process.

* Integrated pest management programs are encouraged.

Chapter Four -- Construction: The emphasis of the WQM Plan, with regard to construction nonpoint source control, is preventative in nature. Construction nonpoint source pollution is not as widespread as other types of nonpoint source pollution in the State, but when it occurs it is usually significant. Effective programs for mitigating the impacts of construction nonpoint source control can be established using existing techniques and authorities. This is especially true at the local level. Additional coverage of this problem can be through improvement in administrative procedures and site practices by the developer of a site, whether they be either a private or public entity. From a statewide perspective, the control of construction non-point source pollution is a necessary support to the agricultural erosion and sedimentation control program.

* The WQM Plan emphasizes the development of technical and administrative guidance tools to assist responsible units of government and agencies in the selection of best management practices (BMPs) and administrative mechanisms for the needed nonpoint source control.

* Designated Management Agencies (DMAs) responsible for the control of construction nonpoint sources include municipal and county governments, soil and water conservation districts throughout the state as well as various state agencies (IEPA, IDOT, IDOC, and the ICDB).

* It is the primary responsibility of the state to control construction nonpoint source pollution arising from state

sponsored or directed activities. State Agencies responsible for regulating and reviewing construction related activities, such as IEPA, IDOT, DWR and IDOC, should consider necessary conditions in permits for water resource related projects to prevent pollution from these activities.

* All counties and municipalities should carry out some or all of the following preferred control practices for local nonpoint source pollution: Adopt and enforce standards and specifications for erosion and sedimentation control in developing areas; Adopt and enforce model ordinances which contain minimum standards for control in those areas currently under development; and where possible, better use of both local and state personnel, through training and education programs.

Chapter Five -- Urban Runoff: From a statewide perspective, the control of urban runoff is a necessary component to prevent impairment of water uses in an urban setting. Local units of government have primary responsibility for the control of urban runoff. Urban runoff studies in eight standard metropolitan statistical areas across Illinois indicated that lead, copper and iron exceed the existing general use water quality standards 25 to 30 times per year as a result of urban runoff at various points within each study area, and that the once a year maximum may be 15 to 20 times the standard. The Plan stresses three ways to reduce urban runoff pollution: 1) by controlling the design, construct, and maintenance of the drainage network; 2) by preventing polutants from entering the drainage network; and 3) by treating stormwater to remove pollutants before polluted runoff reaches a waterway.

* Research which will give technical and administrative guidance to the responsible units of government should continue. This includes continued analysis of National Urban Runoff Program (NURP) results to maximize its transferability throughout the State, analysis of the impact of urban stormwater on beneficial water uses, the relationship between air and water quality, and the standardization of technical and administrative urban stormwater runoff control practices.

* In northeastern Illinois, all appropriate municipal and county governments should implement measures to work toward a reduction in BOD in urban stormwater runoff from separately sewered areas.

* Municipalities and counties should adopt and enforce appropriate and adequate stormwater detention ordinances. Such ordinances should be consistent with the minimal standards set forth in the model ordinances developed by either the Northeastern Illinois Planning Commission (Suggested On-Site Stormwater Detention Basin Ordinance, January 1980) or Southwestern Illinois Metropolitan Planning Commission (Model Stormwater Detention Ordinance for Developing Areas, January 1982).

* It is the primary responsibility of the local, state or federal agency to control urban runoff contributions arising from their individually directed activities and facilities. Preferred control practices are administrative procedures for personnel training, improved equipment utilization and scheduling as well as controlled application programs for de-icing or other related right-of-way clearance programs.

* An program of education/information transfer should be initiated. The program would: 1) acquaint developers and local officials with the need for use of proper stormwater management techniques, 2) establish and promote anti-litter activities, and 3) inform homeowners of the proper use and application of fertilizers and pesticides.

Chapter Six -- Mineral Extraction Oil Brine Disposal: The Illinois Water Quality Management Plan identified seepage from brine holding pits, injection operations and abandoned wells as the major sources of brine pollution in Illinois. Oil brine pollution is particularly significant in Central and Southern Illinois. The major impact of brine damage in this area is the contamination and resultant decrease in productivity of the soil. The WQM Plan stresses that strict enforcement of existing regulatory guidelines for the disposal of oil field brines is essential for the protection of currently utilized and potential groundwater sources as well as surface water quality. From a statewide perspective, the control of oil field brine is a necessary component for the

compliance management of groundwater and surface water quality as well as the soil erosion control program.

* The State has primary responsibility through the Gas and Oil Division of the Department of Mines and Minerals (DMMR) for the control of water quality impacts from oil field brine. The control of erosion and reclamation of soil and water resources is a local responsibility.

* Technical guidance is necessary to aid in the selection of Best Management Practices to prevent water quality degradation and restore degrade soil and water resources.

* Local designated management agencies, should continue to inventory and categorize areas of oil field brine damage and should work for brine damage reclamation.

Chapter Seven -- Mineral Extraction/Mining: The Plan summarizes work various agencies on methodologies to assess water quality problems and on assessment of mine reclamation techniques. Studies of GERFDC, SIMAPC and other agencies showed that abandoned coal mining operations, closed before recent reclamation laws, constitute a majority of potentially polluting mine sites.

* Control of pollution from mining activities is necessary to protect waters of the State. Reclamation of abandoned mines and mine waste sites can improve water quality for legitimate uses. Water quality priorities for reclamation should be as follows: (1) public water supply watershed and (2) general use water.

* The maintenance of water quality affected by mining and quarry operations should be assured through interagency cooperation during permit review and the hearing process.

Chapter Eight -- Hydrographic Modification: The Plan defines hydrographic modifications as activities which alter stream channels in such a way that flow patterns are changed. Estimates indicate that one-third or 12,000 miles of the total streams mileage in Illinois has been altered. In Illinois, primary decision-making on hydrographic modification projects rests with the U.S. Army Corps of Engineers and the

Illinois Department of Transportation, Division of Water Resources. From a statewide perspective, the control of pollution resulting from hydrographic modification procedures is a necessary component for the maintenance of legitimate water uses in both urban and rural settings. The primary responsibility for the control of hydrographic modification impacts on water quality rests with the State.

* Illinois EPA, under Section 401 of the Clean Water Act of 1977, will review all applications for hydrographic modifications associated with dredging under Section 404 of the Act. In addition, IDOT, Division of Water Resources and Illinois EPA will jointly review all applications for permits for hydrograhic modification under Section 10 of the federal "Rivers and Harbors Act of 1899" and Sections 65 and 70 of "An Act in Relation to the Regulation of the Rivers, Lakes and Streams of the State of Illinois".

* Districts organized under the Illinois Drainage Code are considered designated management agencies for the control of hydrographic modification impacts. Local public and private interests, including drainage districts, should consider hydrographic modification alternatives that are less likely to cause water quality degradation in lieu of channel deepening and widening projects.

* The modification of permits and operation plans for existing impoundments for the improvement of water quality should be encouraged. Procedures for assuring adequate consideration of water quality impacts for proposed impoundments should be guaranteed.

* The Army Corps of Engineers should cooperate with the State and local jurisdictions in the siting of suitable dredge disposal areas, consistent with the provisions of Section 404(t) of the Clean Water Act of 1977 to maintain federal interest in navigation.

Chapter Nine -- Groundwater: The Illinois WQM Plan summarizes the nature of groundwater problems in Illinois. A large number of Illinois communities depend on groundwater as a water supply. However, numerous sources of contamination threaten this inadequately protected resource. Groundwater protection in Illinois is accomplished predominantly through

remedial action. Although this approach provides a reasonable degree of protection, better management of groundwater is needed. Protection of groundwater quality is a necessary component of an overall water quality management strategy and implementation responsibility is shared between state and local governments.

* The emphasis of the WQM Plan is to ensure the conjunctive management of ground and surface water.

* Areas which have a high potential for groundwater contamination should be identified and protected from pollution. The Illinois State Water Survey, Illinois Geological Survey, Illinois EPA and the U. S. Geological Survey should monitor groundwater in areas of high usage.

* Additional state and/or local control of contamination sources, based on existing authorities, should be actively pursued.

* A groundwater education program needs to be undertaken in order to underscore the importance of protecting underground water resources.

Chapter Ten -- Groundwater/Residual Waste: Residual waste is material (sludge) which is separated from point discharges of industrial, municipal or private waste treatment plants. This waste may contain pathogens, heavy metals, toxic or hazardous material which can cause water pollution. The WQM Plan emphasizes the need for the conservation and reuse of wastes. Needs include the better use of existing sludge management systems and education programs.

* The State, through Illinois Pollution Control Board Rules contained in Chapter 7 (Solid Waste) and Chapter 9 (Special Waste Hauling Regulations) is responsible for the regulations of solid waste disposal practices. In addition, the State is responsible for sludge disposal resulting from the operation of publicly owned treatment works through IPCB rules in Title 35, Subtitle C, Chapter I, Water Pollution.

* The Plan recommends consideration of disposal alternatives through Section 201, landfill compliance with IPCB regulations, proper practices in soil application, continued enforcement of hazardous or toxic standards and permits and education for those who work with sludge.

* The preferred method for disposal of domestic septage, land application, should be encouraged. Specific wastewater treatment plants should be permitted by the IEPA to receive domestic septage. Special consideration is given to conditions during winter when land application is not possible and septage that contains hazardous or toxic wastes.

* The disposal of water treatment plant residues or sludges should be evaluated on a case-by-case basis.

* Responsible local agencies should implement the most cost-effective sludge disposal/utilization schemes consistent with applicable regional and subregional residuals disposal plans.

* The Septage Disposal Plan adopted by NIPC for the six county Chicago metropolitan area is made a part of the Illinois WQM plan for application in its area. Specific recommendations are developed for sludge management in NIPC area communities.

Chapter Eleven -- GroundWater/On-Site Disposal: The Illinois Water Quality Management Plan emphasizes that properly installed on-site systems are of sufficient structural and mechanical integrity to be received as reliable wastewater treatment options. A key area for improving performance of on-site systems is in the procedures for improving quality assurance in terms of design, installation and management of systems. From a statewide perspective, the control of adverse water quality impacts from on-site disposal systems is a necessary component in the conjunctive management of ground and surface water. The responsibility for the proper use and placement of on-site systems is shared between the State and local units of government.

* The State has primary responsibility, through the Illinois Department of Public Health (IDPH) and those counties acting as designated agents of the State, to ensure the effective enforcement of the Private Sewage Disposal Code. In those instances where urban or county health departments act as a local independent authority, they are primarily responsible for enforcement of the appropriate private sewage disposal ordinances or codes.

* It is the primary responsibility of the State to ensure that the administration and application of the IDPH Private Sewage Disposal Code and the IEPA Construction Grant Program be closely coordinated.

* The education/information function should be stressed. This includes both the public and private sectors. All state and local agencies involved with on-site disposal should be kept informed of current developments in on-site disposal technology, and should provide on-going training for their staff. The development of a regular schedule and program of training seminars on septic tank installation and maintenance for licensed contractors and new applicants is encouraged.

Chapter Twelve -- Stream Use/Water Quality Standards: The present Illinois Water Quality Standards have been in effect since 1972. The uses that a given water will support should be directly reflected by the water quality standards assigned to it. The identification of attainable stream uses and supporting water quality criteria are the cornerstornes of the water quality management planning proces. The primary responsibility for the establishment of water quality standards and their revision rests with the Illinois Pollution Control Board.

* The emphasis of the Illinois WQM Plan is to ensure that water quality standards are established and maintained in a manner consistent with the 1970 Environmental Protection Act. This includes the review of existing water quality standard, establishing a process to tailor water quality standards to existing and potential uses of a stream segment and ensuring that public water supplies are protected from degradation.

* The Illinois EPA will work with adjoining states to assure that waters flowing into Illinois meet applicable Illinois water quality standards at those points of entry.

* The designated areawide WQM agencies will assist the Illinois EPA in the process of developing attainable water quality standards for water bodies in those areas.

Chapter Thirteen -- Management: Effective treatment and control of existing sources of pollution and the prevention of future water quality problems are dependent on an effective management system being established to implement the WQM plan. From a statewide perspective, an

effective management system is the key factor in maintaining and implementing the WQM Program.

* The Water Quality Management Plan emphasizes the development of an acceptable and workable Statewide WQM management structure based on the existing state and areawide management systems established in the four Illinois certified and approved WQM Plans.

* This WQM Plan identifies and designates as WQM agencies all entities necessary for the implementation of an effective Statewide WQM program.

Future Implementation Needs

Nonpoint sources contribute significant pollutant loadings to the surface waters of Illinois. Agriculture, particularly row crop agricultural practices, is the single most significant activity to degrade the water resource base of Illinois. Certain other nonpoint sources contribute large quantities of pollutants to the water resource base. In Illinois hydrographic modification, construction erosion, coal mining, and salt water intrusion due to secondary recovery production techniques for petroleum are other significant nonpoint sources. The distribution of problem occurrence also contributes to the complexity of implementing statewide abatement strategies. For example, coal mining activities and petroleum extraction are generally restricted to the southern one-third of the State. On the other had, construction related nonpoint sources are geographically dispersed throughout the State.

Nonpoint source abatement strategies not only face the complexities of geographic problem dispersion, they also must account for site-specific nature of nonpoint source control techniques. This situation is the direct opposite of the point source control programs

which have evolved in the State. These programs rely on a system of process controls, wasteload allocations, permit conditions and a heavy public sector subsidy through the construction grants program. As a result, the management system for point source control can be centralized without a loss of program effectiveness and abatement efficiency. Nonpoint source controls, from a management and implementation standpoint, are currently decentralized. Not only are these control programs decentralized, their primary focus is not necessarily water quality oriented. An example of this management orientation are the cost-sharing programs available to the agricultural community. While much work has been done in Illinois to improve the targeting of cost-sharing resources, these programs still inherently are designed for soil conservation rather than water quality.

In addition, point sources are of primary concern during low flow conditions of surface water systems while nonpoint sources (except for acid drainage from inactive deep mines and baseflow contributions from groundwater sources) are of minimal impact under these conditions. However, nonpoint sources of pollution are most critical in terms of negative impact on water resources during high flow conditions when point sources have little to no impact on water quality. Consequently, these technical and management differences in point and nonpoint source controls are significant and must be accommodated in order for the State to fulfill the mandates of the Clean Water Act. If they cannot be effectively integrated and resolved, nonpoint sources may negate many of the water quality gains achieved by the costly (in terms of capital investment) reductions achieved through point source effluent limitations.

In summary fashion, the following items highlight the implementation needs for nonpoint source control in Illinois:

1. Construction site runoff affects urban areas similar to agricultural erosion. Programs are directed at major growth areas since the control BMPs are preventative. The focus of the program is to assure local authorities deal with the problem. In many cases the local soil and water conservation district has authority and works conjunctively with municipal government. The following activity areas require implementation assistance:

   a) Technical/legal support to adopt and enforce appropriate ordinances
   b) Distribution of standards and specifications procedure to guide local activities in a consistant manner

2. Urban runoff is a problem in major urban areas of Illinois. The control strategy generally encompasses stormwater detention basins or combined sewer overflow treatment. Control options are generally corrective and not preventive. Although erosion may be found in urban areas, control generally is geared toward constituents from urbanization and also respond to spills of chemicals or other material within the urban area. The following activities required initiatives to assure implementation:

   a) Design and construct urban flood retention basins sufficiently sized to also achieve water quality benefits. The incremental increase in design size for water quality is proportionally small.
   b) Work with high priority communities which elected to study alternative controls for combined sewer overflow problems to assure central strategies provide water benefits.
   c) Support effective local storm ordinances development and effective enforcement practices and procedures.
   d) Develop an educational program to inform homeowners of the proper use of fertilizers, pesticides and chemicals as well as proper disposal of containers.

3. Oil field brine has been a problem in many southern counties. The old brine pits require reclamation in addition to brine escape to surface and groundwater, the area is highly vulnerable to erosion. Incentives are necessary to mitigate damages to water supplies and waterways. In extreme cases, deep soil ripping and/or detention structures may be necessary. Since brine storage in pits is no longer permissable, the control is strictly corrective for critical sites.

4. Hydrographic modification is a significant problem affecting over one third of our waters. Channelization, deepening, relocation and changes to waterways not only causes water quality changes but also impairs aquatic habitat and water uses directly.

   Control strategies for both urban and rural streams and lakes can be preventative or corrective. The following BMPs require incentives to implement:

   a. In stream practices to enhance biological use including drop structures, jetty construction, and bed material placement.
   b. Shoreline/riparian corridor practices including tree/grass planting, bank stabilization, and livestock fencing.

5. Agriculturally related soil erosion control has been identified as the highest priority non-point water quality problem in Illinois. As has been alluded to in previous sections of this discussion, the Illinois EPA has been successful to a degree in working with agriculture organizations in abating soil erosion. However, without further incentives and program flexibility these programs will have reached the limit of their usefulness in combating this problem. Although traditional agricultural programs such as those sponsored by the Soil Conservation Service (SCS) and the Agricultural Stabilization and Conservation Service (ASCS) have been modified to a degree in order to accomodate water quality concerns, they are still inherently directed toward the issues of soil productivity and soil stewardship. In order to develop an agricultural nonpoint source control program which addresses the problem of soil erosion and sedimentation as a water quality issue, new initiatives could be effectively utilized:

   1. Provisions for funding BMP's in areas exclusively for the purposes of water quality enhancement and restoration;

   2. Targeting additional funding for the application of BMP's in lake watersheds.

   3. Funding of point and non-point source controls in watersheds conjunctively to maximize water quality benefits for the least amount of capital expenditures.

Mr. ROE. Please proceed.

TESTIMONY OF ROGER A. KANERVA, MANAGER, ENVIRONMENTAL PROGRAMS, ILLINOIS DEPARTMENT OF ENVIRONMENTAL PROTECTION AGENCY

Mr. ROE. Let me interject if I may.

Your statement is very comprehensive and we have included your full statement in the record. I, too, have looked at your statement.

Would you like to defer to Mr. Kanerva, Mrs. Martin, and let him make a short oral statement and then we will receive questions.

Mrs. MARTIN. I am so anxious to find the answers I couldn't even wait.

Mr. KANERVA. I do thank you, Mr. Chairman, and members of the subcommittee, for having us here today.

I am testifying on behalf of the Illinois EPA and the State of Illinois.

I view this round of reauthorization of the act to be as important as the original 1972 initiative. The program is truly at a major crossroads. That is both the institutional and technical framework of the program need careful examination.

What must not be overlooked in this analysis are the significant changes that the past decade has brought which in turn call for rethinking of the strategy we can use in the 1980's. In my written testimony I have given you a summary of these changes and how we think they are applicable.

With these thoughts in mind, I would like to emphasize these points for this testimony. Adequate concern for good government has gotten lost in the fracas these past 10 years. As a State program manager, I can assertively report to you that along with the good things I accomplish in this program I also do a lot of dumb things as part of my role in the clean water program.

I say this in partial reply to certain parties that choose to conveniently sidestep this issue of good government with simplistic political slogans about clean water versus dirty water people.

The rest of my comments will quickly address a number of major issues pending during this reorganization with a view toward demonstrating that good government is not synonymous with dirty water.

Issue 1: Life after BAT. Sounds serious and it is. There is no question that adequate toxics control is a problem which deserves further attention of the clean water program. However, I remain convinced that the considerable shortcomings of the singular pursuit of the priority pollutant codified in the NRDC consent in 1976 and the Clean Water Act of 1977 is not the way to go.

Good government calls for a more targeted effort on toxicity problems at specific facilities. I have been very encouraged by a couple of recent events along this line. Last week I had a chance to take part in the EPA workshop at Airlie House, and the whole thing was about when to do what testing and they are headed in a positive direction in that whole effort.

20-955 O—84——64

Recommendation—Congress should insure that U.S. EPA and the States have sufficient direction and flexibility to pursue a balanced attack on the toxics problem using appropriate mixtures of chemical specific techniques and toxicity assessment to address both human health and aquatic life concerns.

Issue 2: The pretreatment opportunity. The real issue is good government, in my book. If some locally based programs are already achieving the intended results—by that I mean protecting the treatment facilities, not causing receiving water problems and taking care of the sludge adequately—then why in these trying economic times should we abandon successful local programs for a more expensive, less workable Federal program?

Recommendation—the national pretreatment control program should provide for alternative local-based programs under certain conditions. We set forth four detailed specifications in the written testimony.

Issue 3: the challenge of nonpoint sources. I support a renewed national emphasis on the need for nonpoint source control. I welcome reasonable and fiscal responsible enhancements of the nonpoint source program.

Recommendation: We need to constructively build upon the base provided by certified and approved water quality management plans developed by the States and more forward in a phased fashion using voluntary approaches and incentives as funding, so as not to exceed our capacity to adequately define the rules of the road.

Issue 4: our progress in construction grants. The grants program is still in the regulatory throws of sorting out major reforms enacted in 1981. I had the chance 2 years ago to testify before your subcommittee, Mr. Chairman, which was a real opportunity and I again want to thank you all for a super job in sorting through those reforms. It was a real battle and what we got is at least workable.

I do want to make the point with you today that there are some transition delays in getting all that worked out. The regulatory stuff is still being worked on so we are in a general sense behind with obligation targets but there is no problem in terms of catching up. I want to make sure that that does not reflect negatively on the 205(g) delegation process.

In terms of Illinois' situation, we have a backlog of over $200 million worth of projects ready to go beyond the money we will receive in the next 2-year period. That is excluding major things in Chicago. So there is plenty left to do.

Recommendation: Congress should continue to support the authorization and appropriation of Federal construction grants assistance.

Issue 5: this is the very "noncontroversial" water quality standards debate. U.S. EPA clearly created a firestorm with their proposed reform regulations last fall. No problem getting interest in that one. U.S. EPA has now regrouped and backtracked to what I think is a supportable stance. Concern for good government calls for exercising judicious restraint in not reacting in kind legislatively to the regulatory miscues of last year.

Recommendation: Congress should maintain the current provisions of section 303 of the act relating to water quality standards.

Issue 6 and the last one: general program operations. Given current levels of Federal funding support we have been able to maintain a stable program in Illinois. I remain optimistic about eventually realizing the potential for effective operation of the Federal-State partnership under the act. Once again persistence pays.

The 205(g) delegation for construction grants has worked well.

I know this committee was instrumental in some of those initiatives but I cannot say the same for the NPDES program unfortunately.

Recommendation: Congress and U.S. EPA should implement positive reforms that will further streamline the program operations for NPDES.

I respectfully suggest that there is now a place for good government and a reasonable measure of trust. Yes, a real wild word like "trust," among principal movers of the national clean water program. We on the front lines need responsible reforms at the national level if another round of self-fulfilling prophesies of inadequacies of public administration is to be prevented.

Thank you very much for including us and I would be pleased to answer questions or supplement the record with more information if you desire.

Mr. ROE. Thank you for your summary, and I defer to Congresswoman Martin.

Mrs. MARTIN. Thank you, Mr. Chairman.

We were wise to listen, since I think you have at least covered briefly my first question. That is, pretreatment by local government units, using local government units, if they are in place. Would you comment to a greater degree, should there be, in fact, must there be that alternative within any legislation?

Mr. KANERVA. We feel strongly that there be—should be. To put it as strongly as I can in Illinois, we have 3,000-some industries felt to be subject to pretreatment in 754 publicly owned treatment works in the State. That 3,000 industries is 20 percent greater than the entire direct discharge program that I run as a State manager now. That covers some 2,500 discharge permits. So it is a big issue with us.

It brings us to this committee wanting to make the points about the need for running the pretreatment program effectively. It is not like we have just a few folks we have to deal with out there.

We have gotten well along the way toward evaluating the local entities and can share with you thoughts about just how the legislation ought to approach that issue.

Mrs. MARTIN. Staying within that same subject area, what costs and benefits do you see for federally designated pretreatment on those treatment plants that are publicly owned? I get—after your reply—Mr. Chairman, I would like to put into the record specific reasons for that question.

Mr. KANERVA. We have been studying intensively the 41 POTW's we have that are greater than 5 MGD flow. Our reason for that is that that subportion of our public treatment works are mandated to have programs under the Federal regulations.

Now, of those 41, 25 of them that we have studied receive no additional benefit at all from implementing the Federal pretreatment program. They already have local limits they enforce, the plant is

OK, the receiving water is OK, and the sludge is managed OK according to our permit requirements and all.

Now, 13 of the 41 stand to gain at least a little benefit and only one really absolutely would make major strides ahead. In other words, they have not done well at all with pretreatment.

That results, when you consider the number of industries in those differing categories—the 25, 13 and 1—that results in 86 percent of our industries now today receiving adequate pretreatment control. That is without the Federal program.

Mrs. MARTIN. The reason for this specific question, Mr. Chairman, it is something that doesn't happen usually on the local basis. In my largest city, a referendum actually passed for sewage treatment, a massive system, done looking ahead, looking ahead to the fact that industry was important, industry united with environmental groups, with community groups, and passed by an incredible percentage this mostly locally funded and federally helped entire sanitary facility.

I happen to have had the highest unemployment in the United States, 22 percent. Were this legislation to go into effect and achieve the goals it envisions, this would cost the same industries today that now pay a pro rata share—who imposed that cost on themselves and fought for this—impose an additional $15 million with no benefit to the environment, no benefit to the industry, and surely no benefit to the workers because some of those businesses, of course, are in very fragile economic-circumstances.

So that I would hope that one of the things from Mr. Kanerva's testimony comes the point clearly that if the legislation describes a goal and allows flexibility in how to achieve it, that we don't lose sight of the goal, that we don't allow backsliding, that we don't allow the excuse of time or even the economy. But if that goal is being achieved, we must assure all concerned that we do not additionally impose costs that would have no benefit for any purpose whatever except the rule.

Lastly, I would appreciate it if you would look at tables 1 and 2 in your testimony. One of the purposes for me on public works, frankly, was to watch out for Illinois, both Republicans and Democrats. I wonder if you could say again that for a majority of Illinois areas that are already reaching the goals what legislation without the flexibility of allowing that to count would mean, including my own home city of Rockford?

Mr. KANERVA. Again, this table 1 is the detailed layout of those figures I summarized before. This table has 41 POTWs on it. As I said, the last column refers to the assessment of whether there would be any benefit at all, a little or a major benefit to communities in Illinois to understanding the additional cost and problems of the Federal program.

As I say, 25 of the POTWs receive no benefit; 13 receive very limited benefit; 1 receives a major benefit. Again, that represents 86 percent of the industries that are listed on these columns already being under effective control without the need for this additional work.

One thing I didn't—two things I didn't mention were that you brought up the point about the expense to industry, which is excellent in the one situation. We have talked to some of the POTW's

on this list in the 41, we don't show costs, but in the written text we indicate it would range as high as $1 million a year additional expense, operating expense, to add the Federal pretreatment program on top of what they are doing, and they won't get any benefit in terms of what the plant will see, the plant will see or sludge disposal will see.

At the State, in the worst case, the State expenses may nearly double.

Now, there are not State dollars and I don't think there are additional Federal dollars to pay another $1.5 million which we are already paying for the direct discharger program. So I am stuck in a situation where from the State level if these facilities were to be implemented, my costs to participate might double, the resources are not there, so I either do less enforcement of the direct dischargers, which means that imposition of the Federal program becomes a dirty water program, I don't do as well with direct dischargers and I would lose ground. So I get set back.

Or, alternatively, I limp into the pretreatment program and wind up with a dog-faced version to play along, but it doesn't get me anywhere.

Mrs. MARTIN. I would have to add selfishly that of the cities that receive no benefit that have those pretreatment plants, however, all the cities in my district receive no benefit, just costs. So obviously my bias is clear. It is a bias toward flexibility of achieving the goal; in no way do I suggest nor do I think—nor is Roger suggesting changing the goal.

I would hope under your leadership, Mr. Chairman, that that flexibility could be built into the legislation that will come from this committee.

Thank you.

Mr. ROE. I thank the gentlelady from Illinois. The gentleman from Missouri.

Mr. YOUNG. No questions, Mr. Chairman.

Mr. ROE. The gentleman from Oregon?

The gentleman from Oregon passes.

Mr. DONNELLY. The gentleman from Massachusetts passes.

Mr. ROE. I think your testimony is excellent. Let me tell you what I like about it; it is technical but it is realistic. You centered on the important issues when you spoke to good government aspects and then to make rules and regulations where rules and regulations alone will not solve this.

Let me ask you, what is your backlog in needs now for you in Illinois?

Mr. KANERVA. What I gave you was the backlog of ready projects over the next 2 years we know funding is coming in on. That at least is at the $200 million level. Our total backlog is several billion.

Mr. ROE. Several billion.

I wonder if what may be happening; try this on for size, there is no sense in spending a ton of money to do more plans and specs if you know that on the projects you will only get so much money, so you are concentrating on the areas that will be productive. If you got $2 billion in backlog—we have better than that in New

Jersey—there is no use in doing plans and specs because there will be 10 years past before you get the money.

Mr. KANERVA. We have slowed up very much in pushing people to start. We are concentrating on what we have on the boards.

Mr. ROE. That is the point. As far as New Jersey, Illinois, Pennsylvania, Oregon, whatever, Massachusetts, there is no sense of our throwing good money out there if we are going to be 10 years down the line before we get funded because of the way $2.4 billion is divided. It would seem logical if we really wanted to take the steps we wanted to do above and beyond programmatic changes and more local determination, the investment of funds are necessary. Somebody has to invest.

Mr. KANERVA. Yes, sir.

Mr. ROE. From a priority point of view, what does the Congress want to do in its priorities with all the budget constraints we have? Do we spend the money here or don't we? Does it also seem reasonable that whether it is $2.4 billion three or 1.9, I don't think anyone has assessed where we go with the limited funding without slipping backwards.

Mr. KANERVA. I am not sure I understand.

Mr. ROE. Our pollution problems will be with us until the day we die because we got changes taking place all over the Nation. We have growth here and there, and different things, so it is an ongoing thing. But the purpose of the act was to get to a point somewhere at a time certain where we would have the handle on it and as we grew. We could move ahead and refine technology and build to fit it.

From all the testimony we have had over the last 6 or 8 months on this program, that the $2.4 billion is inadequate for us to begin to meet our goals. And beyond that, if you add additional heavy programmatic responsibilities and beefing up your staff needed in the pretreatment aspect, you have to put another 300 people on, who will pay for it?

If you have to cannibalize existing staff, people have more to do and they just physically can't do it. Is that a reasonable point to make?

Mr. KANERVA. That is right.

Mr. ROE. So, what we are saying is without a reasonable level of adequate funding, instead of the program ahead, the program will remain static or it will fall behind. Isn't that a reasonable point to make?

Mr. KANERVA. I see your point. Yes, it is, and one of the key points in the beginning of the act was to get everyone up to a minimum level——

Mr. ROE. With a date certain to do it in?

Mr. KANERVA. And from there on they carry their own cleanup efforts locally. And we are just slipping and slipping.

Mr. ROE. Therefore, when we talk about reauthorizing the bill, we are reauthorizing, granted there will be changes made that are necessary, but that is not the solution to the problem. The solution is to what level investment do we want to make in the program? Is that reasonable to say?

Mr. KANERVA. That decision has to be come to grips with if the rest of it will mean anything.

Mr. ROE. OK. If there are no other questions, we want to thank you for your splendid substantive testimony. We appreciate your appearance today. We are going to be looking into your suggestions.

Next we have Mr. Jack Stein, manager of environmental engineering planning, Anheuser-Busch, from the St. Louis Regional Commerce & Growth Association.

TESTIMONY OF JACK STEIN, MANAGER, ENVIRONMENTAL ENGINEERING PLANNING, ANHEUSER-BUSCH, INC., REPRESENTING ST. LOUIS REGIONAL COMMERCE & GROWTH ASSOCIATION

Mr. STEIN. Thank you, Mr. Chairman.

Mr. ROE. We want to welcome you to our committee.

First of all, the distinguished gentleman from Missouri, Mr. Young, will offer a formal welcome.

Mr. YOUNG. Mr. Chairman, I appreciate the opportunity to welcome Mr. Stein. When you see the Anheuser-Busch label there, it does whet everybody's appetite to some degree. We are pleased that you are here, Jack.

You heard some questions coming from Mr. Donnelly and others who recognize the corporation with the eagle and all. We are not doing so well in the standings in the National League, but I want to welcome you here and to follow the Representative from Illinois, the St. Louis Regional Commerce & Growth Association affects both parts of the metropolitan St. Louis area.

So I want to welcome you to the committee, and I look forward to your testimony.

Thank you, Mr. Chairman.

Mr. ROE. The gentleman will proceed.

Mr. STEIN. The St. Louis Regional Commerce and Growth Association appreciates the opportunity to appear once again before this subcommittee to express our views on amendments to the Clean Water Act. RCGA members number over 3,000 and represent business, industry, labor, institutions, and organizations on both sides of the Mississippi River at St. Louis working for economic development in the bi-State region.

RCGA recognizes the improvements in our national water quality which have been brought about by the Clean Water Act. We believe that clean water and economic development are both important and need not be in conflict. We are also concerned about Federal programs which do not measurably move us toward our national environmental goals but which do saddle our local economies with major financial burdens.

I will confine my remarks on behalf of RCGA today to three areas: Mandatory secondary treatment; pretreatment for the control of toxic pollutants; and risk assessment as a technique for directing our national clean water program.

Let me first address mandatory secondary treatment. The requirements of section 201 were written before the staggering capital costs of uniform secondary treatment were realized and before the impacts of the energy shocks of the 1970's on operating costs could be foreseen. Congress has recognized since Public Law 92-500 was passed that in certain instances mandatory secondary treat-

ment is not needed—in the case of ocean discharges—just as it realized in 1972 that some sensitive water bodies merited more protection than secondary treatment alone provided. We request the Congress to examine the need for secondary treatment in selected inland locations as it continues to "fine tune" the Clean Water Act.

The flow of the Mississippi River through the St. Louis region, although seasonally variable, is very great. The average discharge during calendar year 1982 was 278,700 cubic feet per second—180 billion gallons per day—enough water to support a community of 1.2 billion people.

The BOD and suspended solids content of the river is also highly variable, reflecting the predominant influence of rural, nonpoint sources of these pollutants on the river. Under average conditions, upstream sources contribute 24 pounds of BOD for every pound discharged from our largest treatment facility. The proportion of suspended solids is even more lopsided.

These findings are consistent with a 1978 GAO study which showed "that planned expenditures of Federal funds for secondary treatment works in the St. Louis, Missouri area will only minimally improve the quality of water in the Mississippi River."

The GAO report also concludes that:

> Because available Federal funding for municipal wastewater treatment projects falls far short of national needs, we believe available funds should be directed to those projects where improvements to water quality can be optimized. The national requirement to provide secondary treatment may be too rigid, and Environmental Protection Agency regulations may preclude the earliest financing of pollution control projects which have greater potential for improving water quality.

The current cost estimate—1983—for adding secondary treatment at the Bissell Point sewage treatment plant operated by the Metropolitan St. Louis Sewer District is in excess of $300 million. This cost equates to a capital expenditure of $672 to remove each pound of BOD generated daily.

Since the activated sludge process requires high energy consumption, $15 million will be needed every year for electricity alone, with an additional $10 million annually for other operational costs. The expected impact of these added capital and operating costs will be a threefold increase in current residential user charges. This cost increase will pay for the removal of less than 4 percent of the BOD loading in the Mississippi at St. Louis.

Current estimates of annual power consumption for operation of the secondary treatment process at the Bissell Point sewage treatment plant are approximately 136 million kilowatt-hours. This equates to the annual power consumption of over four typical major hospital complexes.

The GAO report quoted earlier in this testimony suggests that mandatory addition of secondary treatment in certain cases may prevent funding of other projects which would have a more direct and immediate effect on water quality projects.

In St. Louis, at or above river stage 20, approximately 60 percent or greater of the dry weather sewage flow cannot reach the existing treatment plant. River water inflow control gates by design must be closed to prevent backwater flooding of the treatment system.

The river is above stage 20 more than 20 percent of the time during average rainfall years and more than 50 percent of the time during high rainfall years.

Current 1983 estimates for construction of a computerized, hydraulically operated gate system for 28 flood wall pump stations to correct this situation is $62 million. We see no logic in increasing the treatment level of a system which is incapable of receiving a large proportion of wastewater generated by the community.

It is recognized that secondary treatment has a varying capacity for removal of toxic organics and heavy metals. The percentage removal varies among treatment plants. Utilizing a large secondary treatment system as a safeguard against the discharge of toxic pollutants into receiving waters does not seem justified.

Economies of scale are only applicable to the removal of pollutants for which a system is designed, i.e., compatible pollutants for POTW secondary systems.

It is more effective and certainly more efficient consideration interaction of toxics with other wastewaters to remove toxics at the source and thereby prevent their entry into the sewer system.

This concept was thoroughly recognized by Congress in Public Law 92-500 and in its 1977 amendments, Public Law 95-217. The pretreatment of toxics by the generating source prior to discharge is the logical methodology to utilize for protecting the sewer system and treatment processes from damage preventing the pass-through of such substances into receiving waters or the contamination of treatment plant residues.

At this point, I would like to amplify RCGA's views with respect to the Federal pretreatment program.

The existing programs being administered under the Clean Water Act for control of conventional and toxic pollutants are based upon national technology based standards and mandatory secondary treatment.

While RCGA supports the basic objective of the program, RCGA feels that the implementation lacks flexibility and is not cost-effective in terms of water quality improvement versus resources expended for sometimes unmeasurable water quality benefits.

To achieve the goals under the Clean Water Act in an efficient manner, RCGA believes that regulatory flexibility must be available to responsible publicly owned treatment works in the form of, one, performance equivalency as compared to mandatory secondary treatment; and, two, pretreatment equivalency as compared to the current national pretreatment program.

As noted earlier, RCGA believes that mandatory secondary treatment, as a uniform national requirement, is not justified in terms of both water quality improvement and the cost of compliance.

We are especially concerned about the current EPA endorsement of secondary treatment as an overall solution to toxic pollutant control. While some data are available which demonstrate that some removal of toxic pollutants does occur in secondary treatment systems, this could not and should not be extrapolated to all the thousands of POTW's across the United States.

We believe that the record should be set straight on this issue:

Secondary treatment or an equivalent POTW specific performance standard does not guarantee a defined level of toxic pollutant control.

Toxic pollutant removals will always vary from POTW to POTW due to the wide number of variables which exist within such complex systems.

Cost-effective control and removal of toxic pollutants is best handled at the source of generation by cooperation between the POTW and its industrial users.

The existing pretreatment program, with its implementation based on national categorical standards, severely limits the ability of POTW's to provide cost-effective treatment to the entire community for the removal of toxic pollutants.

RCGA is concerned with the adverse impact the current national pretreatment strategy will have on the economic viability of many manufacturing establishments which are the life blood of our community.

We are concerned also about the obvious technical deficiencies and inequalities of the current program. Aside from these concerns, the current program and regulations will involve POTW's in one of the most horrendous paper processing activities since the conception of the Clean Water Act.

Our local pollution control agencies will need to significantly increase their pollution control budgets to meet the numerous record-keeping and data processing requirements of the regulations without any direct measurable benefit to water quality.

RCGA supports an alternative approach which will take into consideration local agency capabilities to develop equitable solutions to local water quality needs. If a POTW can demonstrate that it can develop and implement a program which will meet national pretreatment objectives and maintain receiving water quality, it should be given the opportunity and responsibility to do so.

We envision a pretreatment program operating at the local level which would contain major operational elements as follows:

The local agency should have the discretion to implement the pretreatment program on a pollutant by pollutant basis based upon the type of toxic pollutant discharged for treatment, concern for system protection, identified water quality goals, and residuals quality acceptance.

A pretreatment program should enable a POTW to develop specific discharge limitations which could then be applied equitably throughout its system of sewers and treatment plants.

Any technical or pretreatment equivalency program should only be made available to the local agencies that can demonstrate they have the technical, financial, and legal resources necessary to support effective operation of such a program.

Implementation of a pretreatment program can best be handled through modification and reissuance of the POTW-NPDES permit with the same checks and balances which exist currently under the national pollutant discharge elimination system.

The end-of-pipe monitoring concept must apply not only to the POTW but to the industries discharging to the POTW treatment system to determine compliance with established effluent and discharge limitations.

Any pretreatment program should enable the authorization of a single effluent limitation for a specific pollutant, for a specific period of time, such as 3 years, or for the duration of the POTW-NPDES permit.

Any developed local pretreatment program should not require dischargers of conventional pollutants to remove such pollutants as a substitute for municipal treatment adequate to meet the requirements of the POTW-NPDES permit.

At this point, I would like to speak to the topic of risk assessment. RCGA is gratified with the increased attention this concept is receiving in the regulatory community. We believe that sound scientific and technical bases should underlie our national environmental protection programs.

We cannot continue to ignore the economic consequences of goals such as "zero discharge," particularly when ever-smaller environmental and health risks can be defined. Sound science and sound engineering should be used as the tools for determining the risks and benefits of such programs as uniform national secondary treatment.

With such information in hand, informed decisions may be made by EPA, with appropriate public participation, such that the twin goals of a safe and healthy environment and the wise use of our limited economic and other resources may be realized.

Thank you.

Mr. ROE. We want to thank you, Mr. Stein, for your substantive testimony, and also for many of the ideas you have presented. I think they have a lot of merit. Are there any specific questions?

The gentleman from Missouri.

Mr. YOUNG. Thank you, Mr. Chairman. Jack, we hear a lot about the decay in infrastructure of our cities. What will the increased cost of secondary treatment do to our cities' abilities to raise local funds to replace their old and failing sewer systems?

Mr. STEIN. I think, as you know, Congressman, on the Missouri side, MSD has had some tremendous problems with sewers that go back into the 19th century. If we increase residential charges for secondary treatment by a factor of three, it is going to be very difficult to obtain local funds through bond issues or other means, to take care of the collection systems, and of course, without the collection systems, the treatment plants can't do their job.

Mr. YOUNG. Mr. Stein, do you think our Federal funds earmarked for secondary treatment plants would be better spent then on infrastructure replacement?

Mr. STEIN. I think that is the way we feel, Congressman. I think the voters have been very supportive of the clean water program over the years, but I think they also demand value for the moneys expended, and certainly it is difficult to make a case for imperceptible changes in streams such as the Mississippi River, and we can't continue with our decaying sewer systems and maintain them in the way that they should.

Mr. YOUNG. Thank you very much.

I have no further questions, Mr. Chairman. Thank you very much.

Mr. ROE. The gentleman from Oregon.

Mr. SMITH. No questions.

Mr. ROE. Mr. Stein, one point I think that you are coming down on above and beyond all of the other important matters you presented, would be based upon the thesis that with $2.4 billion allocated, at least at the perceptible future, those funds are inadequate. We have asked other witnesses to be able to meet the ongoing needs that the States and their political subdivisions have at this point, and maybe if it is determined that that is the maximum, which I think is a national tragedy of the Federal investment, that is to be made over the foreseeable years. Because of budget deficits or whatever the reasons, priorities, that maybe there ought to be a very serious look on a State-by-State basis and come back and say the following:

That it is not good enough to set up, have the States allowed the prerogative of setting up their own, through public hearing, their own priority system. Unless they direct their attention to the needs in their priority system to be able to achieve the first goals first, the most important ones is the substance of your discussion.

It is a partial political problem, as I am sure you are aware. You have got 145 politicians. They are trying to follow what the Congress directed them to do. You have got to have no discharges at a given point, you have got to have secondary treatment. How come your city isn't ready and how come your city is ready and the whole bit? But you are coming back and saying that might be politically ideal to be able to do it that way, but that is not solving the pollution problem?

If a particular city or a particular region of a State need extra funding at a given point to be able to clear up more of the pollution, should they not be given a separate priority because of that situation?

I think that is basically what you are saying.

Mr. STEIN. That is correct.

Mr. ROE. So just mandating certain mechanical things is not going to necessarily clear up the pollution, unless you have the funds to do it with.

Mr. STEIN. I would say that certain mandatory standards made sense 10 or 15 years ago when a large number of our communities had no treatment at all, and certainly they have made tremendous strides, in no small part due to the construction grant program under Public Law 92-500, Public Law 660 and others.

I think, as we get further along in this program, we have got to take a closer look at the benefits that are actually received and adjust our priorities accordingly.

Mr. ROE. But basically everybody that has testified in the last series of hearings we have had, have come back to the underlying point—that you can't achieve the goals unless you are willing to make the commitment.

Mr. STEIN. That is correct.

Mr. ROE. That is basically what it is about, and who is going to pay the bill, isn't that really what it is about?

Mr. STEIN. That is correct.

Mr. ROE. I have no more questions.

Any further questions?

If not, we want to thank you very much for your patience and your indulgence. Your testimony is excellent. We appreciate your taking the time to be with us today.

Mr. STEIN. Thank you very much, we appreciate it.

Mr. ROE. Our last distinguished witness for the day is Mr. Michael Dimino, who represents the Authorities Association of New Jersey. Therefore, I am particularly interested at this juncture and to what you have to say.

I want to welcome you to our committee. I appreciate your patience in waiting. If you would proceed.

TESTIMONY OF MICHAEL A. DIMINO, PRESIDENT, AUTHORITIES ASSOCIATION OF NEW JERSEY

Mr. DIMINO. Thank you, Mr. Chairman, and members of the committee. I have been sitting here since 10 o'clock this morning hearing all these buzzers and whistles going on and off and I was hoping that prematurely someone would not end the session.

I am appreciative of that.

By way of background, the Authorities Association of New Jersey is an association of over 200 water supply and sewerage agencies and professionals from throughout New Jersey whose chief objective is to promote the general welfare of its members through communication among the regulatory agencies, other related trade groups such as the Utility Contractors Association and, of course, all of our members.

In short, we are concerned about the management of the environment by the most cost-effective and equitable means possible. It is this latter concern that brings us to comment about Congressman Howard's proposal to reauthorize the Clean Water Act through 1988.

First and foremost, the association applauds Mr. Howard's efforts. AANJ has gone on record in the past and continues to assert that the grants program is the most equitable and affordable means for all U.S. citizens to share the cost of environmental protection.

To place the financial burden solely upon the users of sewage treatment works is inequitable since this ignores the benefits gained by everyone in this country from the clean waters produced by the expensive operation of sewage treatment sytsems.

In this regard, it is only appropriate to state that the proposed level of funding that Mr. Howard is proposing, meets with AANJ's complete approval. However, the funding percentage should be flexible and be allowed to go as high as 75 percent. It should be up to the Governor to approve lesser amounts, but not less than 55 percent.

On other particular points of Mr. Howard's proposal: One, we agree that EPA should be required to publish a list of waters designated for fishable/swimmable in connection with the implementation of best available technology. EPA's certification that the failure to meet standards is due entirely or substantially to discharge of toxics from a point source is also acceptable.

Two, we agree with the limitations of waivers under section 301(h). The association would add, however, that if such exceptions

for waiver are met by a POTW, the EPA be given a time limitation to approve the 301(h) waiver requests.

Three, we agree that States should be required to adopt numerical criteria for toxic pollutants when revising water quality standards. The numerical criteria should be technically supported, however, and should serve to guide realistic pretreatment removal limitations.

That is the formal feeling of our association. I would like to add a couple of personal views on the term of "affordability."

I would like to give you some real facts on a project in New Jersey, which has already been implemented with the grace of God.

My employer is a regional sewerage utility that services the Princeton area of New Jersey, and we were fortunate enough to have received a 75-percent grant in 1976. The point of this example is that in 1976 we had a 75 percent Federal grants program, and in New Jersey we had an 8 percent matching grants program, as you know, Mr. Chairman.

We were also fortunate enough to fund our local 17 percent share with 5.9 percent financing, and with all of that, between 1976 and January of 1983, construction costs have gone up about 65 percent, according to the Engineering News record building cost ratios.

The point of all this is with all of that in mind, and relatively cheap costs compared to today, we are passing approximately $150 a year to each home owner in the Princeton area of New Jersey.

If that same project, which incidentally costs about $55 million, were built today, under today's scenario of 65 percent funding in New Jersey, or as the existing law will go out into 1985, going to 55 percent, those rates would at least triple.

So what I am saying is that we need an affordable means of achieving our goals, and yes, we wholeheartedly support that grants program as the way to do it.

I will add that I heard remarks this morning from Wayne Bryant, assemblyman representing Camden, and Camden County is one of the members of our association, and we are very sympathetic to their plight.

I will be very grateful to either send you more information or answer any questions.

One more point I would like to make that I haven't heard come up today is that when we build these plants, yes, we are achieving environmental benefits, but I think one thing that we have to not lose sight of is that we are providing a big stimulus to the economy, and I am sure the Utility Contractors Association can certify that they certainly employ many people to build these plants, and that after these plants are built, they are not operated by "donkeys and alligators."

They are operated by human beings that work and derive a good living from operating the plants. In New Jersey, we have thousands of people employed, maybe close to 10,000 throughout the State in our industry, and these are jobs that continue, and if they are law-abiding citizens, they contribute to the tax system that supports this country. I do want to make that point.

Mr. ROE. Very good. We appreciate your testimony.

I think you have summed up and brought into focus the areas of our own deepest concern, because it boils down to the point of view that if we don't have adequate funding to be able to do the job that has to be done, it is not going to be done, No. 1.

No. 2, if we attempt to impose an enormous burden back upon those people that are coming down the line now, it really wasn't any fault of their own that they were delayed, it might have been complex engineering involved. They weren't on the priority list, now they have to pay four times as much as for any other system.

I think that is the point you made.

Mr. DIMINO. Yes, sir.

Mr. ROE. Thank you for being here today. We appreciate your thought processes and appreciate your help.

Mr. DIMINO. Thank you.

Mr. ROE. Ladies and gentlemen of the committee, we have concluded today's session. We will recess until the call of the Chair. We are now, for the benefit of the members, working out the advance schedule. We have still quite a number of witnesses to hear, so we will be working together on both sides of the aisle to establish the next phase of our hearing process.

In the meantime, the subcommittee will recess.

[Whereupon, at 3:15 p.m., the subcommittee recessed subject to the call the Chair.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, OCTOBER 18, 1983.

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2247, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

The Subcommittee on Water Resources will continue its hearings on the Clean Water Act. We have been having a great number of these hearings, as you know, and we have more to go. We are getting a wide review from throughout the Nation on the many, many issues that are involved.

I see that Mr. Hammerschmidt is here. Do you have an opening statement?

Mr. HAMMERSCHMIDT. No, Mr. Chairman.

Mr. ROE. Well, we do have with us our very distinguished colleague from Maryland, Hon. Roy Dyson as our first witness this morning.

Mr. Dyson, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF CONGRESSMAN ROY DYSON

Mr. Chairman and distinguished members of the Subcommittee, I want to thank you for inviting me to testify a second time before you on H.R. 2817, legislation I introduced earlier this year that would amend the Clean Water Act to provide for the enhanced water quality of the Chesapeake Bay.

In my previous testimony of August 2nd, I indicated that the Bay is the major economic and environmental resource of my home State of Maryland and is of extreme importance to all states in the Chesapeake Bay region. It provides thousands of people with jobs in the fishing and outdoor recreation industries, particularly constituents of mine in Maryland's First Congressional District. It is a thoroughfare for nearly $240 million in maritime commerce annually. And it is home to countless forms of marine and aquatic life.

My purpose in speaking to you today is to bring you up to date on significant events in the ongoing effort to improve the quality of the Bay.

First, at the end of September, the Environmental Protection Agency released its official findings from the Chesapeake Bay Study. This seven-year, $27 million effort answered some of the most pressing questions about the conditions of the Bay. These results, however, only indicate how much work remains to be accomplished.

I take some satisfaction in the completion of this project since I secured the funding to finish this analysis in the final days of the 97th Congress.

20-955 O—84——65

The EPA's report clearly indicates that the Bay is an ecosystem in decline. It suggests that actions throughout the Bay's 64,000-mile watershed can affect the water quality of the rivers flowing into the Bay. Degradation of the Bay's water and sediment quality can, in turn, affect the living resources in it.

Thus, effective management of the Chesapeake Bay must be based on an understanding and an ability to control both point and non-point sources of pollution throughout the Chesapeake Bay basin. It is clear that to achieve this there is a need for the Federal government and the states to work together closely to develop specific management plans that address the regional problems identified by the EPA.

Mr. Chairman, it is clear that the final report of the EPA's Chesapeake Bay Study points to the need for a solution that I hope will begin with the inclusion of my Bay legislation in the re-authorization of the Clean Water Act. It provides the necessary federal incentive, $10 million in each of the next four fiscal years, to prompt the states in the Chesapeake Bay Basin to devise a comprehensive and effective management plan. In return, the States must commit themselves to pay an amount equal to 45 percent of the total cost, or roughly $8 million annually over the same time period.

The second event of importance in our efforts to clean-up the Bay since August took place just yesterday in my congressional district, when I hosted some key colleagues of mine from the House of Representatives for a trip on the Bay. These Members represented virtually every area of the country, were both Democrats and Republicans, and all of them demonstrated a keen interest in preserving the Chesapeake Bay.

I took them to my district, which encompasses almost all of the Bay, to give them a first-hand glimpse of the Chesapeake's beauty and the problems it currently faces.

I am pleased to report that the response from this bi-partisan group was enthusiastic for efforts to save the Bay and for my legislation in particular. Tom Bevill of Alabama, Chairman of the Energy and Water Development Appropriations Subcommittee, pledged his total support for the initiative, reinforcing his long-standing concern for the Bay. I was also happy that another of my Southern colleagues, Mr. Hammerschmidt of Arkansas, and a member of this Subcommittee (who is here today), could join me, demonstrating his commitment to saving the nation's largest estuary.

The presence of this group of distinguished legislators, who represent such diverse constituencies, symbolizes the growing national consensus to protect one of our country's greatest natural resources. That same growing consensus is urging passage of H.R. 2817 as a crucial first step in this preservation process. This support compliments the regional support for my Bay legislation. Currently the bill is cosponsored by all members of the Maryland and Virginia Delegations, and over two-thirds of the members from Pennsylvania, three of whom are members of this Subcommittee. In addition, the governors of all three states have publicly endorsed the bill.

Because the Chesapeake Bay is our largest and most productive estuary, the efforts we make to enrich and preserve it can serve as a model for resolving pollution problems in other estuaries in this country. Dr. Joseph Mihersky, the University of Maryland's top expert on the Chesapeake Bay, who accompanied me yesterday, said, "the whole nation is watching how we handle the Chesapeake Bay. Prompt action to enact policies that will preserve this valuable body of water will be seen as the example of how to reach the necessary consensus in resolving estuary pollution."

Mr. Chairman, I believe that Dr. Mihersky's point is well-taken and coincides with the intent and structure of my Bay legislation. It calls for an effective and creative means of federal-state cost-sharing so as to be realistic in an era of restrained government spending. These funds will be used to deal not only with the Bay itself, but with the river basins that contribute the nutrient run-off that has caused much of the estuary's decline.

Yesterday's trip on the Bay was a historical event because it involved such a broad spectrum of Congressmen who are interested in supporting legislation that will clean-up the Bay. Such a development has never happened before with respect to the Chesapeake.

The legislation which I am offering as an amendment to the Clean Water Act has that same unprecedented significance. It is an important first step in restoring and maintaining the Bay's ecological integrity.

I hope that in the future, Mr. Chairman, you and the other members of the Subcommittee will be able to join me for a tour on the Bay so as to acquaint you first-hand with its present beauty and its future needs.

Mrs. James Michener, wife of the author of Chesapeake, commented yesterday on our trip that saving the Bay is an important and unique way by which we can im-

prove the region's quality of life. I believe that the inclusion of my Bay legislation in this year's re-authorization of the Clean Water Act is the needed first step to insure this much-needed improvement for the citizens of the Chesapeake Bay region.

Mr. Chairman and members of the Subcommittee, I urge you to include my bill in the Committee's version of the re-authorization of the Clean Water Act. Then we can be certain that we have made the best step in beginning a new era for the Bay. I again want to thank you for your past cooperation and your future consideration.

Thank you.

Mr. ROE. Please proceed.

TESTIMONY OF HON. ROY DYSON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MARYLAND

Mr. DYSON. Thank you very much, Mr. Chairman, my friends, and colleagues. This is a little different from the last meeting where I appeared before you. Quite a few members heard me then. This is a more intimate gathering.

Mr. ROE. This is a quality gathering.

Mr. DYSON. I recognized that right away, Mr. Chairman. I was just talking to my friend here, and he indicated that with your permission, I would ask unanimous consent to submit a statement. Since we are a smaller group this morning I prefer to sort of speak off the cuff, first of all to tell you how much I appreciate——

Mr. ROE. Let me accept first, your formal statement will be included in the record.

Mr. DYSON. I would like to again thank you not only for this hearing but the hearing you held back in August when you gave me the opportunity to testify on behalf of the Chesapeake Bay bill that I have introduced, H.R. 2817. As you know, I am attempting to amend this legislation to the Clean Water Act.

What it would do is basically provide grants to the three States, Pennsylvania, Maryland, and Virginia, to set up an interstate management coordination team for the Chesapeake Bay region. This would put the cleanup process in motion. As you know, yesterday some members of your subcommittee and some members of the committee I sit on, merchant marine, took a tour of the Chesapeake Bay. We had just had presented to us the $27 million EPA report begun back in 1976 that showed a number of things about the Chesapeake Bay.

First, it indicated it is an estuary in decline and that most of that decline can be attributed to human activity. I think what we are attempting to do is to try to reverse this decline and restore the bay to what it once was. We have a monumental task on our hands. The EPA report addressed issues like sedimentation in the Chesapeake Bay. Of course, that is coming from both agricultural, rural, and urban runoff. Very often we like to point the finger at our farmers and talk about agricultural runoff, particularly fertilizers like nitrogen and phosphorus that are having a devastating effect on the Chesapeake Bay.

That finger can also be pointed to our sewage treatment plants; and they, in their efforts to make the effluent as pure as possible, have been also flushing a tremendous amount of nitrogen and phosphorus into the estuary.

Toxic compounds are a very serious problem for the Chesapeake Bay. We know that there are about 308 toxic chemicals, or what

are called heavy metals, are dumped into the Chesapeake Bay. They come from three major tributaries, the James, Susquehanna, and the Potomac. Neither of those tributaries has its origins in the State of Maryland.

These kinds of issues are very critical to us if we are going to attempt to clean up this estuary. You know, I look with some favor on what congressional concern for the Great Lakes has done to reverse the damaging trends in Lake Erie and the other Great Lakes.

I see what Great Britain has done with the Thames River, which had pollution problems like the Potomac. They have cleaned that up. Rome has attempted to do the same thing in Italy. But the Chesapeake Bay is a unique estuary. It is one of the largest inland bays in the world. If we can clean up the Chesapeake Bay, and the entire Nation is looking toward us in that effort, I believe there isn't any environmental task that we cannot accomplish. Restoring the bay is what we need to do.

Now, I say we because it is a task that is far too big for the State of Maryland. It is too much for the State of Pennsylvania. It is too much for the State of Virginia. In this whole vast region of about 64,000 square miles where all the major tributaries are that enter the bay we need to develop a comprehensive approach to the Chesapeake Bay. And I think we can do it.

As I told you in the last hearing that you held at my request, and I thank you for that, the Governors of Maryland, Pennsylvania, Virginia have gotten together. They are putting the beginnings together of a program on a regional basis to clean up the bay. Last Friday I was part of a process, along with the Governor of Maryland, that accepted reports from the chairmen of various workshops that were established to devise plans to restore the bay. I understand Governor Robb is doing the same thing, and Pennsylvania is going to follow soon.

There is going to be a Chesapeake Bay conference for December 7-9, at George Mason University in Virginia. Its purpose is to coordinate all those efforts so that by the time that your committee, and I hope we will have my legislation in it, reports out its bill, the three States will have a working group established that will, in fact, be able to make a presentation on their plan to help restore the bay. Then the State officials can go back to their own State capitals with a proposal that will in fact work to clean up this Chesapeake Bay.

Now, what can we do? I represent basically the rural eastern shore. I also have parts of southern Maryland and part of the Baltimore suburbs. Of course the finger is pointed at us all the time about the agricultural runoff for these areas. As you know, this PIK program that we are currently wrapping up with this harvest has had a tremendously, positive effect in cleaning up the waters of the Chesapeake Bay by allowing farmers to take land close to the shoreline out of production.

We have experienced a devastating drought this year. As a result, we need to be careful about the expectations we place on farmers this year.

Through our Soil Conservation Service, which has been encouraging no till farming, we are seeing attempts along our shoreline to stop runoff of the fertilizers that have in the past been so damag-

ing to the water quality in the Chesapeake Bay. So there are practical ways to stop pollution.

The bill I introduced that I am asking you to include in your omnibus bill to reauthorize the Clean Water Act would, in fact, encourage our States to be more responsive. It is not a "big brother" approach where we would attempt to come in and tell farmers how to prevent runoff. We are giving them the financial potential to come up with an acceptable plan for the Chesapeake Bay region.

But again, let me emphasize that it is too big a task for Maryland, it is too big a task for Pennsylvania, it is too big for Virginia. It is too big for the three of them together. The States are going through a tremendous financial scrutiny right now. We are having revenue shortfalls. As you know, many States are required by their constitutions to have balanced budgets, Maryland in particular. The only option they have is to raise taxes to pay for this sort of thing.

Our Governor has indicated he may even be willing to do that. He feels that strongly about the Chesapeake Bay. But we do need the Federal help. If we can show the world, and I think the world is watching us, that the Chesapeake Bay can be restored, it will serve as a model method for preserving estuaries.

As you know, Mr. Chairman, off the coast of New Jersey, there is a critical ocean pollution problem facing us. If we can do it for the bay, I think we can demonstrate that we can deal with any environmental problem in the world.

I again thank you for the opportunity to be here today, and again my purpose is to urge you and your staff to include my bay bill as a part of your overall bill when you mark it up later this year.

Mr. ROE. I want to thank the gentleman for his valuable testimony.

Let me ask you, basically one thought that occurs to me, Roy, in that report—I am sure it is 5 feet thick.

Mr. DYSON. At least.

Mr. ROE. Is there any particular synopsis or breakout in that report that relates to the status of the sewage treatment facility program along the bay? That would affect all three States.

With the cutback that was made in the grant money for our sewage disposal construction program, plant construction program, I am just wondering what effect that has had upon the bay, per se.

One of many pieces of legislation pending now is to try to importune both the Senate and House and the administration to increase the quantitative dollars available from $2.4 billion a year to $4.3 billion or $5 billion as it was before, to accelerate the sewage disposal plant construction program under the Clean Water Act. It would be helpful to us to specifically ascertain what is the situation in the States of Maryland, Virginia, and Pennsylvania on their construction program and how has that slowed down the cleanup program you are speaking about to the Chesapeake Bay. That would be helpful.

Mr. DYSON. We would be glad to get to that information. I can give you sort of a brief summary of what is happening in Maryland. I had a long conversation with our Governor about that because of that very situation. As you know, in Maryland, through

the department of health and mental hygiene, revenues from the Federal Government are given to local jurisdictions or municipalities who in turn, construct the treatment plants.

The Governor is very much concerned because most of the treatment plants are on tributaries that eventually empty into the Chesapeake Bay. He feels that obviously the local governments are not going to be able to come up with the cost sharing or make up that difference. If the Federal Government doesn't make up the difference he is prepared to seek the funds at the State level. It is going to be very costly. We are going to have to pay for it somehow or other, but it is the only thing we can do if we are serious about cleaning up the Chesapeake Bay.

We would be glad to get that information for you.

[The information follows:]

PREPARED STATEMENT OF CONGRESSMAN ROY DYSON ON THE CONSTRUCTION GRANTS PROGRAM FOR THE CHESAPEAKE BAY REGION

Mr. Chairman, as you know, to assist communities with upgrading their Publicly Owned Treatment Works (POTW's) to meet secondary-treatment regulations, the Clean Water Act established the Construction Grants Program. It is a Federal and state cost-sharing program.

The attached table summarizes the Federal dollars spent on the Construction Grants Program within the Chesapeake Bay basin between 1972 and 1983. Basin-wide, nearly 2.5 billion dollars was spent by the Federal government to improve the level of wastewater treatment. When added to the approximately 25 percent share paid by the states, municipalities and local governments, the total amount spent is almost 3.3 billion dollars.

I am also attaching for the record a section of the recently-concluded Environmental Protection Agency's Chesapeake Bay Study that explains the situation in the Chesapeake Bay region with respect to the Construction Grants Program in some detail:

"Data indicating what has been bought by these [construction] grants in terms of water quality improvement are scarce, but nonetheless encouraging. One of the areas in the Chesapeake where water quality trends are improving is the Potomac River. Approximately one billion dollars were spent there to limit POTW loadings. During this period, the volume of effluent (flow) discharged by POTWs in the James more than doubled, yet the BOD_5 load was nearly halved. Nutrient discharges have continued to increase in the James relative to flow because secondary-treatment is the highest level of treatment required there. In the Potomac, there has been a similar increase in flow, but both the BOD_5 and phosphorus loads have been reduced, the latter due to implementation of phosphorus effluent limitations at Blue Plains and other sewage treatment plants discharging to the upper Potomac. Improvements in water quality observed since the late 1960's in the Potomac estuary are principally attributed to these reductions obtained through the NPDES and Construction Grants programs. In areas where nutrients are contributing to poor water quality, secondary-level treatment alone is not effective in curbing phosphorus or nitrogen loadings; some form of advanced wastewater treatment will be needed to limit further nutrient enrichment due to point source loadings in problem areas of the Bay.

"Nutrient enrichment in the main stem of the Bay is currently being addressed by implementation of the EPA's Upper Chesapeake Bay Phosphorus Limitation Policy. This policy, approved by the EPA for funding in 1979, was established to reduce increasing chlorophyll *a* concentration in the upper Bay, an indication of eutrophication. Under the Upper Chesapeake Bay Policy, Maryland and Pennsylvania have imposed phosphorus effluent limits on POTWs impacting this area. In Maryland, the policy requires all point sources with flows greater than or equal to 0.5 MGD discharging into the Maryland portion of the Bay north of and including Gunpowder River (Zone I), or POTWs with flows greater than or equal to 10.0 MGD between Gunpowder River and the southern edge of the Choptank River (Zone II), to meet the effluent limitation 2 mg L^{-1} effluent. In Pennsylvania, state regulations require 80 percent removal (approximately equal to 2.0 mg L^{-1} effluent) of phosphorus of all new or modified wastewater treatment facilities discharging to tributaries

and the main stem of the Susquehanna River below its confluence with the Juniata River.

"Chesapeake Bay Program modeling studies indicate that full implementation of the Upper Chesapeake Bay Policy will only maintain existing point source phosphorus loadings to the Susquehanna River in the year 2000. More stringent phosphorus limitations may be necessary in the future to improve upon the present condition of the upper Bay.

"In the Potomac River basin, phosphorus limitations at the larger POTWs has resulted in water quality improvement of the tidal-freshwater portion of the river. In the Patuxent River basin, the State of Maryland is preparing to limit nitrogen effluent concentrations, as well as phosphorus, in an effort to reduce chlorophyll *a* concentrations in the tidal-freshwater portion and to alleviate low DO concentrations in the lower reaches of the river. Water quality monitoring over a number of years will be necessary to determine the effectiveness of this policy once implemented. Then, based on water quality improvements in the Patuxent, Bay-area states may choose to limit nitrogen from sources contributing to other problem areas around the Bay.

"Although loadings of conventional pollutants and nutrients, to some extent, have been lowered by existing programs, compliance monitoring data indicate that nutrient loads could be further reduced if permit compliance were improved. National EPA statistics on plant performance indicate that at any point in time, 50 to 75 percent of the POTWs are somehow in violation of their NPDES permits. (Statistics may include administrative or effluent violations and do not necessarily reflect the severity or duration of the violations.)

"The Maryland Office of Environmental Programs, Department of Health and Mental Hygiene, estimates that in 1983, six (17 percent) of the 56 major municipal dischargers were not in compliance with either BOD_5 or TSS permit limitations. The Virginia Bureau of Enforcement, State Water Control Board, estimates that in 1982, 21 (37 percent) of the 56 major POTWs were not in compliance with either BOD_5 or TSS permit limitations (VA SWCB 1982). The Bureau of Water Quality Management, Pennsylvania Department of Environmental Resources, estimates that approximately 20 percent of all wastewater treatment facilities in the Susquehanna River basin were not meeting their BOD_5 and TSS permit limitations. A higher percentage of facilities, however, in the lower Susquehanna River basin (below the confluence with the Juniata River) that are required to remove 80 percent of the phosphorus load, are not meeting their phosphorus permit limitations.

"In summary, although loading trends for both POTWs and industries indicate continuous reductions in certain conventional pollutants and nutrients in certain areas, the improvements may be inadequate. Secondary-treatment, the minimum POTW discharge limitation, is not designed to control nutrients, and permit noncompliance is evident. Another concern is the fact that may segments of the Chesapeake Bay system are showing early or advanced signs of nutrient over-enrichment and oxygen depletion that parallel historical trends in the Potomac. The inability of some localities to improve wastewater treatment capabilities in step with population growth and the need for water quality protection indicates that many of the gains made in point source controls during the past decade have leveled off or are being hampered by administrative and technical problems such as operation and maintenance (O&M) deficiencies and lack of pretreatment."

CONSTRUCTION GRANTS PROGRAM FUNDING OF THE CHESAPEAKE BAY DRAINAGE AREA (WITH THE EXCEPTION OF NEW YORK)

[Dollars in millions]

State	Step 1—Planning		Step 2—Design		Step 3—Construction		Step 4—Design/construction		State total	
	Number of projects	EPA amount	Number of projects	EPA amount	Number of projects	EPA amount	Number of projects	EPA amount	Number of projects	EPA amount
District of Columbia	13	$14.2	2	$0.7	5	$165.1			20	[1] $180.0
Delaware	10	0.8	8	1.2	14	33.2	5	$8.4	37	[1] 43.6

[1] This amount represents 75 percent of the eligible cost of the projects.

Mr. ROE. Are there any other questions to the gentleman from Maryland?

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Mr. Chairman, I would just like to comment that I was among the group that went down to the Chesapeake Bay yesterday. Of course we have heard a lot of testimony on it, and we are very familiar with the background of that study. But being there on the bay sort of emphasizes the fact that the Nation's largest estuary is one of our important national resources. It is probably appropriate to make sort of a pilot program study to see how good we are at cleaning up the Nation's water.

Roy didn't mention, I am sure it is in his statement, just the economic impact is tremendous. I think they do about $240 million a year in just maritime commerce, probably all the other economic factors add up to a couple billion dollars in what the Chesapeake provides in the way of the economy of the Mid-Atlantic.

I don't want to digress, but given this opportunity, I will for a moment. In my own district we have a lake that is deteriorating. It isn't an estuary. It is a Corps of Engineers lake, a large one, probably 60 or 80 miles long. At the headwaters of it there are two counties where the population has doubled in the last 10 years.

So you can compare the two to some degree in that we have the phosphorus and nitrogen from agricultural runoff and perhaps to some degree from sewage plants. We have to regulate industrial waste. We have the photosynthesis problem that exists from the browning and greening of agricultural runoff and industrial waste that Dr. Mikursky taught us about yesterday.

Mr. DYSON. Taught us all to become experts, didn't he?

Mr. HAMMERSCHMIDT. And I only mention this in totally supporting our friend Mr. Dyson's interest, but also saying that around the Nation I am sure that we have a lot of problems. We all know this, but I did want to mention I have one real close to home as well. But I do have great interest and support of your effort.

Mr. DYSON. I very much appreciate your coming on the trip yesterday. You added an awful lot to it, along with our colleague from San Diego, Mr. Packard, and the gentleman from Georgia, Mr. Rowland.

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. Mr. Chairman, I want to express my appreciation to our colleague, too, for the opportunity to go to the Chesapeake Bay yesterday. I had not been there before. This was my first trip. And flying over the area I saw that there is a lot of agriculture in that area with a lot of farms right down to the water's edge. The presentation that was made to us about the greening and browning of the water and photosynthesis, as our colleague from Arkansas mentioned, was very good and certainly gave me some insight into what was taking place there.

I had an opportunity to talk with one lady who said, I believe, they were harvesting about a million bushels of oysters now, and several years ago they were harvesting 5 million bushels of oysters. Certainly a great change has taken place in the ecology of that area that I wasn't aware of. It was a very good trip for me, and I wanted you to know that.

Mr. DYSON. Thank you. I appreciate your coming.

One of the things John Paul just talked about is that yesterday we had a particularly beautiful day. James Michener's wife joined us, saying to me just before we started out, you are bringing your colleagues out here on the wrong day. I asked why she said that. She said it should be raining and bleak and cold so they will go away with the impression that we ought to do something about this. And I said no, I don't want them to go away that way. But one of the people on the trip said to me that everything looks fine on the bay. But yet when we pulled into the dock I said you don't see any bay grasses any more in this area, the Kent Narrows, which was once filled with bay grasses. The geese we saw flying over and the ducks we saw on the pond there, they fed on those grasses at one time. These geese live primarily in the Atlantic Flyway, which the bay is part of. These grasses are what they fed on for many, many years.

I am sure you remember seeing some of the people associated with the trip feeding them. People are doing that more and more, and this is not part of the natural system. The natural process is missing now. You know, 400 million gallons of effluent are dumped into the Chesapeake every year. This kind of manmade pollution is catching up with us. If we don't do something, it is going to be at a point where we can't reverse it any more. It is just going to be too late.

We don't believe we are at that point yet and with your help I think we can prevent that from ever happening.

Again, I thank you for coming yesterday.

Mr. ROE. Any further questions of the gentleman?

The gentleman from California.

Mr. PACKARD. Just one comment, Mr. Chairman. I think that the problem our colleague, Mr. Dyson, brings out is a problem that extends certainly throughout the entire estuary of the Chesapeake, but also I think it extends across the country. I am speaking, of course, about nonpoint sources of pollution. I am not sure we have well identified a policy that addresses that issue generally. This is certainly a case in point that is very graphic and important to this area and to the whole country. But I think it extends to all areas, and perhaps at some point in time this committee ought to look at that whole issue of nonpoint sources of pollution.

I think we are finding ourselves in a position of addressing nonpoint pollution in terms of specific areas rather than as a general broad conceptual problem for the entire country.

Mr. ROE. If the gentleman would yield on that point, it is my intent to recommend to the committee that we get into that as a special issue in this whole review of the legislative process.

Mr. PACKARD. I don't think that ought to hold up procedural——

Mr. ROE. No, no, particularly the Chesapeake Bay, of course.

Mr. PACKARD. Or any other specific area that is struggling now. But I appreciate your comment that we are going to be looking at that. I see that as a serious problem all over.

Mr. ROE. Are there any further questions? Well, we want to thank the gentleman for his splendid testimony. We look for that other information on the sewage disposal. I am interested in that from the point of view how it relates in the timeframe of getting the bay further cleaned up.

Mr. DYSON. I think if things stay the way they are and we are not able to meet that obligation, I think we are going to see something dramatic in a negative way, probably in just a very short time. And it seems to run counter to everything we are attempting to do.

Mr. ROE. We thank the gentleman for his testimony.

Mr. DYSON. I thank you for the opportunity to be here this morning, with this intimate crowd of members of your committee.

Mr. ROE. Good.

Our next witness is Mr. Ross Swimmer—is Mr. Swimmer here?—representing the Council of Energy Resources of our Indian tribes; is that correct?

Mr. SWIMMER. Yes, sir.

Mr. ROE. You are going to be filling in for Wilfred Scott; is that correct?

Mr. SWIMMER. Yes, sir.

Mr. ROE. The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF WILFRED SCOTT, CHAIRMAN, COUNCIL OF ENERGY RESOURCE TRIBES AND VICE CHAIRMAN, NEZ PERCE TRIBE

My name is Wilfred Scott, Vice-Chairman of the Nez Perce Tribe and Chairman of the Council of Energy Resource Tribes (CERT). I am please to have this opportunity to testify before this committee on behalf of the 37 tribes that make up the Council of Energy Resources Tribes. CERT urges this committee to adopt amendments to the Clean Water Act that would recognize Indian tribal governments and provide full protection for water quality on Indian reservations.

CERT is a coalition of Indian tribes that own and produce energy resources. Our goal is to assist member tribes develop the capability to manage our resources to provide economic prosperity on our reservations in a manner that is consistent with each tribe's goals. To accomplish this CERT gives tribes technical assistance in economically and environmentally sound resource development practices.

The Indian tribes that belong to CERT produce, oil, gas, coal and uranium. Last year Indian tribes produced over half a million barrels of oil equivalent in these resources. The potential for greater production is tremendous.

Resource development can mean jobs, income and tribal revenues, all of which are badly needed on economically depressed Indian reservations. But resource development can also have serious environmental affects which must be controlled if energy resource development is to be an acceptable path to economic prosperity for Indian tribes.

Environmental quality is particularly important to Indian tribes. The reservations are our homelands to be protected and preserved for future generations. The maintenance of a tribe's limited land base is essential if the tribe is to achieve lasting

economic prosperity. For Indian tribes the land is what ties our people to our traditions and our history.

Managing the environment on Indian reservations, is, therefore, of major concern to the tribes and CERT. Unfortunately the Clean Water Act does not provide adequately for the protection of water quality on Indian reservations. This is so because the Act does not recognize or support the authority or tribal governments to control water quality on Indian reservations.

The Clean Water Act authorizes EPA to delegate to states responsibility for implementing most of its provisions. It also authorizes funding to state governments to support state programs. But the Act makes no mention as to who should regulate on Indian lands nor does it provide funding to support the efforts of tribal governments to do so. The result has been a regulatory vaccum on Indian lands.

States cannot assume authority on Indian lands because Indian tribes are not political subdivisions of states, as are local governments (see U.S. v. Wheeler, 435 U.S. 313, 329 (1978)).

Nor would it be appropriate for States to be given authority to implement the Act on Indian lands. Federally recognized Indian tribes have a direct relationship, established by treaty or executive order, with the federal government. This direct relationship is seen by tribes as essential to the continuation of our existence.

Furthermore, it is to tribal governments that Indian people look for environmental protection. Only tribal governments are able to protect the reservation environments in a manner consistent with the goals and values of the Indian people they represent. But because the Clean Water Act does not recognize a role for tribal governments no one has clear authority on Indian lands.

The tribes wish to reiterate their very strong desire to develop viable, technically sound environmental resource management programs on the reservations. Just as important, the tribes are committed to develop these programs in cooperation with the EPA and affected state agencies and in full compliance with federal environmental legislation and regulations. In other words, the tribes are willing and able to take on the responsibility of environmental regulatory enforcement consistent with federal policies and requirements and in cooperation with the states.

A few tribes have sought to fill this regulatory vacuum with their own programs to control water quality but have met with another obstacle: the Act provides limited support for tribal programs.

The Clean Water Act authorizes financial assistance to all levels of government including tribal governments. But, unfortunately those asistance programs that have served as a critical base of support for water pollution control programs are not available to Indian tribes. Specifically, Section 106 grants which provide comprehensive grants to states to support the administration of programs for the prevention, reduction and elimination of water pollution are not available to Indian tribes. Seciton 201 Construction Grants are technically available to tribes but in order to qualify, tribes have to compete with populated cities on a state priorty list. This is because tribes are defined inappropriately as municipalities by the Act. Thus, tribes are effectively foreclosed from the Construction Grants Program. Also, Indian tribes are not eligible for the Water Quality Management Planning grants under section 205(j) of the Act. This program would allow tribes to develop water quality baseline information and to conduct planning for water quality programs.

Indian tribes are eligible for Section 208 Water Qualty Management Area Waste Treatment Program grants. But, in fact even that source of funding has been foreclosed to tribes as money has not been appropriated for the program since fiscal year 1981.

In spite of the lack of adequate support tribes have not stood by and done nothing to manage water quality. Attachment 1 is a description of the efforts of several tribes in this area. These efforts, largely planning and baseline data gathering, represent a start, but they are far from adequate to protect water quality on Indian lands. But without adequate assistance tribes, like states, lack the resources to develop full regulatory programs.

It was certainly not the intention of the Congress to leave any area of the country uncovered by the Act. Yet that is what has happened on Indian land. The only way to correct this problem is for Congress to clearly define implementation authority on Indian lands and to authorize funding for tribal governments.

The Board of Directors of CERT passed a resolution in November, 1982 calling for amendments to the Clean Water Act that would provide tribal governments with recognition, authority and assistance equal to that given the states (attachment 2). Based on that resolution CERT urges Congress and this committee to amend the Act so that EPA would be authorized to delegate authority for implementing all provisions of the Act on Indian land to tribal governments. It is anticipated that

only the larger reservations with significant surface water problems will participate in water quality management programs on this reservations. When a tribe is not able to assume authority or does not wish to do so EPA should have authority to carry out the Act on Indian land. Furthermore, those assistance programs which have provided the backbone of support for state programs should be made available to tribes.

By incorporating these recommendations as amendments to the Act, the Act's deficiency with respect to Indian lands would be corrected in a manner that is consistent with the historic relationship between Indian tribes and the federal government. This solution would recognize the proper role and responsibility vested in tribal government by their citizens to protect their land and their people.

CERT believes that our recommendations are in the interest of sound public policy and environmental health. They are also in the interest of Indian tribes striving to responsibly exercise their right of self-government. CERT's recommendations would ensure that tribal governments have the authority and the means to manage water quality for the benefit of present and future generations of Indian people.

ATTACHMENT 1.—PARTIAL LISTING OF TRIBAL INITIATIVES TO CONTROL WATER QUALITY

Tribe	Water quality problem	Project outputs
Southern Ute	Agricultural Pollution, soil erosion, salinity	Best management practices, guidelines for farming.
Ute Mountain	Salinity, soil erosion, irrigated agriculture	Guidelines for farming practices.
Blackfeet	Agriculture pollution, oil and gas drilling, timbering, hydroelectric.	Water quality standards, compliance and enforcement program, instream flow requirements.
Northern Cheyenne	Instream flow, mining	Water code development, source inventory and assessment, mining best management practice.
Fort Peck	Power plant impact on Popular River	Source inventory and assessment, water quality standards and classifications.
Fort Belknap	Domestic wells, septic tanks, mining	Source inventory and assessment water quality management plan.
Flathead	Agriculture, domestic sources, oil and gas	Water quality management plan.
Rocky Boys	Septic tanks and lagoons	Water quality inventory and assessment.
Crow	Agriculture sources of pollution, toxics, energy development.	Point source and nonpoint source inventory and assessment, management strategy.
Fort Berthold	Agriculture nonpoint sources, erosion	Instream studies, inventory and assessment.
Turtle Mountain	Agriculture pollution	Best Management practices and guidelines for agriculture.
Frandreau	Individual septic systems	Assessment and remedial action.
Standing Rock	Septic systems, stream bank stabilization, rangeland.	Inventory and assessment.
Crow Creek	Waste water treatment, stream bank stabilization.	Do.
Cheyenne River	Rangeland, septic tanks, heavy metals	Do.
Lower Brule	Irrigated agriculture, septic tanks, rangeland	Do.
Yankton-Wagner	Streambank stabilization, landfills, agriculture septic systems.	Do.
Pine Ridge	Rangeland, mining septic systems	Do.
Rosebud	Rangeland, septic systems, pesticides	Do.
Siseton-Wapheton	Agriculture, septic systems, lakes	Do.
Northern Utes	Lake eutrophcation, nonpoint sources	Do.
Navajo	Nonpoint sources, grazing, mining	Do.
Wind River	Nonpoint sources, agriculture, septic systems	Do.

Mr. ROE. Please proceed.

TESTIMONY OF ROSS SWIMMER, PRINCIPAL CHIEF, CHEROKEE NATION, ON BEHALF OF WILFRED SCOTT, VICE CHAIRMAN, NEZ PERCE TRIBE, REPRESENTING COUNCIL OF ENERGY RESOURCE TRIBES

Mr. SWIMMER. Mr. Chairman and members of the committee, I am Ross Swimmer, principal chief of the Cherokee Nation. I am filling in for the chairman of the CERT organization, Council for Energy Resource Tribes, Mr. Scott, Vice Chairman of the Nez Perce. I serve on the executive committee of the CERT organization and my testimony is on behalf of the member tribes of that organization, and all tribes that have waterways running through the reservations or Indian areas.

Mr. ROE. Could you explain a point just for the record? What is the connotation of the Council of Energy Resource Tribes? What does that mean specifically?

Mr. SWIMMER. Yes, sir. The Council of Energy Resource Tribes is an organization that was formed several years ago in an effort to provide technical assistance to energy tribes that are predominantly energy Indian tribes, in other words, that have energy resources on the reservations or Indian country. There are approximately 37 members of that organization. It is simply corporate—its corporate status is a nonprofit organization that is set up to provide this technical assistance. It is estimated that today, nearly 20 percent of all America's energy resources are located on Indian tribes' reservations. In the past the tribes have not fared to well in negotiating agreements, so the CERT organization stepped in a few years ago, was incorporated by a few tribes, has grown to 37 tribes, and its purpose is to provide this technical resource to tribes that are attempting to develop their energy resources.

Mr. ROE. Are we speaking of all types of energy resources, hydropower, oil?

Mr. SWIMMER. Yes, sir. You have entered our prepared statement into the record, and I will speak to the statement, a few comments, if I may.

Mr. ROE. Without objection.

Mr. SWIMMER. The energy resource tribes of America consider one of their major assets to be energy, and the energy resources under their lands. This is geothermal, uranium, coal, oil and gas, practically any kind of energy resource imaginable is on Indian country. If we are to develop these resources, it means the possibility of pollution. It means getting into the water and getting into water quality problems. We are very concerned that the Water Quality Act does not provide a vehicle for the tribes to address the water quality problems. What is being proposed is that there would be a delegation to the States of certain authority to manage their water resources, and I suppose indirectly that this is in anticipation to be applied to Indian tribes. This won't work.

There is right now a situation where tribal governments do have a government-to-government relationship with the Federal Government. There is no State authority over tribal lands. So what happens is that we have a vacuum, in effect, that no one really watches what happens on the reservations or in Indian country, especially in regard to the water that flows through these lands.

We consider it to be of primary importance that the water quality be governed by the tribes which own the water where it flows through Indian country. We at least would like to have the opportunity to have in the act a provision that delegates this responsibility to Indian tribes as it does to States.

In the event that Indian tribes choose not to exercise that delegation of authority, we would ask that the water quality standards be maintained by the EPA. Not by the States. In other words, that authority stay with the Federal Government in regard to Indian tribes and that it not be delegated to State governments. There are several provisions in the act, like section 106, that makes grants to States to support the administration of programs for the reduction, elimination of water pollution.

These grants are not available to Indian tribes. We have section 201 construction grants that are technically available to Indian tribes but practically are not because Indian tribes would have to compete with other municipalities for these grants, and in the act, I believe that the tribal governments are classified as municipalities, which is a mistake. They are not. They should not be, and they should be identified simply as Indian tribes.

We have other sections such as 205(j), water quality management planning grants where tribes are not eligible at all. While we are eligible for the 208 water quality management area waste treatment programs grant, no moneys have been appropriated. We would like to see in the act for Congress to define the implementation authority on Indian lands and to authorize funding for tribal governments so the tribal governments can regulate water, water quality, what is going to happen to it and how it is going to be treated as it goes through Indian country.

That is the basis for our position today. What we would like to see included in the act. We did last year present a resolution from the CERT board of directors that contained the specific comments and requirements we would like to see in the Clean Water Act. And I would appreciate a review of those, and have the opportunity for you to consider including those in the Clean Water Act when it is passed.

Mr. SMITH. Mr. Chairman.

Mr. ROE. The gentleman from Oregon.

Mr. SMITH. Thank you, Mr. Chairman.

I represent several tribes in the West. I am interested in your request, and want you to clarify it for me a little further than you have. If I understood you, you wanted the Clean Water Act controlled by the tribes rather than the States, is that what I heard you to say?

Mr. SWIMMER. Yes, sir; as there is a delegation in there to States that choose to assume that delegation, we would like a delegation to tribes to assume the same jurisdiction. In the event of a conflict that might arise, say a stream flowing through tribal land and State land where there was a conflict in policy, we would ask that EPA resolve that conflict. Otherwise, we would appreciate us having the opportunity to address the water-quality problem as the water flows through Indian country.

Mr. SMITH. For further clarification, only in the time of conflict between the State and tribe would you want EPA, or would you want EPA——

Mr. SWIMMER. Yes.

Mr. SMITH. If the tribe did not——

Mr. SWIMMER. If the tribe chose not to exercise the delegation, then we would ask that EPA come in and make a study and work with the adjoining State, if there is one, or whatever the situation is, to work out the policy for the tribe. We would ask that that stay with EPA and not be delegated to the State.

Mr. SMITH. What kind of example could you envision in which the tribe and State might be at odds about that would be to the detriment of the tribe?

Mr. SWIMMER. I wish I could. I would imagine that right offhand it could have something to do with energy resource development, such as uranium or coal, that might be extracted from Indian country, and not be involved in the stream further down. And that a tribe might be dealing with an energy company that would have some problem with the water quality that is affected on the reservation, but then would not be as the stream flows on through.

That would be an example that comes to mind immediately. I cannot cite you a specific example of what we are asking for in this regard other than that.

Mr. SMITH. I would be happy to visit with you about this. I am just worried that we divide up the jurisdiction so much that we create further conflicts of interest rather than preventing them. I wouldn't want us in a constant battle in the courts about where we stand and whose water is affected.

Mr. SWIMMER. I think that can be corrected in the act which would show that if there is a conflict, EPA would step in and set the standard. But that involves tribal government, and State government, and Federal Government. Where we have a sovereign within a sovereign, that that should be the organization that has the ability to management and regulate the water quality that flows through its land, just as we are asking that States have that opportunity.

I don't think, I really don't see that it would be a serious conflict. As it is now, Indian tribes would be almost impotent to do anything. The State is pretty much responsible, and except on that strip of Indian land where the State really has no jurisdiction, other than what might be conferred by this act, we wind up with a vacuum, where an Indian tribe really has nothing to say about what happens and the State may be considering a situation that is totally different from what is happening on the reservation.

We also have conflicting laws on reservations now where tribes have their own tribal courts or tribal laws, and their own government-to-government relationship with the Federal Government which is going to make it very difficult, then, for a State to come into a reservation and say this is what you are going to do or this is what we want to do. It helps us down here. But you need to do this, too, without having the tribe be able to say, well, wait a minute. We need to have something to say about this situation.

And by law, by the Clean Water Act, we do have a right to say something. It also provides the—what we are asking for would pro-

vide the tribes with the opportunity to have funding to do some of the construction projects, some of the planning projects and to hire people who are capable of working with tribal governments to manage this water-quality problem.

Mr. SMITH. That portion I am really not concerned about. I am concerned about somehow this interfering with what at least in the West has been a very sensitive issue, and that is the issue of water rights and how they are distributed between not only Indian tribes, but also States rights in water, and also individuals' rights in water.

As you know, we live and die by water, or the lack of it, in the West. And any kind of intrusion into those rights by law of the Federal Government, without knowing it, would interrupt tremendously what has been occurring in a rather quiet, peaceful arena to date.

Mr. SWIMMER. I am not sure that it is rather quiet and peaceful. It might be. It might be right now.

Mr. SMITH. It depends on where you are.

Mr. SWIMMER. Yes, sir; I understand that. I don't see that this would usurp anyone's jurisdiction over the ownership or the use of water. Those are decisions that will ultimately be made later, either by courts or by agreement. But as the water does flow through the tribal reservations anyway, that is where we are particularly seeking jurisdiction of the quality and management of it.

Mr. SMITH. As you know, we are battling now what happens to the fish that swim through the waters that go through the tribal lands.

Mr. SWIMMER. True.

Mr. SMITH. Thank you.

Mr. SWIMMER. Thank you.

Mr. ROE. Are there any further questions of the witness?

Mr. Moody?

Mr. MOODY. I am looking at the statement that says only tribal governments are able to protect the reservation environments in a manner consistent with the goals and values of the Indian people they represent. When you have an ambient substance such was water which flows through jurisdictions, how practical is it really to have one jurisdiction with its own administration of standards or decisionmaking on standards, yet without it affecting other jurisdictions. This is a moving substance, water. It moves in and out of the jurisdictions in question. Is it practical to have different, as you call them sovereign, entities making separate decisions in this way? Doesn't there need to be a uniform, some uniformity? Isn't it more practical to have as large a unit as possible handling these kinds of questions in our Nation, rather than having subdivisions, I mean States are about the biggest units we have short of the Federal Government. Isn't that sort of a practical unit of government to handle this kind of problem rather than breaking it down into small units such as tribal governments?

Mr. SWIMMER. Well, I think that the problem can be solved by delegating the tribal governments without affecting that management problem. There are areas, for instance, the Navajo, that that land mass is much greater than the size of several States. There are other Indian tribes that have several million acres of land that

would be equivalent to the size of many States in the East. So we are talking about some pretty large land masses. We are really not talking about a situation where the reservation is on a 5-by-5 mile square area and a strip of water flows through and we are saying this is ours and the rest of the State is yours.

We are talking about some pretty big areas that are covered, and I think that for that reason, it would be good that the tribal governments begin this responsibility so they can have something to say about that water that flows through their reservation area. Just as it has been proposed to delegate to States, I don't think we are talking about that many more jurisdictions, really.

As it goes from one State to another, there are likely to be some, maybe not problems, but at least concerns that both States will have to address and come to a meeting of the minds on. Essentially, that is what we are asking for, is that the State and tribal governments would address the issues, come to a meeting of the minds, and if they don't, the EPA would resolve differences.

Mr. MOODY. I will grant you that some Indian tribal areas are bigger than some States, that is in the extreme true. But there are also little tribal areas that are little parts of a State and you do get the problem I mentioned.

Mr. SWIMMER. Sure.

Mr. MOODY. Would you apply the same principle to clean air, ambient air that traveled across jurisdictions?

Mr. SWIMMER. Yes.

Mr. MOODY. You think tribes should also control the air above——

Mr. SWIMMER. Yes, sir.

Mr. MOODY. Independently of a separate jurisdictional responsibility?

Mr. SWIMMER. I think they should have a code of laws consistent with the Clean Air Act and should have something to say about that. Both of these issues, water and air, are directly affected by energy resource development. Much of that energy resource development is going to happen in Indian country. For that reason, I think the tribes should have something to say about both those areas.

Mr. MOODY. One last question if I could, Mr. Chairman.

Mr. ROE. Sure.

Mr. MOODY. Do tribes have the administrative capacity, the bureaucracy, in effect, to match the competence of States in this area?

Mr. SWIMMER. I would say in many cases they do, but also in many cases they don't. I would say that the latter is a problem now and that, yes, we do have to establish competency in this area. Part of that establishment of competency would come from adequate funding of this particular act that would allow us to hire the professional and technical people to carry it out.

The same applies to States. I don't know if very many States have that ability to manage today. So we are both growing. We are both learning about this area, but there is nothing that would prevent a tribe because of its organization or tribal government from acquiring those skills. Essentially, that is what we would like to do.

20-955 O—84——66

It also is an economic benefit, of course, to Indian tribes to do this, and to train their people in water quality control and things related.

Mr. MOODY. Thank you.

Mr. ROE. I think for clarity in the record, I don't know whether this is coming through the way you mean it to come through. No. 1, what we are saying is that there is a particular relationship that exists between the Indian tribes and the Federal Government which is separate in part and in large measure from that which you would have with the State. In other words, the tribal lands under much of the Federal laws also are handled as if it were a State in that sense, is that correct?

I am saying that because of the special laws that exist between the Federal Government and tribal lands there is a direct relationship between the tribal lands, and Federal Government, per se.

Mr. SWIMMER. Sure.

Mr. ROE. Basically. So if we are talking about 20 percent of the energy resources being on tribal lands, and as the tribes in themselves and councils decide as to how they are to develop their lands and how they are to make their own economic units out of their lands, they have a responsibility. That is what you are saying basically.

Mr. SWIMMER. Yes, sir.

Mr. ROE. Therefore, for example, if somebody is going to develop an area, just for clarity of the record, if somebody is going to develop an area for coal slurry, or mining coal, or whatever, they are going to be creating nonpoint sources of pollution basically. So there is a void is the point you are making in the interrelationship between this act and how we deal with that kind of development on Indian lands where they have the right to do that development under Federal jurisdiction, isn't that correct?

Mr. SWIMMER. Yes, sir.

Mr. ROE. Therefore, you are coming back and saying it is not a question of a confrontation with the State. It is that we are going to develop our Indian lands. We are polluters. Everybody is polluters.

Mr. SWIMMER. Yes.

Mr. ROE. So there has to be an interrelationship there. If the State doesn't have the total jurisdiction, why not kind of marry those two jurisdictions up so we can achieve the goals we are trying to achieve.

Mr. SWIMMER. Very well put. Yes, that is exactly what I am trying to say.

Mr. ROE. If the gentleman from Oregon would yield. What you are saying, as I understand it, it is not a confrontation on water rights, those issues are there anyway. We are simply saying how do we tighten up the whole operation so we can work together to achieve the goal.

Mr. SWIMMER. That is right.

Mr. ROE. Just because I don't know, for clarity, say for example that on one of your reservations you decided to establish an industrial park or development. You would have the right to do that.

Mr. SWIMMER. Yes, sir.

Mr. ROE. Therefore, the effluents from those particular facilities and so forth, they could easily be coming into the headwaters of a river going to another State. So it is vitally important what you folks do with your authority and responsibility on your pollution control on your land as relates to other States.

Mr. SWIMMER. Very much so, yes, sir.

Mr. ROE. Isn't that the pattern you are trying to establish?

Mr. SWIMMER. Yes, it is.

Mr. ROE. The gentleman from Pennsylvania?

Mr. CLINGER. Thank you, Mr. Chairman. I think Mr. Moody basically asked the questions I was going to ask. But for my clarity's sake, under existing law who is responsible, EPA or the State?

Mr. SWIMMER. EPA at this time.

Mr. CLINGER. So it is a sovereign-to-sovereign relationship existing?

Mr. SWIMMER. Yes, sir.

Mr. CLINGER. I think your answer to Mr. Moody was that you felt that, whereas the competence level might not exist on the reservations now, given the funding you could develop that expertise?

Mr. SWIMMER. Yes, sir, we certainly could. We have a list of several tribes that have, in fact, begun water quality programs that is attached to the testimony. So we are in the business of doing that now to some degree even though we don't have the funding to do it. But we have done it out of necessity because there is that void or that vacuum between jurisdictions, and the States just don't have the authority to come into Indian country and regulate.

Mr. ROE. If the gentleman would yield, when you have that kind of situation where there would be a critical relationship, who would do that now, EPA?

Mr. SWIMMER. EPA.

Mr. CLINGER. Under the existing setup, of course, all States have some agency or bureau that is responsible for this.

Mr. SWIMMER. Yes.

Mr. CLINGER. So we are really saying that you have a ways to go to get to the point where you would be able to do this. How many tribes are we talking about? In other words, if this were to become part of the law, how many tribes would be involved?

Mr. SWIMMER. I wish I were prepared to answer that. I would say less than 30, but I can't speak with authority on that because I am not sure. It is mostly in the West, and I am not familiar with every tribe that might have that particular problem. We represent 37 energy resource tribes. There might be 37 rivers for all I know. There probably are. So we could be talking about 30 to 40 tribes that would be directly affected by it. Others that might be somewhat affected by it. I don't know.

We have a river that flows through our area, in fact, that is owned by the Cherokee Nation. We have problems there. We have a different situation than most of the tribes in the West, however. What possibly could be done is the tribes would delegate all responsibility to the State. By mandate of Congress, of course, Indian tribes could be put under State law. We would reject that idea, however, because of the other problems inherent in the reservation economy and reservation thinking and reservation development.

And we would prefer that it stay either under EPA, or that those tribes that can, develop their own water quality programs.

Mr. CLINGER. But if they were unable to or chose not to develop their own water-quality programs?

Mr. SWIMMER. It would remain with EPA.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman. I think I have some of the same concerns that have been expressed by other members of the committee. At present, many States have regulatory policy that extend beyond what the Federal Government has. The Federal Government establishes minimum quality requirements. Then States may, and in many cases do, mandate stricter requirements. They cannot abrogate the national standard but they can certainly implement a more strict policy of their own. It would appear to me that if you had Indian territory in a State that would render a portion of that State territory and boundaries inconsistent with one another, it could create some conflict.

I would have some concerns about granting to the Indian government complete liberty to establish their own policies, perhaps irrespective of the Federal or State governments. I have five Indian reservations in my small district. They are not the size of Nez Perce, or Apache, or the Navajo Tribes. These are small reservations that I can drive across in 15 minutes. And they are contiguous, one with another, so I could drive across all five in a matter of 20, 30 minutes.

A river runs through almost all of those, and there are major, major concerns now about water rights, and mineral rights, and energy rights in that basin. Their lifeblood depends on it. There may be only 250 members of that whole tribe, and the tribal government may be absentee. They don't live on the reservation. They live somewhere else. I can see under something of this nature where you would have five different tribal governments determining policy that affect a small area of my district, and certainly a smaller area of my State that could throw into total confusion any consistent policy between State and Federal Government.

Mr. ROE. If the gentleman would yield on that. However, again I think that we have got two ships that may be passing in the night in the discussion here. That is not what the gentleman is suggesting. In my understanding, let us take that specific case. It would seem to me that is the art of our ability to write legislation that would accommodate these particular issues.

For example, let's take a hypothetical case, your case, specifically in the State of California. If the California regulations were higher, which is the case in many States, in water-quality requirements than, for example, the Federal Government had established, that could be written into the law. If the Indian nations were located within that State, that would be a higher level of water quality for everybody within that State and its political subdivisions including Indian tribes would have to inure to.

What he is saying is something else unless I get you all wrong. He is saying one point. That there is a void now in the development of those lands as it relates to the Federal water quality because there isn't an interrelationship. I don't think the gentleman is speaking to abrogating or setting the Indian lands up as a sepa-

rate government. What he is coming back and saying, it is a separate government. We want to be treated equally as we would treat a municipality.

Is that a reasonable point to make? That is what I am interpreting.

Mr. SWIMMER. That is exactly right. This void does exist, and States don't have control. In effect, the water quality that is established in those five little tribes isn't under control of anybody at this time.

Mr. PACKARD. If that is in fact the case, then I think that there is a point that needs to be made.

Just as I would have concern about five different Indian governments having their separate policies interjected into a State geographic area, so I would have some concerns about one geographic area interjecting into a State and having a different policy. I would have some concern if there was a specific area—namely, tribal lands—that would live by national standards, whereas the rest of the State surrounding those tribal lands would live by a State standard that might be more strict.

Mr. ROE. If the gentleman would yield, that specifically is the point. For example, let's suppose you have a piece of land that is Indian land located within the State. It has an Indian relationship with the Federal Government which abrogates the State. Therefore, if you are developing any of the Indian lands, if you are developing municipal lands at that point, or they want to develop Indian lands rather, it kind of messes up the State.

I think what they are saying is create another level. I don't think you are saying that you are. You are not talking about setting up a separate policy in your determination about water quality. You are saying that what we want to do is be counted as part of a whole.

Mr. SWIMMER. We want to be consistent, yes, absolutely.

Mr. ROE. If you had an economic development situation on your lands and it was going to potentially create a nonpoint source or point source pollution, as it is now, that would be EPA negotiating with you rather than the State; is that correct?

Mr. SWIMMER. Yes.

Mr. ROE. What you are saying is let's create some mechanism where we as Indian tribes can work with the States, as I understand it.

Mr. SWIMMER. Absolutely; and develop a policy consistent with the surrounding area. Rarely would we have an opportunity to conflict, in my opinion. If a conflict, in anybody's imagination, happened, EPA would settle it. What we are trying to say is that as municipalities of certain authorities to deal within the State, tribal governments would, and we would be able to work to develop policies that were consistent with the Federal policy and State policy that surrounds us.

Mr. PACKARD. If what you are saying is that Indian lands would live with the rest of the regulations the rest of the State lives with——

Mr. SWIMMER. Essentially that is right. Regulatory authority would be something else.

Mr. PACKARD. This is what my perception was, that you would be asking that you live by Federal standards and not have to report to State standards. Then I would have some concerns.

Mr. SWIMMER. No. The other issue would be regulatory control; that we would want to regulate those standards, but that the standards would be consistent. We are not asking for the ability to set a standard that is inconsistent with any other standard. It is just that once it is set, we want to be able to regulate it.

Mr. ROE. The gentleman from Oregon.

Mr. SMITH. Thank you, Mr. Chairman.

Are you suggesting that there be a third party, the Indian nation, involved in the question of the State and Federal Government? Or are you suggesting that all you want is to be recognized as an integral part of the decisionmaking? Please answer that.

Mr. SWIMMER. A little bit of both. In fact, the Federal Government delegates to the States now. The States, by that delegation, do not have specific authority in Indian country. We are asking that that authority, particularly regulatory authority, be delegated to Indian tribes. But we would be consistent.

Mr. SMITH. This is going to be a third party involved in the discussion, Mr. Chairman, now. We have the State and Federal Government now. What he is suggesting is—as I understand it—a third party. Frankly, that concerns me.

Mr. ROE. Just again—I don't mean to belabor the point; I want to be sure I understand this—let's take a case where we have Indian lands in Oregon. You would be coordinating with the State almost in the same relationship as a municipality would.

Mr. SWIMMER. Absolutely.

Mr. ROE. What I am trying to get at, Bob, if any language is written to accommodate that goal, then it has to be language that goes in that direction. That is what I want to be sure you are asking for.

Mr. SWIMMER. I think we could even accept a situation that would say that the Indian tribes would be consistent in the regulations with States and/or EPA policy, but that regulatory enforcement of these policies would be left with the tribes.

Mr. ROE. As it would be the responsibility of a community or city responsible to regulate according to Federal and State standards?

Mr. SWIMMER. Yes, sir.

Mr. SMITH. Mr. Chairman, let's just carry it again. I don't want to belabor this.

Mr. ROE. It is an important issue.

Mr. SMITH. It is an important issue.

Mr. ROE. It is.

Mr. SMITH. Because, you see, as I understand what occurs today—let's take the State of Oregon—if there is a problem on the Columbia River with water quality, all concerns, be it within the State—and there is Federal land there and there is also an Indian tribe on the Columbia River—so Federal and State people reach an agreement. It is either the State of Oregon or the Federal Government. Both have water quality standards that must be met. So if there is conflict, they finally get together reflecting all rights.

If you are suggesting there be a third party, that the Indian nations be treated separately somehow in this discussion, then that is my concern. If you are suggesting the Indian tribes only be consult-

ed as are other Federal users of water or Federal interests in water along that Columbia River to the decision, then I have no problem with your point.

Mr. SWIMMER. OK. You are essentially right. That is what we are asking for; and that we would simply be consulted about what is going on.

Now, regulatory enforcement of those policies once established, however, is something else, because we don't have—the State or Federal Government doesn't have the ability to come into that reservation area and make those people do what they are supposed to do. So we are asking that there be a delegation of regulatory enforcement directly to the Indian tribes so they can be——

Mr. ROE. As would be delegated to a city or multiple group of municipalities. You are not asking for any more than that?

Mr. SWIMMER. That is right. We are not asking for a third arm of government to set up a separate set of policies that would possibly conflict, but simply in that regard be consulted, know what the policy is going to be, and then be able to enforce it in our country.

Mr. ROE. The gentleman from Nebraska.

Mr. DAUB. Mr. Chairman, if I might just—this is important. We have three reservational situations in Nebraska. I want to ask it again.

You have us all very, very interested in your view, and I read the testimony quickly that you put before the committee. You are not asking for any direct relationship to be established between tribal government and the Federal Government with respect to the law. You want the tribal circumstance to be as if it were a municipality within the boundaries of the State in which it resides?

Mr. SWIMMER. Yes.

Mr. DAUB. I don't want to put words in your mouth. That is a question I am asking. Because I didn't get that from the testimony.

Mr. SWIMMER. We want it to be as a tribal government within the State boundaries; not as a municipality. We are now in the act as a municipality. We don't want that designation. We want to be designated as a tribal government with the government-to-government relationship with the Federal Government.

Mr. DAUB. That is where I am having trouble.

Mr. SWIMMER. I think we are talking about regulatory enforcement more than policy. I think we could live with a situation that says we have the opportunity to work with the State and Federal Government in developing the policy. But then once it is developed, that we do want the authority; then to administer that policy and to regulate that policy, and to do that we have to have those resources as municipalities do now.

Mr. DAUB. I am left, and this is my final thought, with the impression that you are testifying in favor of—and I worked on the Constitution Rights Subcommittee in the Senate, and was involved with constitutional rights of native Americans, got into a lot of tribal law and a lot of contract law—a direct Indian nation-Federal-State relationship that would bypass essentially municipal and State EPA law and regulation. That is what I view the testimony as, and what I view your last statement as meaning.

Right or wrong?

Mr. SWIMMER. That is right.

Is that in conflict with what I have told you, Congressman Smith?

Mr. SMITH. Well——

Mr. DAUB. I have got my question asked and answered. I didn't mean to take anyone else's time.

Mr. SWIMMER. We do want a government-to-government relationship with the Federal Government. We do believe we can be consistent with the policy that the State and Federal Government develop, but in that relationship we expect to have the authority delegated to the tribes to manage water quality on Indian reservations.

Mr. DAUB. I am not trying to indicate how I feel; simply to get you to answer the question.

Mr. SWIMMER. I understand. Maybe I am being vague about it.

Mr. ROE. Are there any other questions?

I think we have exhausted it, but I am still confused. As chairman of the committee, I would like to be helpful because maybe I am seeing—I don't have any tribes in my district. I have a lot of people in my district, but I don't know if there are any tribes or not.

Mr. PACKARD. Mr. Chairman, may I ask one more question in light of what Mr. Daub asked? This is my concern, too.

Assume, in the case I referred to earlier, the Federal regulations are in place and every State and every jurisdiction across this country has to live at least to the minimum level of standards that the Federal Government has established. If a State has added to those regulations or at least has a stricter policy at the State level than the Federal, in such a situation, if there were one or more tribal reservations in that State, with your recommendations and desires, what policy would the Indian government have to live by?

Mr. SWIMMER. Federal.

Mr. PACKARD. And not the State necessarily?

Mr. SWIMMER. Yes, sir.

Mr. ROE. We will see that is contrary to what we said earlier. I would have to rebuff that, too.

Mr. SWIMMER. I am, too. I apologize.

Mr. ROE. No, no. Let's assume there is a flood control program important to a whole region of which you are a part. As it is now, the Federal Government would negotiate with you on that issue, would it not?

Mr. SWIMMER. Yes.

Mr. ROE. You are coming back and saying all Americans ought to be treated alike and we ought to have the right to determine what our interests are, local level, to what that flood control situation is, I would think.

Mr. SWIMMER. But as we said in the testimony, if in fact we conflict——

Mr. ROE. No, no. I am not quarreling about the remedies. I am trying to get the thesis of exactly what you are looking for.

It would seem to me we have small quantities of Indian lands and vast quantities of lands. We are talking about enormous energy supplies being on the Indian lands and they want a certain amount of determination on the Indian lands themselves to be able

to make those decisions. Some of the decisions made on the Indian lands can have a very marked influence.

If you are going to develop a refinery, certainly the requirements ought to be such that effluents from the refinery which goes into the water which goes down to affect another part of the State ought to have some kind of consistency. But we ought to also have a right on the Indian reservation to be part of those recommendations, as any municipality would have.

That is how I hear you. If so, it would be of advantage to the overall water quality program to have some interrelationship. But if it is going to be a separate confrontation, so to speak, with the Indian tribes saying, well, we want to go by a different set of rules, then we would have difficulty with that.

I don't think your testimony clarifies that point.

Mr. SWIMMER. I think that maybe there is not the understanding that we should have. What I am saying is that we do want the regulatory authority. We want the Clean Water Act and authorities contained therein to be delegated to Indian tribes. We do want the ability to set regulations for the use of—for the water quality in Indian country. We are asking for that.

The issue has been brought up several times about, well, what happens if that policy we set in Indian country conflicts? Our response is that EPA would then be the organization to set the policy, that we would deal with EPA. And that gets back to your question that, no, the State does not have superior authority over the tribe if it sets a different water quality standard outside that reservation, and would come on to the reservation and say, well, this is what we have set; yours needs to be consistent. We would say no. We need to go to EPA and ask EPA to review the situation and for EPA then to set that standard.

Mr. ROE. Again, let me just make this final observation: The committee, this committee and the Public Works Committee with all of its vast jurisdictions in economic development and everything else, have been enormously sensitive and very much so toward the rights of our Indian heritage, if you like. We have been very, very sensitive to that. In fact, this committee has broken all kinds of old precedents and we have written equality every place we can into a law.

But I don't think your position is clear enough for us to understand precisely what you want. I don't want to nail you down today. I think you ought to think it out further for just one reason alone.

The committee had developed over a period of years recognition that regionalization of many of our water supply systems was vitally important for the integrity of the system itself. For example, on the Delaware River basin, I just made a speech yesterday and dealt with four different States, the States of New Jersey, New York, Pennsylvania and Delaware. Our concern was how do we maximize the optimum yield of those water resources in the whole gamut, protecting fisheries resources, protecting whatever?

In the course of the discussion, we determined that it was very fortuitous indeed that the Delaware River Basin Commission was established by an act of Congress. It is not a regional organization that was established by Executive fiat, as has been the case in

many areas throughout the country. So there is an enormous tool to be able to work with.

What happens to that river and its tributaries and all of its relationships on natural resources is critical to those four States. Therefore, we can't have one State going off in one direction, one State in another direction, or we have citizens in different areas saying, hey, look, we don't want that pump diversion there because it is going to hurt our area. Somebody has to make decisions someplace or nothing is going to happen.

I think the concern of the committee that is coming through now is that if we set up another governmental agency called the "Indian Rights Group" now, we have a different situation existing. We are looking to get the maximum optimum yield of those natural resources in a coordinated process. So we are sympathetic as far as the committee would be concerned in Indians' concerns and Indian Americans' rights, but we have to get into this a little bit more so we better understand what level we could even be accommodating to you.

Do you see what I am trying to get at? And I don't think we are getting to that this morning.

Mr. SWIMMER. Well, I appreciate that.

Mr. ROE. So I would like to suggest that if the gentleman and committee agrees, why don't we put you on hold and make this the first part of your testimony, because we are going to have a lot more hearings, then get back into this a little more. Maybe consult a bit, then get back to this and testify with a little more refinement to what your presentation is.

Could we ask you to do that for us?

Mr. SWIMMER. Certainly may. I appreciate that and apologize for being unprepared to some degree.

Mr. ROE. It is not an apology necessary. It is a very vast issue. We want to be sure we understand precisely what we are talking about.

Mr. SWIMMER. Surely.

Mr. MOODY. Could we ask the witness when he does come back to address a particular question I didn't get to ask but I think would be relevant. If you did have two different sets of standards with the State, let us say being a lower standard than the tribal standard, suppose the tribal standard was higher under this sovereignty principle, it could be as I understand your testimony.

Mr. SWIMMER. Yes, sir.

Mr. MOODY. Would the State with the—would the tribe have the right then to sue the State, take it to court for water that passed from one part of the State into the tribal area? Would the State find itself in that court where you have a moving resource, moving between jurisdictions?

Mr. STANGELAND. The same would hold true in that case as holds true today. If a lower State in a watershed sets a higher standard than an upper State, can the lower State sue the upper State. I question if they can.

Mr. MOODY. That is what I am asking, would they have exactly the same standing the State would have to sue.

Mr. SWIMMER. I think they would. I think that would be, of course, that obviously can be mandated by Congress, too.

Mr. ROE. OK. If there are no further questions, we want to thank the gentleman and look to hear from you further, because I think you are bringing forth an entire re-review of the relationships between our Indian reservations. So we thank you very much. We will be calling you back again, Mr. Swimmer.

Mr. SWIMMER. Thank you, Mr. Chairman. I assure you I will be prepared for you.

Mr. ROE. Our next witness is Mrs. A. Reid Johnson, clean water chairman for the National Affairs and Legislation Committee of the Garden Club of America.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF MRS. A. REID JOHNSON, CLEAN WATER CHAIRMAN, NATIONAL AFFAIRS AND LEGISLATION COMMITTEE, THE GARDEN CLUB OF AMERICA

The Garden Club of America was founded in 1913 and has approximately 20,000 members representing roughly 200 clubs throughout the United States, including Hawaii. The Garden Clubs concentrate on only four or five issues, and leading the list are Clean Water, Clean Air and Toxics, as well as Endangered Species. We supported the original Clean Water Act, and we especially wish to commend Rep. James J. Howard on his Water Quality Renewal Act of 1983, H.R. 3282, and James L. Oberstar on his bill, H.R. 4037, which addresses the non-point source pollution problem. They have our enthusiastic support!

There are several issues that we would like to highlight as being of particular importance and concern to the Garden Clubs:

Wetlands—both tidal and non-tidal; bottomland woodland swamps and areas that may be inundated at only irregular intervals; bogs; prairie potholes; the Alaskan tundra; mudflats and wet meadows. All wetlands serve a purpose and are of tremendous ecological value. Many species can only exist under wetland conditions or through the food chain and chain of life provided by them. Many types of hardwoods, shrubs, grasses, rare plants and a variety of waterfowl, flora and fauna depend on wetlands for breeding, feeding, growing, existing. We don't begin to know the importance of all the plants in these areas and the major contribution they may be able to give to medical science and to improving strains of vegetables in future years.

Forty percent of the original wetland acreage in the lower 48 states has been destroyed.

In writing the Clean Water Act, Congress wisely recognized that our nation had a responsibility to be the trustee or steward in the management of its waters, wetlands and associated resources and environmental aspects. The states and the Federal Government should act in partnership, sharing this Public Trust and protecting these invaluable areas. Correcting mistakes is far more costly than protecting our resoruces in the first place, and, more often than not, once gone these areas and the life they sustain are lost forever. *Section 404 is vitally important and, if anything, needs stronger language so that it cannot be circumvented through Corps regulations. Especially, we must ensure that no weakening amendments are permitted.*

Many states have wetlands laws but others do not. Some of the wetland laws that exist are not properly enforced due to political pressures in the states, or they are not effective and strong enough. Some state laws apply to tidal wetlands, only, and give no protection to non-tidal wetlands, headwaters, bogs, lakes and streams. The hardwood swamps of Louisiana, the Everglades, prairie potholes, bogs and rivers in Maryland, and other areas from coast-to-coast lack protection. *It is very clear to our members that we must depend on the Federal Government to make strong laws to protect all the varieties of wetlands for the states do not do it alone.*

Nonpoint Source Pollution. Our members have worked on numerous projects to cut down on nonpoint source pollution, but volunteer efforts are not enough. Particularly in Ohio, our members have worked for green parking lots, where waters are absorbed into the ground and recharge our aquifers, instead of pollutants running off into the waterways. Throughout the country they have assisted in planting green strips in urban areas next to waterways to absorb pollutants. This has helped, but it is not enough. *Federal laws to restrict nonpoint source pollution are needed,* as this ubiquitous runoff appears to be contaminating our waters almost more than

anything else. Direct outfalls from industry and sewage treatment plants are easier to pinpoint and more controllable. Run-off from urban streets and parking lots cause major pollution problems. There is the problem of insecticides and herbicides entering the waterways from spraying along highways, from use by homeowners and from farmers. Fertilizers used on home gardens and farms, with their large amounts of nitrogen and phosphorous cause overenrichment of our waters—our reservoirs, lakes, even the Chesapeake and other bays. Our waters and aquatic grasses are being poisoned and dying from excessive phosphorous, nitrogen and other types of nonpoint source pollution. Sediment run-off keeps light from reaching the bay grasses, causing them to die, and this, in turn, reduces the population of shellfish and finfish. All these nonpoint source pollution problems have been recognized in the EPA studies and by scientists as a major cause of the degradation of the Chesapeake Bay and its depleted resources.

Rep. Oberstar's bill H.R. 4037 addresses the nonpoint source pollution problem effectively as it would: Identify stream segments where nonpoint pollution is a problem; identify the kinds of sources producing the runoff; develop the "best management practices" (BMPs) for controlling nonpoint pollution; set a time schedule for implementing the management practices as soon as possible; and identify federal programs and financial assistance which should be consistent with state nonpoint programs.

The bill provides 50 percent cost sharing with the states, and this would encourage correcting this difficult problem which must be addressed if our waters are to continue to be living resources. It is a problem which some industries and farmers and gardeners would like to ignore, but the time has come when conscious and unconscious polluters need to be served notice that Congress is serious about cleaning up contaminated run-off that is polluting our waterways.

The Cheaspeake Bay is the most productive estuary in the world, but its resources and value are slowly declining. The EPA study pointed out a number of the problems. Maryland, Virginia and Pennsylvania, and their Governors, have committed themselves to address the problems and improve the situation. The states cannot do this alone, the need Federal financial backing and a strong Clean Water Act if any success is to be achieved. Money, commitment and mandated directives to the states and the Federal natural resources agencies (the Corps, EPA, U.S. Fish & Wildlife Service and National Marine Fisheries) are a must to achieve the necessary goal of enhancing the quality of the Cheaspeake Bay.

Toxic Hot Spots.—As mentioned at the beginning, toxic are one of our major areas of concern. Strong legislative action is needed to clean up our toxic dumps and hot spots and prevent further illegal and thoughtless dumping of toxics and sludge. We question the ocean incineration of toxics because of the number of human errors that can occur in the way of spills and infractions in following regulations. These problems need to be addressed in the bill.

The current law requries industries to treat toxic wastes prior to discharging them into publicly owned sewage treatment plants. Congress must reject proposals that might weaken these provisions in the law.

The law requires industries to use the "best available technology economically achievable" (BAT) to clean up wastewater before it is discharged into our waterways. Because EPA has delayed in setting BAT standards, deadline extensions are needed, but these should not be for more than three years, and BAT standards should not be lowered.

Through regulatory changes, EPA is proposing to allow states to degrade stream water quality. These proposals should not be permitted as they would make it impossible to protect pristine waters in parks and refuges, and to achieve the goal of making our waters fishable and swimmable.

Sewage Treatment.—No untreated effluent should be permitted to enter our bays or oceans. Secondary treatment of sewage entering the ocean should be required unless the municipality has no pollutants in its sewage and the daily output is small, but even then primary treatment should be minimum. Clambeds have had to be closed and water quality thoroughly polluted by the dumping of sludge being permitted in waters off the coast—such as the 12-mile zone off New York, and the former Philadelphia dumpsite for sludge off the Delmarva Peninsula. The sludge has spread causing additional closing of clambeds. We question the proposed 106-mile dumping site as there is so much evidence that those dumping ignore regulations and dump short of the mark, or include illegal substances.

The Garden Clubs also feel the Safe Drinking Water Act H.R. 3200 (introduced by Rep. Dennis Eckhart) is a very important piece of legislation and hopes it will move forward without weakening amendments.

In closing, the Garden Club of America enthusiastically supports H.R. 3282, H.R. 4037 and H.R. 3200. If weakening amendments are proposed, they should be rejected, and we hope our concerns will be included in the final draft of the bill.

We request that our full testimony be included in the hearing record, and greatly appreciate the opportunity of addressing these issues.

We urge you to push this bill forward promptly and not delay.

Mr. ROE. Please proceed.

TESTIMONY OF A. REID JOHNSON, CLEAN WATER CHAIRMAN, NATIONAL AFFAIRS AND LEGISLATION COMMITTEE, GARDEN CLUB OF AMERICA

Mr. ROE. Mrs. Johnson, what State are you from?

Mrs. JOHNSON. I am from Maryland.

Mr. ROE. A good State to be from.

Mrs. JOHNSON. Very good State. I am glad you all were there having a tour of the Chesapeake.

I have submitted written testimony and I will give you brief excerpts from it.

The Garden Club of America was founded in 1913 and has approximately 20,000 members representing roughly 200 clubs throughout the United States, including Hawaii. The garden clubs concentrate on only four or five issues, and leading the list are clean water, clean air, and toxics, as well as endangered species. We supported the original Clean Water Act, and we especially wish to commend Representative James J. Howard on his Water Quality Renewal Act of 1983, H.R. 3282, and Representative James L. Oberstar on his bill, H.R. 4037, which addresses the nonpoint source pollution problem, which is extremely important.

We would like to highlight several issues. One, wetlands we are particularly concerned with, both tidal and nontidal, bottomland, woodland swamps and areas that may be inundated at only irregular intervals, bogs, prairie potholes, Alaska tundra, mud flats, and wet meadows. Many species can only exist under wetland conditions or through the food chain and chain of life provided by them and the various plants growing in these areas.

We don't begin to know the importance of these plants and their possible future contribution to medical science and improving strains of vegetables or in use for recombinant DNA. Forty percent of the original wetland acreage has been lost, as you know, and we are losing more at a rate of 450,000 acres a year. We are very concerned about the new corps regulations and how they are expanding their nationwide permits and granting letters of permission which remove protection from thousands of acres. We feel very strong wording is needed to be written into law to prevent the corps from circumventing the intent of the Clean Water Act and issuing regulations which remove protection from many critical and important inland areas.

For instance, bottomlands are totally removed from the new corps regulations. We are finding this difficult in many of the States. I won't go into all the examples as many are in my written testimony. The corps regulations would also remove from the States the right to object to many types of projects and they are inconsistent with many of the States' coastal zone management plans. Maryland feels this particularly.

In writing the Clean Water Act, Congress wisely recognized that our Nation had a responsibility to be the trustee or steward in the management of its waters, wetlands and associated resources and environmental aspects. The States and the Federal Government should act in partnership, sharing this public trust and protecting these invaluable areas. Correcting mistakes is far more costly than protecting our resources in the first place, and, more often than not, once gone these areas and the life they sustain are lost forever. Section 404 is vitally important and, if anything, needs stronger language so that it cannot be circumvented through corps regulations. Especially, we must insure that no weakening amendments are permitted.

Many States have wetlands laws but others do not. Many protect tidal wetlands, but the nontidal wetlands, there is no control over them at all. Maryland is one of those States, but there are many others. It is very clear to our members that we must depend on the Federal Government to make strong laws to protect all the varieties of wetlands for the States do not do it alone.

Nonpoint source pollution is extremely important. Our members have worked in a voluntary way on numerous projects to cut down on nonpoint source pollution, but volunteer efforts are not enough. Particularly in Ohio, our members have worked for green parking lots, where waters are absorbed into the ground and recharge our aquifers, instead of pollutants running off into the waterways. Throughout the country they have assisted in planting green strips in urban areas next to waterways to absorb pollutants. This has helped, but it is not enough. Federal laws to restrict nonpoint source pollution are needed, as this ubiquitous runoff appears to be contaminating our waters almost more than anything else, and we certainly are finding that in the Chesapeake Bay.

Sediment runoff keeps light from reaching the bay grasses, causing them to die, and this, in turn, reduces the population of shellfish and finfish. I think you all had a demonstration of that yesterday.

Representative Oberstar's bill, H.R. 4037, addresses the nonpoint source pollution problem effectively, as it would identify stream segments where nonpoint pollution is a problem, identify the kinds of sources producing the runoff, develop the best management practices (BMPs) for controlling nonpoint pollution, set a time schedule for implementing the management practices as soon as possible, identify Federal programs and financial assistance which should be consistent with State nonpoint programs. The time has come when conscious and unconscious polluters need to be served notice that Congress is serious about cleaning up contaminated runoff that is polluting our waterways. Adequate funding is essential to correct this problem.

The Chesapeake Bay is the most productive estuary in the world, but its resources and value are slowly declining. The EPA study pointed out a number of the problems, as was pointed out so clearly by Representative Dyson. Maryland, Virginia and Pennsylvania, and their Governors, have committed themselves to address the problems and improve the situation. The States cannot do this alone, and need Federal financial backing and a strong Clean Water Act to achieve any success. Money, commitment and man-

dated directives to the States and the Federal natural resource agencies (the corps, EPA, U.S. Fish and Wildlife Service, and National Marine Fisheries) are a must to achieve the necessary goal of enhancing the quality of the Chesapeake Bay. We see a real need for the various agencies and the States working together on this.

TOXIC HOT SPOTS

Strong legislative action is needed to clean up our toxic dumps and hot spots and prevent further illegal and thoughtless dumping of toxics and sludge. You all know of the many problems in that respect. The current law requires industries to treat toxic wastes prior to discharging them into publicly owned sewage treatment plants. These provisions in the law should not be weakened, and I think there may be efforts toward this.

Through regulatory changes, EPA is proposing to allow States to degrade stream water quality. These proposals should not be permitted as they would make it impossible to protect pristine waters in parks and refuges, and to achieve the goal of making our waters fishable and swimmable.

Clam beds have had to be closed and water quality thoroughly polluted by the dumping of sludge being permitted in waters off the coast—such as the 12-mile zone off New York, and the former Philadelphia dumpsite for sludge off the Delmarva Peninsula. We question the proposed 106-mile dumping site as there is so much evidence that those dumping ignore regulations and dump short of the mark, or include illegal substances.

In closing, the Garden Club of America enthusiastically supports H.R. 3282, H.R. 4037, and H.R. 3200. We urge you not to delay and not to have more and more hearings and delay on the point where you never get it out of committee and on the floor for a vote.

Mr. ROE. Thank you very much. The committee has not been delaying at all. The committee has been having intensive hearings because I am sure as you can appreciate in order to arrive at a consensus with 435 Members of the House and 100 Members of the Senate we have to do our work thoroughly. You wouldn't want us to close someone off from testimony until they have had the opportunity to make their presentation. That is the purpose of our forum.

Mrs. JOHNSON. Yes, well, I realize that.

Mr. ROE. Now, are there any questions? We should vote right now on your bill. I want to thank you very much for an indepth presentation. I think it is excellent. I, too, agree, particularly in the area of H.R. 4037, Jim Oberstar's presentation, because I don't think the committee has devoted enough attention, nor has the Senate, to that particular issue on the nonpoint source runoff.

We will get into that in depth.

Mrs. JOHNSON. I think it really——

Mr. ROE. It needs that kind of review.

Mrs. JOHNSON. It certainly does.

Mr. ROE. So we appreciate your testimony very much, and will give it every consideration.

Mrs. JOHNSON. Thank you very much.

Mr. ROE. Our next witness is Mr. Mark Hyner of the Connecticut Association of Metal Finishers to be introduced by Congresswoman Nancy Johnson.

Is Nancy here?

Mr. HYNER. I am afraid her plane was delayed.

Mr. ROE. And she is trying to get here. Well, on behalf of Mrs. Johnson I want to welcome you very much to the committee. I am sorry her plane is late. She is a very substantive Member of Congress. She will add to your presentation.

TESTIMONY OF MARK S. HYNER, ON BEHALF OF CONNECTICUT ASSOCIATION OF METAL FINISHERS

Mr. HYNER. Chairman Roe, distinguished members of the subcommittee, council and staff, my name is Mark S. Hyner, and I am here today representing the Connecticut Association of Metal Finishers.

On behalf of the association, I would like to take this opportunity to publicly thank Representative Johnson for her efforts on our behalf and further thank this subcommittee for its time and attention to our concerns. As background, our association has, over the past few years testified before the House of Representatives Environmental, Energy and Natural Resource Subcommittee and the Senate Subcommittee on Environmental Pollution, with respect to the Resource Conservation Recovery Act and the Federal Water Pollution Control Act, respectively. I reference this testimony only to better acquaint you with our analysis of the existing Federal environmental programs.

Our association members represent approximately 100 metal finishing companies in the State of Connecticut. The 2,000 or more people employed in the metal finishing industry in our State supply services for a broad spectrum of industries, including the aircraft, automobile, computer, and metal equipment fields. Even unsophisticated products like paperclips and pencils could not be made without our services. Our processes prevent corrosion, increase life, reduce wear and insure the operating reliability of American-made products.

Since the enactment of the Clean Water Act, Connecticut business and industry has been at the forefront of the development and implementation of waste treatment and disposal technologies, especially as related to the metal finishing and electroplating industries. During the past 10 years, the metal finishing industry in the State of Connecticut has invested millions of dollars and thousands of hours of time of highly qualified technicians and engineers to make certain that it would meet the standards established by the Clean Water Act.

Our industry has spent this money and performed these functions because we believe that the metal finishing industry, as well as all other industry, does have a public responsibility to make sure that rivers and streams are not polluted by our processes. We believe that the aims and the purposes of the Clean Water Act are proper and believe strongly that uniform standards should be established to assure that metal finishing companies in all States

adhere to these standards and thereby provide a better environment.

We are extremely proud of what we have accomplished environmentally in our State. We again have salmon in the Connecticut River. We boat, swim, and fish in rivers that 10 years ago were nothing more than open sewers. In Connecticut, we have met and continue to meet the objectives of the Clean Water Act.

While being justly proud of our accomplishments which have cost our industry millions of dollars for pollution abatement equipment and constant ongoing operating expenses associated with treatment facilities, we find ourselves in the midst of a dilemma.

We have abided by the Clean Water Act, the regulations and enforcement procedures promulgated by the act. We have not fought nor opposed State interpretations of the act. We find, however, a complete lack of uniformity in the interpretation, implementation, and enforcement of the act throughout the country. This inequality has placed us at a severe economic disadvantage. It is ironic that we, the metal finishers of Connecticut who have supported the goals and purposes of the act should now find ourselves wondering whether our competition in other States will ever achieve our levels of environmental success.

As you are well aware, our concern and dissatisfaction is not directed at this subcommittee nor H.R. 3282. To the contrary, we wish to commend the authors and sponsors of this bill for all of their efforts with respect to this product. It is our hope that the language of this bill will, to a large extent, be incorporated in the Federal Water Pollution Control Act and go far to establishing technological and enforcement parity amongst and between the States as well as the EPA regions, with respect to water quality, direct discharge, publicly owned treatment works, and pretreatment regulation. Our continuing concern with national uniformity of standards and enforcement is a direct result of being placed at a 10 to 25 percent economic disadvantage to the industry located in the States immediately surrounding Connecticut. The several specific comments and concerns which we do wish to raise are as follows:

One, while we support H.R. 3282 for its general emphasis on national uniformity, we also request that any and all revisions or additions to the act be drafted to further that national uniformity.

Two, we want to commend the proponents of this bill, the House of Representatives, and this subcommittee for not including in the bill any provision for publicly owned treatment works to opt out of the national standards. The absence or deletion of the opt-out provision goes far to allay the association's fears and concerns expressed in the Senate hearings. Namely, that a program allowing publicly owned treatment works to opt out of national standards is not politically nor economically realistic, not enforceable, and will result in minimal treatment if any, increased industrial forum shopping, and increased hazardous waste problems.

Three, with respect to section 303(c)(2) of H.R. 3282, the Association supports the proposed language which would require that certain factors be demonstrated before less restrictive uses are allowed. The Connecticut Association of Metal Finishers does, however, advocate that with respect to States wishing to improve or up-

20-955 O—84——67

grade their water quality standards, national criteria should be established which a State would be required to satisfy prior to such a revision. Absent such criteria, the program envisioned might result in greater disparity in jurisdictions and foster the unsound environmental result of forum shopping by industry.

If water quality classifications are scheduled to be upgraded, the reclassification should be accompanied by a time line so that the regulated concerns can formulate sound environmental planning decisions. An additional concern with this section of the proposal is that if the water quality classification of the receiving or downstream jurisdiction is more restrictive than the upstream jurisdiction, then the waters crossing the State lines should be subject to the more restrictive standard.

Four, with respect to section 304 and the recommendation that the Administrator establish individual control strategies for specific point source discharges of toxic pollutants which prevent or impair the attainment of a given water quality, the Connecticut Association of Metal Finishers supports this proposal. To avoid the degradation of downstream waters and/or the resultant environmental forum shopping, the association does, however, recommend that H.R. 3282 be revised to provide interstate standards as well as a mechanism for enforcement.

For the foregoing reasons, we support H.R. 3282 as amended by our comments. Our association appreciates your attention and hopes that you will incorporate our comments concerning the uniformity of water quality, pretreatment and enforcement standards. Most importantly, we urge you to pass this legislation this session.

On behalf of the association, I again want to thank you and Representative Johnson for this opportunity to appear and present testimony.

Mr. ROE. Thank you very much for a very concise, clear presentation. Does anyone have any specific questions?

The gentleman from Minnesota?

Mr. STANGELAND. Thank you, Mr. Chairman.

You indicate support for uniform standards to assure that metal-finishing companies in all States are subject to the same requirements. It is my understanding that the effluent guideline regulations for the metal finishing industry have been promulgated. Is that correct?

Mr. HYNER. They have been, and if they are enforced uniformly and they meet, I guess it is the April 1984, we would be satisfied. It has been a history of 10 years for us of having these standards promulgated, fought off, promulgated and fought off, and they are still not in place in many, many States.

Mr. STANGELAND. I gather the Connecticut metal finishers are satisfied with those standards?

Mr. HYNER. We have no problem with them.

Mr. STANGELAND. Are there differences between those standards and those throughout the country?

Mr. HYNER. There sure is. We used to be part of the National Association of Metal Finishers. Approximately a 1½ or 2 years ago we withdrew from the national over this very issue. We felt their tactics were delaying and serving no purpose.

Mr. STANGELAND. Could you give us the view of the national group?

Mr. HYNER. I think the national feels the standards are too strict and too costly. We disagree.

Mr. STANGELAND. You also mention on pages 3 and 4 that current implementation of the Clean Water Act requirements lacks uniformity and has placed the Connecticut metal finishers at serious economic disadvantage. How has this economic disadvantage been created, and why aren't all metal finishers near the State of Connecticut or throughout the Nation not subject to the same standards?

Mr. HYNER. Because region I has the same standards we are talking about in the testimony. The States of Vermont and Connecticut have chosen to formulate their own Clean Water Act. Connecticut did this, I believe, in 1969, so from the early 1970's all the metal finishers in Connecticut have been treating their water.

Rhode Island, for example, has not chosen to do that and metal finishers in Rhode Island still are not treating their water with a couple exceptions.

Mr. STANGELAND. Is that because Connecticut and Vermont chose higher standards?

Mr. HYNER. Connecticut does have higher standards than the proposed Federal standards but chose to enforce them and start their own program. In the case of Rhode Island, Region I EPA has just chosen not to enforce that because these regulations have not been fully promulgated or accepted. As it stands now, I believe it is April 1984 that these have now been settled, I hope.

Mr. STANGELAND. The regulations will have been formulated by April 1984?

Mr. HYNER. I think that is the date they are suppose to go in place. I am not certain. It keeps changing.

Mr. STANGELAND. You also suggest that this committee should not support any amendment to the Clean Water Act which provides for publicly owned treatment works to opt out of the national standards. There has been much discussion about the possibility of creating a pretreatment equivalency or opt-out opportunity in the act. I assume this is what you are referring to.

If the POTW can demonstrate that the locally imposed pretreatment program is at least as environmentally protective as one that would be required under uniform national standards, why shouldn't that POTW be allowed to operate under its own system?

Mr. HYNER. We addressed that specifically in the Senate testimony. But to go over it briefly, we don't feel that the control on a day-to-day basis can be exercised by a POTW. We feel the vast majority of them are set up to treat household and human waste. They are not set up to treat industrial waste. We are equipped to treat what we deal with. We don't feel they are. They can't handle specific discharges. They have trouble if there is an overflow situation.

We feel that, and this has been the subject of discussions with the Connecticut EPA which has worked with us on this testimony, that the technology at POTW's just is not built for handling industrial waste, and it is better to treat it there.

Second, what metals, for example, from our industry do come out into the sludge then contaminates the sludge from the POTW

which if uncontaminated can be used for fertilizer or can be incinerated. If you contaminate it with metals, you have contaminated a huge amount of waste under RCRA.

Mr. STANGELAND. I guess the question is if the pretreatment is proven cost effective and also environmentally protective, then you wouldn't oppose the opt out. And a POTW couldn't opt out if they couldn't prove that.

Mr. HYNER. Well, there would have to be some considerable proof I guess for me to accept it, because I just don't believe that that would be a long run—we have problems with our own systems on a day-to-day basis. I would hate to see what would happen as we put stuff into a POTW.

Mr. MOODY. You have said the fact you have gone ahead and invested this money puts you at an economic disadvantage with your competitors in other States that haven't done so?

Mr. HYNER. Yes, sir.

Mr. MOODY. Thank you.

Mr. ROE. You know I think you are making a good point which I would just like to kind of close on this note. We have been fighting since 1972, and I am afraid unsuccessfully, to have the combined sewer issue, are you familiar with that issue?

Mr. HYNER. Somewhat.

Mr. ROE. Of that as an integral part of the system. And constantly and constantly and constantly between the Senate and administration. Not this administration, all the administrations. They have written that off and said we can't afford to do that.

You are coming back and saying one of two things. If we don't do the pretreatment as we are doing as you handle it now, removing any of these toxic materials, and others, before it gets to the main sewage disposal plant, then we are simply contaminating the sludge from the sewage disposal plant which has another problem, to take care of it, is that correct?

Mr. HYNER. That is exactly it.

Mr. ROE. It literally astounds me why these people can't understand that in the Senate particularly, because in the Northeast, particularly in the State of New Jersey, and also in Boston and other areas in Massachusetts, they still have the combined sewer situation. So that immediately when we have any major storms, major runoffs, it scours out all the material and puts it right back into the river. So basically what you are saying, if the Federal Government opts out not to be concerned about correcting the combined sewer issue, separating those sewers, then it almost mandates you to do something to treat those heavy metals or whatever in the plating industry before it gets into the sewer system because it will never even get to the sewage disposal plant where they have those combined sewers. Is that correct?

Mr. HYNER. You are absolutely correct.

Mr. ROE. Could you talk to your people in Connecticut, Vermont, and Rhode Island on that very issue in the Senate? It would be so helpful.

Mr. HYNER. I have appointments with both of them this afternoon.

Mr. ROE. Please make that point. I say this as a citizen technically trained, it is a tragedy. I hate to see the American people had, or

being told something that isn't true. We are never going to clean up those rivers in the Northeast and those bays until we correct that combined sewer program, because it is flying in the face of everything we are talking about on these standards.

Mr. DAUB. Will the chairman yield?

Mr. ROE. Yes, of course.

Mr. DAUB. It is not just true of the Northeast. I served on the Environmental Control Board in the State of Nebraska for 2 years with some familiarity with RCRA and sludge management. We can do all the farm and feedlot sludge management program we want, but if on the borders of cities where we are not doing the right things with industrial waste problems, tool and diemakers, and other kinds of light and medium industry, we end up with the same problem. We didn't solve it.

I do think we need to work on it. I think pretreatment opt-outs are not to be rejected out of hand, however. I think you should take a look at the opportunity from a Federal point of view of just being sure that the pretreatment plan is tested, workable, and operative. There may be circumstances where they are useful.

So I didn't want you to miss the point of the dialog a minute ago, that they may be all right if in fact they are just not a piece of paper that you know is approved by somebody and then, here, go do it. That in fact if that is not in place and with best available technology is not going to function to be the standard as required by RCRA, then I don't think the opt out should be allowed.

But I do think they should not be discarded simply because they, as a policy option, might not be administered correctly.

Mr. HYNER. May I make a point?

Mr. ROE. Of course.

Mr. HYNER. Part of our approach is that we do not wish to see treatment by dilution. One of the things that at least the State DEP has said to us is that that is frequently what happens. If you have to meet a standard of one part per million of nickel, if that happens to be the standard that is established on a river or through the EPA standards, if it gets into a system that dilutes it down from 10 parts per million to 1 part per million without effectively removing the metal, at the end of the pipe that metal is still there.

Mr. DAUB. I just don't want you to prejudge what kind of treatment might be suitable or appropriate on that basis. That is the point.

I thank the gentleman for yielding. I want to cooperate with him on working on this combined treatment idea because we are really not going to, in cities and border farm communities, solve a lot of problems if we don't have a combined attitude about how we interrelate the two processes.

Mr. ROE. Mrs. Johnson made a good point. You also closed your testimony and came back and said to get something done—and we want to, too. We wrote the first part of this bill in 1972. This very same committee, many of the people on this committee. We have lived with this interpretation, if you like, and to try to get the thing done to achieve the goals. What exasperates us is we know what we are trying to write into law and we know what we are trying to achieve, but when we get to the regulatory end of

it and other people interpreting what Congress means, it comes out just the opposite. That is what our concern is.

I think what the gentleman is saying is that we have to have some kind of flexibility. But we also have to educate Members of Congress and the administration, whatever the administration may be, to understand that we are dealing with the whole. We are not dealing with a part.

Yesterday, in discussion with representatives from those four States I tried to point out one very important thing to them. I said what we do in clean water is important. What we do in the water resources development bill, which is the construction bill, hydropower, water transportation, that is important. What we do in the Superfund, RCRA bill is critical but they are all one and the same.

If we have one set of regulations fighting one another, even from EPA, regulations counter each other. Just keep that in the back of your mind when you are talking to your senatorial representatives. We could use help on the Senate side.

Mr. HYNER. We will do that.

Mr. ROE. If there are no further questions from the gentleman, we want to thank you for being with us this morning. We certainly will give the greatest attention to all the testimony this morning.

The committee will recess until tomorrow morning. We will reconvene in room 2167 tomorrow for continuation of our hearing.

Committee stands recessed. For the members benefit, the hearings will start at 9:30 tomorrow morning.

[Whereupon, at 11:15 a.m., the subcommittee recessed, to reconvene at 9:30 a.m., Wednesday, October 19, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, OCTOBER 19, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to recess, at 9:40 a.m., in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen. We will continue today with our hearings of yesterday on the clean water bill.

We have with us this morning Mr. John Siegmund, who is representing the Environmental Affairs Committee of the American Society of Mechanical Engineers.

We want to welcome you, Mr. Siegmund.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF THE ENVIRONMENTAL AFFAIRS COMMITTEE

Mr. Chairman, members of the subcommittee, I am John W. Siegmund, a member of the Environmental Affairs Committee of the American Society of Mechanical Engineers, and a partner in the environmental consulting firm of Sheppard T. Powell Associates, Baltimore, Maryland.

On behalf of the ASME committee, I am pleased to have this opportunity to express our views on effluent standards, treatment of toxic pollutants, wastewater pretreatment standards, and groundwater protection under the Federal Water Pollution Control Act.

The American Society of Mechanical Engineers is a technical and educational organization with a membership of 107,000. It has nearly 180 Sections throughout the nation and members with diverse technical interests as represented by ASME's 32 technical divisions. The Society conducts one of the world's largest technical publishing operations, including technical papers, books, codes and standards.

This statement was prepared by the Environmental Affairs Committee of ASME. It represents the considered judgment of this committee, a group of engineers with expertise in the field, rather than an official position of ASME.

EFFLUENT LIMITATIONS

The establishment of BAT effluent standards and enforcement of Public Law 92-500 and Public Law 95-12 will result in almost all major industries with direct discharges to the nation's streams reducing their discharge of pollutants to practical minimums.

The largest polluters of our streams today are (1) municipalities which either have not constructed facilities or properly operated them to adequately treat their wastewater; and (2) nonpoint sources. The adoption of discharge parameters beyond secondary treatment, without consideration of stream self purification capabilities for conventional pollutants, in some instances has resulted in the expenditure of un-

necessary Federal and local funds, as well as the design and construction of facilities too sophisticated to be operated and maintained by personnel who have not had equally sophisticated training.

Therefore, the Committee believes the Clean Water Act should be amended to permit a usage of both stream and effluent standards for conventional pollutants. This, existing effluent standards should remain intact and new more rigid standards required whenever warranted by local water quality conditions.

The adoption of further discharge parameters and BCT requirements without consideration of stream self-purification capabilities for conventional pollutants may result in the waste of resources. Under the previous provisions of Public Law 92-500, all streams in the U.S. have been classified as to usage. Using stream standards as a basis for permitting, reasonable treatment without stream degradation could be provided.

With the significant strides made in cleaning up the industrial discharges to the nation's streams, it is believed that the use of stream standards for conventional polluants offers an opportunity to assess benefits versus costs. Under the current law the importance of stream classifications has been minimized, since all major industry discharges must at least meet BCT levels. The only time stream classifications achieve a degree of importance is when BCT discharges will result in stream degradation, and then stream quality control provisions of the regulations must be brought into play. By initiation of stream standards, attention will be focused on stream classifications and opportunities will be presented to review and possibly reclassify, up or down, streams which have been misclassified in the past.

Water Quality Standards for conventional pollutants will allow the nation to husband its resources for expenditure where the cost/benefit ratio can be more attractive and serve a greater number of people. By utilizing the stream classifications under a water quality standards program, industries, states, and municipalities would not be required to expend funds for BCT or secondary treatment unless the additional expenditure would result in a consequential improvement of the stream.

We must recognize that due to differences in geographical, geological, topographical, and climatic conditions, the same standards cannot be met in all parts of the U.S. The quality of the nation's streams before man made pollution, was dictated by natural conditions in the individual watersheds and streams themselves. A stream's self-purification capabilities are a good example of nature working to solve its problems. Recognizing that it is always difficult and many times impossible to improve on nature, we are happy to see the EPA recognizing a stream's self-purification capabilities in allowing it to return to its natural state.

TOXIC POLLUTANTS

By proposing Water Quality Standards, the EPA has acknowledged the points raised, but may have taken the regulations a step further than is prudent at this time. The effluent limitations on toxic substances must remain in place and not be waived or relaxed.

We have suggested, that over a period of time a workable water quality based approach can be implemented for toxic substances, but in our opinion that time has not yet come. At the present time, the only effects of toxic pollutants on streams that can be predicted with any degree of certainty are the dilution ratios. In many cases it is impossible to measure the levels of toxic pollutants in our streams accurately enough to be of any value. The information needed to develop toxic pollutant water quality standards which would ensure the continued improvement of our waterways is not now available.

Therefore, before such standards can be implemented properly, the EPA must do the necessary research. We recommend that the EPA begin a well funded research program on toxic pollutants which will increase the knowledge of these pollutants to the level we now have on conventional pollutants.

The EPA must develop techniques to predict the fate and effects of the toxic pollutants under a variety of conditions using mathematical modeling based on instream testing. Once this research is completed and proven the EPA should develop Water Quality Standards for toxic pollutants. But to do so before the research is completed would undermine the efforts of the past ten years to control toxic pollutants.

Until this is done, every effort to use available technology should be made to minimize the discharge of toxic pollutant into waterways. At this time, we believe EPA must promulgate BAT for particular toxic pollutants, and dischargers of those pollutants should have three years to develop the appropriate technology and build the necessary facilities to comply.

We believe an effective approach for the return to Water Quality Standards must involve four steps:

(1) The effluent guidelines already developed for conventional pollutants should remain intact and put into effect;

(2) Water Quality Standards should be used to develop permits for those industries for which effluent guidelines have not been developed and those areas where effluent guidelines have not been nor are expected to be sufficient;

(3) The EPA should begin immediately a long-term research program on the effects of toxic pollutants on water quality and the aquatic environment, and to determine the appropriate relation to standard setting; and

(4) When the research is completed and proven, the EPA should promulgate Water Quality Criteria for toxic pollutants.

The Act should be amended to allow for greater use of the "innovative" classification which permits extension of the compliance dates. For example, if a facility subject to permit under section 402 of the Act proposes to comply with the requirements of section 301 by replacing existing production capacity with:

A. An innovative production process which will result in effluent reduction significantly greater than that required to meet stream standards. This would be a move toward the national goal of minimizing the discharge of all pollutants;

B. The installation of an innovative control technique that has been demonstrated on a small scale and has been held by peer review to have a substantial likelihood for achieving a significantly greater effluent reduction than required;

C. A process that achieves the required discharge reduction with an innovative system that has a potential for significantly lower costs than systems commonly in use and has the additional potential for industry-wide application;

Then that facility should be granted an extended compliance date to July 1, 1987. This should only be allowed, however, if actual experimental data are developed and/or the process has the potential for industry-wide application as determined by peer review.

In addition, we believe the term "no discharge" should be replaced with the term "standard of performance." "No discharge" has proven to be impractical in most cases. The term "standard of performance" would be defined as the standard for control of effluent reduction which the Administrator determines to be achieveable through application of the best available demonstrated technology, processes, operating methods, or other alternatives.

PRETREATMENT

EPA has been proposing pretreatment standards for Significant Industrial Users (SIUs) to Publicly Owned Treatment Works (POTWs) for at least the past six years without actually promulgating any standards. States are required to have Pretreatment Standards programs to obtain Primacy, and municipalities must agree to set up and enforce pretreatment standards to be eligible for the Construction Grants Programs. However, EPA has yet to promulgate definitive standards even though in many cases standards for discharge to POTWs were included in the Effluent Guidlines proposed.

It is difficult to understand how states and municipalities can be expected to develop acceptable standards when EPA itself is having difficulty making these decisions. Since most POTWs have been built under the Construction Grants Program and have utilized Federal funds, EPA should be mandated to take a position on pretreatment standards. The agency should either promulgate standards for SIUs or require the states to adopt standards without EPA oversight so this part of the program may proceed expeditiously.

GROUNDWATER PROTECTION

EPA and the states already have sufficient groundwater protection authority. Therefore, the problem does not presently warrant new legislation, but rather implementation and enforcement of existing authority. Because of the myriad of laws concerning quality of water—both ground and surface—coordination and consolidation of such laws are needed.

This concludes the statement, Mr. Chairman. Thank you again for the opportunity to participate in this hearing, and I would be pleased to answer any questions you or the Subcommittee Members may have.

Mr. ROE. Please proceed.

TESTIMONY OF JOHN W. SIEGMUND, MEMBER, ENVIRONMENTAL AFFAIRS COMMITTEE, AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Mr. SIEGMUND. Thank you.

Mr. ROE. We have your testimony but you go right ahead and proceed.

Mr. SIEGMUND. Mr. Chairman and members of the subcommittee, I am John W. Siegmund, a member of the Environmental Affairs Committee of the American Society of Mechanical Engineers, and a partner in the environmental consulting firm of Sheppard T. Powell Associates, Baltimore——

Mr. ROE. Of Baltimore?

Mr. SIEGMUND. Yes, sir.

Mr. ROE. Something very important happened there recently didn't it?

Mr. SIEGMUND. Yes, sir. Stick with those Orioles.

On behalf of the ASME committee, I am pleased to have this opportunity to express our views on effluent standards, treatment of toxic pollutants, wastewater pretreatment standards, and ground water protection under the Federal Water Pollution Control Act.

The American Society of Mechanical Engineers is a technical and educational organization with a membership of 107,000. It has nearly 180 sections throughout the Nation and members with diverse technical interests as represented by ASME's 32 technical divisions. The society conducts one of the world's largest technical publishing operations, including technical papers, books, codes, and standards.

This statement was prepared by the Environmental Affairs Committee of ASME. It represents the considered judgment of this committee, a group of engineers with expertise in the field, rather than an official position of ASME. The full text of our statement has been submitted to the subcommittee, and I will summarize its contents.

ASME's Environmental Affairs Committee believes the Clean Water Act should be amended to permit usage of stream and effluent standards for conventional pollutants. Existing effluent standards should remain intact, and new more rigid standards adopted wherever warranted by local water quality conditions. Adoption of further discharge parameters and best conventional treatment requirements without consideration of stream self-purification capabilities for conventional pollutants may result in a waste of resources.

It is believed that the use of stream standards for conventional pollutants offers an opportunity to assess benefits of effluents treatment versus costs. Under current law, the importance of stream classifications has been minimized, since all major industrial discharges must meet best conventional treatment levels.

In regard to toxic substances, the committee believes effluent limitations on toxic substances now in effect must remain in place, and not waived or relaxed. However, information needed to develop water quality standards for toxic pollutants which would insure the continued improvement of our waterways is not now available.

In many cases it is impossible to measure the levels of toxic pollutants in our streams accurately enough to be of any value. Before water quality standards for toxic pollutants can be implemented properly, EPA must begin a well-funded research program on toxic pollutants to a level we now have on conventional pollutants. Until then every effort should be made to use available technology to minimize the discharge of toxic pollutants into waterways. We believe EPA must promulgate best available treatment for particular toxic pollutants and dischargers of these pollutants should have not less than 3 years to develop the appropriate technology and build facilities to comply.

Another part of the act we believe needs to be examined involves innovative technology. The act should be amended to allow for greater use of the innovative classification which permits extension of the compliance dates. For example, when a facility subject to permit under section 402 of the act proposes to comply with the requirements of section 301 by replacing existing production capacity with an innovative production process will result in effluent reduction significantly greater than required to meet stream standards, then this facility should be granted an extended compliance date to July 1, 1987.

In addition we believe the term "no discharge" should be replaced with the term "standard of performance." No discharge has proven to be impractical in many cases. The term "standard of performance" should be defined as the standard for control of effluent reduction which the Administrator determines to be achievable through application of the best available demonstrated technology, processes, operating methods, or other alternatives.

A serious problem, particularly in the case of small understaffed publicly operated treatment works concerns pretreatment of wastes they receive. EPA has been proposing treatment standards for significant industrial users [SIU's] to publicly owned treatment works [POTW's] for at least the past 6 years without actually promulgating any standards. States are required to have pretreatment standards programs to obtain primacy, and municipalities must agree to set up and enforce pretreatment standards to be eligible for the construction grants programs. However, EPA has yet to promulgate definitive standards even though in many cases standards for discharge to POTW's were included in the effluent guidelines proposed.

Since most publicly owned treatment works have been built under the construction grants program and have utilized Federal funds, EPA should be mandated to take a position on pretreatment standards for significant industrial users, or require States to adopt standards without EPA oversight so this part of the program may proceed expeditiously.

EPA and the States have sufficient ground water protection authority. New legislation is not warranted, but implementation and enforcement of existing authority is needed.

This concludes our statement, Mr. Chairman. Thank you again for the opportunity to participate in this hearing, and I would be pleased to answer any questions you or the subcommittee members may have.

Mr. ROE. We thank you very much for your testimony.

Are there any questions? Mr. Hammerschmidt?

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman.

Mr. Siegmund, on page 2 of your statement, in discussing the need for increased use of stream standards for conventional pollutants, you mention that "in some instances this has resulted in expenditure of unnecessary funds as well as a design and construction of facilities that are too sophisticated."

On a percentage basis could you estimate the extent to which this situation is occurring?

Mr. SIEGMUND. No, sir, I don't think I can give you a percentage figure on that.

Mr. HAMMERSCHMIDT. On page 3 you mention streams which have been misclassified in the past. To what extent nationwide has there been a problem with misclassification of streams? Why have these misclassifications occurred?

Mr. SIEGMUND. Do you say misclassifications?

Mr. HAMMERSCHMIDT. Yes. Of streams.

Mr. SIEGMUND. Well, some streams I feel, this is my own personal view because I am not expressing the view of the committee, in some cases a stream's capability of handling effluents has been overlooked. And I don't think enough study has been given to all the streams to really classify how much of a waste load they can or cannot handle. In so many cases streams are looked at with a view that they should be 100 percent cleaned up. Well, experience has shown us that a stream can assimilate wastes, and do so without creating a block across the stream to prevent fish life from living nomally in the stream.

Mr. HAMMERSCHMIDT. Well, of course, this is a fairly important issue.

Mr. SIEGMUND. Certainly.

Mr. HAMMERSCHMIDT. About the classification or misclassification of streams. I wonder if you could supply, if not today, perhaps for the record, as many specific examples as possible of streams that illustrate the problem.

Mr. SIEGMUND. I think I can provide you with an illustration along this line.

Mr. HAMMERSCHMIDT. I think the more comprehensive you could make that, the more helpful it would be to the committee.

[The information requested had not been received by the Subcommittee at time of publishing.]

Mr. HAMMERSCHMIDT. I just have one more question, Mr. Chairman.

On page 3 and 4 you take the position that effluent limitations for toxic substances should not be waived or relaxed because we do not currently have the information needed to make proper waiver decisions. You suggest EPA embark on a significant research effort in this area.

What estimates can you provide the committee in terms of the necessary funding level, length of time and program design for such a research effort?

Mr. SIEGMUND. You have caught me again on this one for specifics. I can take this back to our committee and come up with an answer for you I believe.

Mr. HAMMERSCHMIDT. If you would supply that also for the record, it would be most helpful.

Mr. SIEGMUND. Yes, sir.

[The information requested had not been received by the subcommittee at time of publishing.]

Mr. HAMMERSCHMIDT. Thank you for your testimony, Mr. Siegmund.

Mr. SIEGMUND. Thank you.

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

Mr. Hammerschmidt touched somewhat on my question. You say that EPA must do necessary research and develop standards. How far do you feel EPA needs to go in developing techniques? Also, do you feel that most of this should be done by government? Or how should industry be involved in developing techniques and standards?

Mr. SIEGMUND. Well, industry does have a good bit of information on handling their own toxic wastes. This information should be used to the fullest but the Government I guess is the best group to research some of the problems we have with some of these toxic wastes.

Money would have to be spent, obviously. One of the problems that we have, or I have as an individual working in the field occasionally are using methods for measuring toxic wastes, first of all. This is why we put that statement in there about measurement. Some of the analytical techniques are far from being what they should be to tell us what is actually there.

I think we need to move in that direction first, to know what we have. And then also to proceed with the necessary treatment that would remove these wastes.

Mr. ROWLAND. Do you feel an adversary relationship exists between EPA and industry?

Mr. SIEGMUND. At the moment I don't feel that tension that I used to feel. I think there is more cooperation today than there has been before.

Mr. ROWLAND. Thank you. Thank you, Mr. Chairman.

Mr. ROE. Fine. Are there any further questions?

Mr. Siegmund, we want to thank you very much, and we look forward to your response to the questions of Mr. Hammerschmidt and others. We appreciate that. Thank you very much for being with us this morning.

Our next witness is Mr. Kermit L. Prime, who represents the National Society of Professional Engineers.

I want to welcome Mr. Prime to our hearing. If you would identify for the record your associate, we would appreciate that.

TESTIMONY OF KERMIT L. PRIME, P.E., CHAIRMAN, NSPE'S LEGISLATIVE AND GOVERNMENT AFFAIRS COMMITTEE, NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS, ACCOMPANIED BY BILL FOGARTY, ASSISTANT DIRECTOR, LEGISLATIVE STAFF

Mr. PRIME. Thank you. The gentleman to my left is Bill Fogarty, Assistant Director of the Legislative Staff of the National Society of Professional Engineers.

Mr. ROE. Mr. Fogarty.

OK. We have your testimony, if you will go ahead and proceed.

Mr. PRIME. Mr. Roe, there have been some slight modifications to the testimony sent to the staff on Monday. The current testimony was given to the clerk this morning. I will do what you choose. I can read the current testimony or summarize.

Mr. ROE. Go ahead and read the testimony. I think it is good.

Mr. PRIME. Thank you, sir.

Mr. Chairman, I appreciate having this opportunity to appear before the subcommittee today on behalf of the National Society of Professional Engineers to discuss the reauthorization of the Federal Water Pollution Control Act. My name is Kermit L. Prime, P.E., and I am chairman of NSPE's Legislative and Government Affairs Committee and a principal engineer with the Boyle Engineering Corp. in Orlando, Fla.

With a membership of approximately 80,000 individuals from every field of the engineering profession and every State in the Union, one of NSPE's primary missions is to serve the public by offering viewpoints on matters of public policy in which engineering background and expertise are pertinent. The Nation's clean water programs certainly fall into this category, and because of the diversity of our membership, we view these efforts from several perspectives.

Our members in private practice and local government recognize the need for Federal assistance in meeting national water quality goals and see the benefits to their communities in upgrading water treatment. However, we are also frustrated by the requirements of the grants program, which are both complicated and subject to frequent change. Engineers in State government and those employed by the U.S. Environmental Protection Agency face the difficulty of translating national objectives into programs which are workable on the local level. Finally, our members in industry have been caught in the debate over pretreatment and the extent to which publicly owned treatment works can be utilized to treat industrial effluents. Therefore, our members have witnessed the successes and failures of the Federal Water Pollution Control Act from diverse points of view.

One of our overriding concerns is the need to bring stability to these programs. Over the years the one major contributor to confusion, antagonism and, in some cases, unsatisfactory results has been the fact that all the players have been shooting at a moving target—a law with attendant rules and regulations, all of which have been subject to change with an unusual degree of rapidity. Therefore, if we make no other point here, we at least hope to stress our support for a minimum of change in the law. While we recognize that some beneficial revisions can and should be made at this time, we hope that the subcommitte will approach any major changes with a large measure of caution.

Having made this very general point, I will reference my specific comments to H.R. 3282, the "Water Quality Renewal Act of 1983," although it is my understanding that the subcommittee has not yet determined what will be the actual vehicle for markup.

First, with respect to funding for sewage treatment plant construction. Mr. Chairman, NSPE opposes the increases in funding

provided under H.R. 3282 for the sewage treatment construction grants program in fiscal years 1984 through 1988. We support funding levels of $2.4 billion per year, consistent with the Omnibus Budget Reconciliation Act of 1981.

Mr. ROE. If I can stop you there. You have made very profound statements already. Tell me why you say that.

Mr. PRIME. Again, that is consistent with our observations that the law and regulations relating to the construction grants program has changed so dramatically. Furthermore, the uncertainty with respect to the future of Federal funding puts many grantees or local political subdivisions in the position of uncertainty with respect to action that they should take. Should we wait a couple more years and see what is going to happen, if the Feds are going to generate more money? Or should we proceed today with our own projects and our own funding?

Mr. ROE. What puzzles me by that statement is, first of all, I agree with what you have said so far. I think you have made an excellent opening statement. Having said that, one comes back and says we already know that there are projects stopped all over this country that have been segmentalized under this and previous administrations, only part and pieces completed.

Don't you think we ought to go ahead and finish those?

Mr. PRIME. Yes, sir. I think in the next paragraph we give our position with respect to completing projects and offer alternative suggestions for funding the remaining projects that aren't——

Mr. ROE. Then I better wait until you have finished. Go ahead.

Mr. PRIME. Yes, sir. Again we advocate continuing that annual level of grant assistance until those projects currently approved for funding on the various States' priority lists are funded. So, this, Mr. Chairman, addresses the segmented projects you were referring to I believe.

Mr. ROE. What puzzles me, I know what has happened in my own State. It is a function of whether we have enough money to get the job done. In effect, with the lack of funding or minimal funding we are falling behind in every area in that State. We can't raise enough money to do it locally.

Mr. PRIME. Let me reemphasize, the point is maintain the $2.4 billion funding level to complete those projects which are on the fundable portion of the State priority list currently, not the planning portion. What we are saying is those projects that have been assured they would receive funds, have planned for, have gone through the redtape necessary to be eligible for grant funding——

Mr. ROE. It just doesn't work that way. That is what I am trying to say to you. It just doesn't work that way. I have to speak to my own State at the moment. I shouldn't be interrupting your testimony, and I am not suggesting that you are wrong. I am simply saying we know the program in New Jersey will be set back 10 years at the rate we are funding it now. No question about it.

Shouldn't the engineers be in a position of saying we ought to be able to accept that? But I shouldn't interrupt. Go ahead.

Mr. PRIME. I would like to be sure I am making myself clear. The things we are talking about funding are the ones that are currently on the fundable portion of the priority list, not the ones that are on the planning portion, which I think is where you will find the ma-

jority of these projects that would take 10 years to complete lie. With respect to those, we offer an alternative method of solving the problem.

Even though the short-term economic interest of engineers might be better served by a larger grants program which stimulates more POTW construction, we are convinced that the $2.4 billion annual cap is more appropriate. Not only will the doubling of the size of the grants program by fiscal 1986 exacerbate the Federal Government's severe budgetary problems, such an action also would continue the pattern of widely fluctuating funding levels which have undermined the program's stability in the past.

It also would impose an additional administrative burden on Federal and State agencies which already are overburdened. Furthermore, State and local officials cannot possibly be expected to formulate realistic plans for meeting wastewater treatment needs under these conditions. On one hand, they cannot accurately gauge their chances for receiving grant assistance because the national government has not maintained a consistent level of funding. On the other hand, proposals for sharp increases in funding cause those officials to be reluctant to undertake projects utilizing their local resources in view of potential Federal assistance. If we truly hope to encourage the States and localities to shoulder more responsibility in providing wastewater treatment, then the grants program funding must be stabilized at current levels, and clearly identify those which will receive funds.

Discussions with engineering firms around the country have revealed that many communities which should upgrade their facilities and could finance the work from local resources are delaying this work in hopes of achieving Federal grant assistance. Even in communities where the potential for receiving such aid is extremely low, local officials are reluctant to commit money as long as the possibility of grant assistance exists at all.

Unfortunately, proposals to substantially increase this funding encourage such attitudes, even though doubling the size of the program would still leave many eligible communities on waiting lists for many years. We just might see more progress on sewage treatment facility construction if local leaders knew that grant assistance will not be forthcoming in many instances, and that they must arrange their own financing for such projects.

We recognize that some communities will not be able to finance needed work from local resources. In such cases, we recommend a greater reliance on mechanisms such as low interest loans and privatization as alternatives to a grants program for those projects not currently on the fundable portion of State priority lists in this fiscal year.

Looking specifically at loans, we believe that this particular mechanism has important advantages over the adoption of a greater emphasis on grants. First, funds provided for loans can benefit a larger number of projects when compared to the same amounts awarded as grants. This is especially true when the loans are provided through revolving funds which allow the repaid loans to be reinvested in additional projects. Proposals to this effect have been introduced in both the House and Senate, although the revolving

funds generally have not been confined to wastewater treatment plants.

Second, in many cases, low interest loans can be substituted for grants without placing unreasonable economic burdens on communities. Our professional engineers in private practice division has conducted an analysis of financing packages using different combinations of grants and low-interest loans for communities of under 25,000, and estimated the impacts of various options on rates paid by individual households. They assumed that the loans would be repaid with a 5-percent interest rate over 40 years. A copy of this study is provided. [See page 1073.]

Our private practice engineers found that a greater emphasis on loans, while causing the rates paid by the individual households to rise somewhat, did not result in major rate increases. For example, one section of this study took a hypothetical community with a population of 6,250, and looked at the impacts on rates of different financing packages. For secondary treatment and the funding alternatives analyzed, the lowest rates per household were achieved by the use of a combination of a grant covering 55 percent of project costs with a subsidized loan funding the remainder of the project. A grant covering 75 percent of the project cost with no loan component produced slightly higher rates. A loan covering all project costs raised rates by approximately $55 per year over the lowest option.

Perhaps most significantly, a low-interest loan covering 100 percent of project costs raised the average household rate by only about $53 per year—or less than $4.50 per month—when compared to a grant covering 75 percent of costs.

Third, we believe that the Federal and State imposed factors which delay grant-funded programs will be minimized with a loan program. Recent analyses indicated that it takes an average of 8 to 9 years to implement a grant-funded wastewater treatment project. These delays actually serve to increase costs and should be avoided through a loan program.

Finally, we feel that a greater dependence on loans will result in a more realistic assessment of needs by the States and greater State and local responsibility for those projects. Some States and localities may maximize their needs assessments to improve their prospects for attaining grants. However, since loans must be repaid, there is less incentive to inflate State needs assessments.

The Farmers Home Administration's loan program for wastewater treatment could be viewed as a precedent for this general type of program. We believe that agency's efforts have worked well in many respects.

For these reasons, Mr. Chairman, we urge the subcommittee to consider the utilization of alternative financing mechanisms such as subsidized loans in place of a larger grants program. While we recognize that the higher grant funding levels in H.R. 3282 represent a well-founded concern over the need for more Federal support for improvement of local treatment capabilities, we strongly believe that such assistance can be provided in a more cost-effective way through loans. We further advocate that such loan programs be administered by the States to the greatest extent possible.

20-955 O—84——68

Let us now speak to the extension of the BAT and BCT deadlines. H.R. 3282 calls for the extension of the deadlines relating to the achievement of best available technology and best conventional technology standards by POTW's. We reluctantly support these extensions. This will not be the first time the deadlines have been postponed, however, and the credibility of any deadline becomes suspect with its continued extension. The agency has had a full decade to develop a workable program to meet the act's goals, and if the new timetables provided under H.R. 3282 are adopted, they should be implemented without additional delay. If the agency again fails to meet the new deadlines, Congress should place the burden on agency officials to explain why the timetables could not be met and to propose alternative, achievable schedules.

Let us now speak to ocean discharge waivers. We have several reservations regarding section 301(h), dealing with ocean discharge waivers. This provision of H.R. 3282 would exclude almost all applications for waivers of secondary treatment for discharge into estuarine areas. However, current regulations have extremely rigorous requirements to show that no degradation is occurring because of discharges. If these requirements are met, it should not matter if the discharge is in the estuary or the ocean.

Also, the POTW's which have been complying with the waiver requirements since 1979 have spent tremendous sums of money to do so. To change the rules now would mean that this money was wasted. Furthermore, statutory changes are not really needed because EPA has not been giving many waivers in estuarine areas. Concerns that the current regulations have opened the door for a mass reduction in secondary treatment in estuarine areas simply are not well-founded.

By the same token, the amendments in the bill would exclude waivers in stressed waters even if there is no impact on the receiving waters from the less-than-secondary effluent. Such a change would seem to be unnecessary.

H.R. 3282 would also require POTW's to demonstrate that they have a pretreatment program in place which in combination with the less-than-secondary treatment systems removes the toxic compounds at the same rate that a secondary treatment system does without pretreatment. This is extremely difficult to prove for several reasons. One is that removal data for secondary plants does not exist for all pollutants in question. Second, the pollutants in question are not clear. Are they the ones scheduled for categorical pretreatment regulation or are they the all 129 priority pollutants? Third, the information that does exist for secondary treatment removal shows wide variation in removal. The proposed amendment is not necessary in light of the current regulations which have extensive toxic control and bioaccumulation sections.

Finally, I would simply note that the bill makes reference only to "interstate" estuaries. However, there are some important estuaries wholly contained on the coast of only one State, such as the San Francisco Bay, Puget Sound, and Trinity-Galveston Bay.

With respect to section 404 dredge and fill permits, in regard to this provision of H.R. 3282, we are concerned that the language is vague and places an unreasonable burden on those applying for dredge and fill discharge permits. Specifically, the measure pre-

cludes specification of a site by the Secretary unless he determines that the discharge will not have an "unacceptable adverse effect" on the aquatic environment and that there is "no practicable alternative." Mr. Chairman, we believe that it will be very difficult to properly interpret and utilize these terms. Accordingly, they are virtual invitations to litigation, which would only serve to delay implementation of this provision.

With respect to nonpoint source pollution, while H.R. 3282 does not deal directly with nonpoint source pollution, we would urge the subcommittee to explore this issue. Recent studies have pointed out that nonpoint sources are major contributors to our water pollution problems, and the Federal Government has yet to address this important aspect of water pollution in an effective manner. We will be happy to call upon our members who work close to this problem to assist the subcommittee, if you so desire.

With respect to the water quality standards issue, H.R. 3282 basically requires a nondegradation policy for the national water quality standards. While we certainly concur that permitting a lower level of water quality in any body of water should be permitted only under unusual circumstances, we feel that the provisions of H.R. 3282 are too strict. They would be especially difficult to implement in the absence of a national strategy to control nonpoint source pollution.

In particular, we would note that the existing water quality standards were developed utilizing little or no concrete data. To freeze those standards as of January 1, 1983, and thus not allow consideration of new data certainly would seem to be an unwise decision.

Furthermore, the conditions specified in H.R. 3282 under which standards could be waived are stated in very vague terms, which would be difficult to implement and would invite future litigation.

Therefore, we suggest that no legislative changes be made at this time.

In conclusion, Mr. Chairman, while we recognize the need to thoroughly review the Federal Water Pollution Control Act at this time and to make certain adjustments, we encourage the subcommittee to make as few changes as possible, and to emphasize the need for a stable program. The National Society of Professional Engineers believes that such a stability will be a crucial component of a successful ongoing national effort to maintain and improve water quality.

Mr. ROE. We thank you for your testimony.

Are there any questions? The gentleman from Arkansas?

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman.

Thank you, Mr. Prime, for your very comprehensive testimony. Mr. Prime, it seems that there is a certain tension in your testimony between maintaining program stability on the one hand, and moving program financing in the direction of increased reliance on loans and reduced reliance on grants on the other.

Do I understand your testimony to say that while you believe a mix of loan and grant funding may be best, even more important than increasing construction grant program financing is the need to allow the program to operate as it is currently structured for as long as possible?

Mr. PRIME. With respect only to the financing, if I understand your question correctly, your question relates to the financing aspects, our position is, that is one area where change is needed. We have addressed that we need changes in areas, and in other areas we would like to leave them alone.

Mr. HAMMERSCHMIDT. Let me ask that part of the question again. You believe that a mix of loan and grant funding may be best. You want to move in the direction of increased reliance on loans and reduce reliance on grants?

Mr. PRIME. Yes, sir, we recognize what I believe to be Chairman Roe's position, that there are many——

Mr. ROE. Oh, I haven't stated it yet.

Mr. PRIME. Through your questioning earlier, I am sorry. There are many communities that must receive some form of Federal assistance to meet the objectives stated in the act. The problem is we have had a decade of experience with the grants program. For the reasons I have outlined that experience has been less than optimal. We have watched projects that could have been funded in a period of 4 to 5 years stretch out to 8 or 9 as the national average. That is not the horror stories. That is the national average.

Our source of data there was EPA. That results in increases of project costs. We have watched the loan programs where the bureaucratic redtape is less and lower move in a much more expeditious way. We feel that that would be a goal that we should move toward.

Now, because we have committed to the communities, we will give you funding. Particularly those that in good faith started in, went through all the redtape, got the first year's funding on a segmented project. Achieved the proper position for funding on the State priority list, not the planning portion, but in the fundable portion. They should go ahead and proceed through the process at current funding levels, and then start into the grant, or loans program, I am sorry, and let that carry the program for the next 10 years.

Mr. HAMMERSCHMIDT. As I am hearing you, you just restated your case the way I understood it, I believe. In other words, you don't want to grant money alone. You want to go ahead with it. You want to rely more on loans and you think stability in the program is the most important thing.

Mr. PRIME. Yes, sir.

Mr. ROE. Would the gentleman yield?

Mr. HAMMERSCHMIDT. I yield to the gentleman.

Mr. ROE. I have to tell you something. Your testimony is very provocative to say the least. I don't understand what you are talking about. When we got into the point of the loan area, are you talking about loans on top of the 55 percent? Are you suggesting that?

Mr. PRIME. No, sir, that is for those projects that would not be funded——

Mr. ROE. What puzzles me is, what gives you the idea that it is going to work better if there is a loan involved? We have operated under a lot of loan programs and it hasn't done any better. That is the thing that confuses me. Are you suggesting we don't have any

grant system at all and go into a loan system, is that your ultimate goal?

Mr. PRIME. Yes, sir.

Mr. ROE. Are you suggesting that here we have a State such as mine or Arkansas and we have 500 projects pending. And they are all polluting. We are trying to get to them as quickly as possible. You think we are going to get to them faster that way.

Mr. PRIME. Yes, sir, faster and, "get more bang for your buck."

Mr. ROE. Do you think it is fair for us to say like in my State, for example, where those people on the top of the priority list, they should get the money and the others should wait? Or we should just delay those and finish the others first? Isn't that polluting, too?

Mr. PRIME. We are again saying, transition from the grant to the loan, I hope. We are not saying the loan on top of or in addition to. Go ahead and give the ones that your State agency, I am not familiar with New Jersey for certain, but it is probably the State now that is managing the priority list, not the regional office of EPA. The State has probably made commitments to certain communities to fund them.

Go ahead and fund those. Don't go back on the commitments that have been given. The ones that have not received commitments as of fiscal year 1984, tell them, we will make low interest loans available to you. It has about the same impact on the ultimate user fee. If you look at the current market rate for money, municipal financing, and compare that to the 5-percent rate, you will find those communities doing a better job of planning. Not playing the games that are played within the grants program. You will find that happening quicker. You will find, again for the reasons in our testimony, that that will generate more pollution solutions, if you will, in a shorter period of time and with the same amount of money, commitment on the Federal Government's part, within the grants program. We have watched the FmHA program work, particularly for small communities. And it seems to work quite well.

The way FmHA administers it is that if the rates fall within a certain percentage of the median income of the community, then they can support that with a little bit of grant money. But I don't think we are advocating that. You might want to consider it. Again, we feel that is a better delivery mechanism for a lot of reasons than the pure grants approach.

Mr. HAMMERSCHMIDT. Mr. Prime, I would, just to reclaim my time, Mr. Chairman, I would agree with you that the Farmers Home program does work very well, this loan and grant program. It appears to me that if we followed your suggestion, we would need to pass new legislation for a purer loan program, or we might use a provision, the loan guarantees for construction of treatment works which is section 213, which has never really been implemented.

It has never been funded and guidelines never drawn. But of course it is a guaranteed loan rather than a direct loan. Do you want to comment on that?

Mr. PRIME. First, we as a committee haven't discussed 213. I have no personal experience with it. It may be the right mecha-

nism. Again, I think we would be willing to come in and give you some help, work with your staff to see if we could flesh out a workable program within the confines of section 213 of the act as it currently exists.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Prime.

Mr. ROE. Any further questions?

The gentleman from California.

Mr. ANDERSON. Thank you, Mr. Chairman. Just a couple of clarifications.

You talk about the financing package and combination of grants and low interest loans for communities under 25,000. Why did you pick 25,000? In the areas that I am most familiar with, the ones that perhaps need the most help are the bigger ones, and not the small ones. I am not saying small ones are not needed but the ones, the big ones. Why do you just suggest aid for only the small 25,000 or less communities?

Mr. PRIME. I am looking for that.

Mr. ANDERSON. Professional engineers and private practice division conducted a national system of financing package using different combinations of grants and low interest loans for communities under 25,000 and so on.

Mr. PRIME. All right. We are not recommending that this only apply to communities below 25,000.

Mr. ANDERSON. In other words, you are talking about using it straight across the board, you are just using a study of 25,000 to back up your deal.

Mr. PRIME. That is right.

Mr. ANDERSON. So I don't have to worry about the larger communities in my area if this type of suggestion were to come in then?

Mr. PRIME. That is correct.

Mr. ANDERSON On the loan part, I personally prefer grants with a matching requirement from the local agency. I think that ties them in a little tighter and more realistic.

If you make loans, would you still require a matching basis on the local community or an outright loan so it would be a 100-percent financing from the Government?

Mr. PRIME. I would recommend a 100-percent loan.

Mr. ANDERSON. And the next thing is if they can't pay it—and I can think of many communities now that obviously could not pay it, perhaps need it most, might be able to come up with a little matching but could never pay back a 100-percent loan—what do we do? Have a bill come in 2 years later with a forgiveness program? Because I have seen that in so much loan legislation that they come in with great ideas, and they are good ideas, we give them a 100-percent loan.

Then a few years later they obviously can't pay it. Then a Congressman starts saying we will give us a forgiveness program. We forgive them for 10 years.

Then another 10 years. Pretty soon we wipe it off. Now, is that the answer? Or if they can't pay it and I know of many that can't, what do you do? Foreclose on the community?

Mr. PRIME. OK. Let me make one point and then answer the question.

The point I would like to make is that, again, based on our analysis that you referred to, the rate that would have to be charged to the citizens of that community would be very similar, very little difference between that and the rate that would be charged if the community received a grant, 55 percent or 75 percent.

Oftentimes, you will find the O&M component to be as significnt as the debt reduction. So the fiscal impact would be the same.

Let's say, as long as you are talking about the same project, if they can come up with the local share, the matching share of a grant, it will cost them about as much money as a 100-percent loan at 5-percent interest rate for 40 years.

So the fiscal impact on the community would be similar. With respect to whether waivers should be given, again, I think you should consider a similar process to what we have now which is where the community has to show that they have or will adopt ordinances and rates appropriate to repay the debt.

This is common practice in municipal financing through conventional techniques if they have to bond the local share. I would say by far the large majority of them just do that.

They are not funding the local share from cash on hand.

Mr. ROE. Will the gentleman yield?

Mr. ANDERSON. Just one last thing. I am a little bit worried about how you collect that money. Again, when I first thought you were talking about smaller communities, I did visualize smaller communities maybe being able to have a $53 per household tax on each one added.

But then I got to thinking about New York where they are having a tough enough time just to be able to maybe get food on the table. I wonder how the mayor of New York would like to have to tack a $55 tax on every household in New York to finance this thing.

I think they would not do it this way. They would have to go someplace else to get this financing.

Mr. PRIME. You would control that. Let's talk about the existing scenario. You are giving out 55 percent. They have to come up with the other 45 percent.

Depending on the market conditions for money at the point they go to the bond market, this $55 difference could evaporate. This analysis was done assuming 10 percent cost of money for the local share.

If that cost of money goes back to 15 percent, which it has been there, I would say to you that the 55-percent grant will cost the resident more than 100 percent loan at 5 percent.

Mr. ANDERSON. Now, you are aware that some States, California where I am from is one, has passed a proposition where local governments cannot put a new tax on. They are prohibited by laws voted in by the people.

There is no way they could put an additional $55 per household tax without changing the laws of the State.

Mr. PRIME. Yes. I would strongly recommend—again, this is a personal recommendation, not a statement of policy, but based on my experience with municipal government—strongly recommend that you not think in terms of taxes for the local share.

Let that be a function of user——

Mr. ANDERSON. I just saw your $53 per year, per household that you have to raise somewhere.

Mr. PRIME. Through user fees or impact fees. Again, that $53 is only valid if your cost of money is 10 percent versus 5 percent subsidized loan. If the actual market conditions change to 15 percent, which I don't want to crystal ball the cost of money, but it is a realistic figure, then that $50 will go away.

Mr. ANDERSON. I am going to have you come out to my district and answer some of my constituents. You can answer this a lot easier than I can.

I am trying to answer now why they have to pay more for their telephone per month. If you are going to add 53 bucks per household, it is going to be very difficult unless you find some other way. A new user tax where they don't know they are paying it, I don't know how you are going to do it.

Mr. MOODY. Will the gentleman yield?

Mr. ANDERSON. Fine.

Mr. MOODY. You suggest we switch to user fees rather than taxes. One of the big advantages of not doing that is that property taxes are federally tax deductible and user fees aren't.

The appropriate tax enables you to export the burden of the communities back to, in fact, a substantial degree. So what you make in one statement has a tremendous fiscal negative impact.

Mr. PRIME. I understand your point. Let me first say existing EPA rules will not allow for taxes to be used to pay the local share of construction grants projects. Under today's rules you are not allowed to use property taxes.

There is one exception, and it does not apply in Florida so I don't have personal experience.

Mr. ROE. Will the gentleman yield?

You are not clear. Are you talking about 100 percent loan money?

You are talking about a function of time and space. I agree with you.

I think you have made a good point. We have adopted that process, or at least that theory in our $800 million loan for water rehabilitation program in the water resources development bill so we have taken that step.

But I think what you have to clarify, which is very important in my judgment, is are you talking about 100 percent low interest loan money?

Mr. PRIME. Yes.

Mr. ROE. That is a very, very different point in my judgment than your testimony came out. I think it is very important to say a project is x number of dollars, and we are talking about 100 percent loan money at, let's say, a pegged interest rate, a low interest rate over a longer period of time.

Mr. PRIME. Right.

Mr. ROE. In other words, in the water resources development bill, what we are saying is that time is a function to that issue. We have already run the curves on that as far as costs are concerned and user fees.

We have said if it is going to be 100 percent loan money, 5 percent, whatever the case may be, a stabilized rate, that is a whole switch in the whole program.

Mr. PRIME. Yes.

Mr. ROE. I am not suggesting you are wrong. I think there is some merit to what you say. You know it is awfully difficult to digest the point of view that we are going to cut out a 50-percent grant on the table and come back and give you a 40-year 5-percent interest loan figuring they are going out on the bond market for 12 or 13 percent now.

Mr. PRIME. Yes. I am sorry I didn't make that point earlier.

Mr. HAMMERSCHMIDT. Will the gentleman yield?

Mr. ANDERSON. Go ahead.

Mr. HAMMERSCHMIDT. I just want to follow up on the chairman's question.

You are suggesting the lowest household rate would be the combination of a grant and loan. That is usually what occurs under Farmer's Home. That is the ideal situation, isn't it, where you get up to a certain level of charge to a household?

Mr. PRIME. Yes. FMHA will provide for a combination loan and grant if the resultant impact is above a certain percentage of the median income of the community. That is a workable system.

Mr. HAMMERSCHMIDT. I think it is, too.

Mr. ROE. The gentleman from California.

Mr. ANDERSON. Yes, I was just kind of wondering. You are giving me a little different concept of a user fee, then. I think my feeling of what a user fee was, you had a choice.

If you wanted to buy a boat, you had to pay a user fee. If you wanted to have something else, you pay a user fee.

In water, it is a different thing. Everybody needs so much water. So you are talking about a user fee on everybody to at least a minimum amount that each of us use and consume personally today.

I realize some of us use more than others in irrigating and stuff like that, but what you are talking about is a new concept for the words "user fee." User fee is normally for something you have a choice not to do. It is not something every person has to do.

We have to use our water every day, everyone of us here.

Mr. PRIME. Well, it is not a new concept. It may be in your area of the country. Most municipal financing which is done through revenue bonds as opposed to general obligation bonds is repaid through user fees.

In fact, there are bond covenants that relate to how those fees would be set. Furthermore, EPA requires through the existing regulations that the community demonstrate that they can satisfy their operation, replacement and maintenance requirements through user fees specifically.

Furthermore, that those user fees be set equitable between user classes. So that has been in the regulations, I know, for the last 5 or 6 years.

Mr. ANDERSON. If they can't pay, then what? We are going to go to the user. I am thinking now again about the metropolitan areas. I mentioned New York awhile ago. People today who are getting welfare just to live.

This user fee that they wouldn't be able to pay, what do we do with that?

Mr. PRIME. That is addressed differently in different communities. The point is that it is a fee for having a commodity provided. You can effect the user fee or cost to the household by moving the rate at which you consume, if you will, one of this Nation's greatest resources, and that is water.

That encourages water conservation. There is a school of thought that that is not a bad idea. If you don't tie it to a consumption basis, it has been shown that some people abuse the privilege and squaunder the resource.

So there is more than one way to view that issue. But it is not a new concept. The concept has been around for quite some time.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. Prime, I am particularly interested in your ocean dumping discharge waiver provisions. The present system has created some problems in some areas. The San Diego Bay area, for example, has tried to receive waivers of the existing provisions, and to compete with areas like New York Harbor, and so forth, where there is an entirely different scenario than in the San Diego area because of nonpoint pollution. Just the size of the problem is different.

They have not been able to receive waivers. Under the provisions of the proposed legislation, I think it will tighten up those restrictions. You have addressed that.

What provisions would you recommend be made in the proposed legislation that would allow a variation of circumstances to play a part in the decisionmaking process of waivers?

Mr. PRIME. Mr. Congressman, I have no direct experience with ocean discharge. This is the one thing that I am personally weak on. I understand the other issue better.

I think it may be appropriate for us to get back with the committee on that. I was under the impression that under current statutes, if the administrator was faced with unique situations, they had the authority to grant exceptions, and particularly with respect to the relaxation of the secondary treatment standards, and that this was to affect the discharge into estuaries and so forth.

I, however, am uncomfortable with that answer and prefer we get back to you on that.

Mr. PACKARD. I think you recognize under current legislation that very few waivers are granted.

Mr. PRIME. Yes.

Mr. PACKARD. Over the last 6, 7 years that the law has been in existence, there have been very few, nationally, waivers granted. Perhaps under the proposed legislation, there would be even less, whereby several areas are seeking relaxed regulations that would permit waivers to be granted on the basis of meeting water quality, rather than on specific, almost impossible, standards to meet.

My own area is a case in point. They are willing to meet the water quality standards and would hope to be able to get waivers on that basis, but have not been able to do so.

I thought maybe you would have some specifics in terms of how to address the new legislation that would permit that flexibility.

Mr. PRIME. I apologize. It is my personal shortcoming not being an expert in that area.

Should we follow up to the committee?

Mr. PACKARD. I would say probably to the committee.

[Additional testimony of Mr. Prime, National Society of Professional Engineers, appears on page 3383.]

Mr. ROE. If the gentleman would yield, I happen to think that your testimony is extraordinarily important simply because of the organization you represent.

I think it would be enormously helpful to the committee in two directions. One, the ocean dumping which is a major concern of ours. The second point I would like you to amplify further, is the combination loan and grant program.

We know that that is implemented in part under Farmer's Home which has worked really quite satisfactorily. I don't know whether I agree with all the points you have made.

You have to give us more on it. You have glossed over it. I think what we ought to do is ask you to come back again in depth on the ocean dumping issue and in depth on your proposal of financing with some particular examples, so that we can digest that.

That would be helpful to us. We would like to have you come back again.

Mr. PACKARD. What would help me is precisely what the chairman is asking for, recognizing that there is a serious problem in the New Jersey/New York area. But the water pollution problems there are significantly different than they are in San Diego Harbor.

To require San Diego Harbor to meet the same conditions that New York and New Jersey area is being required to meet may present an impossible situation for San Diego.

Mr. PRIME. Yes.

Mr. PACKARD. I am looking for a way to meet the needs of cleaning up the water in the New York Harbor and off the shores of New Jersey. But at the same time, allowing some flexibility so that those areas that do not have the same kind of problems are not required to live by the same kinds of standards, and therefore making it impossible for them to even consider a waiver, which is very expensive for them to continue the way they have been going.

Mr. PRIME. We will address the issue. Mr. Chairman, so I can understand, are you saying that you would like for us to come back to give more oral and written testimony?

Mr. ROE. Yes; we will invite you to testify again.

Mr. PRIME. All right, sir.

Mr. ROE. I would also like you to get into another issue from a purely engineering point of view. We have been trying to get across for the last 15 years one element that has to do with elimination of combined sewers.

Frankly, we have not been successful because the people just don't understand the issue. That goes to the point of pretreatment. Query: what do we do? Do we strengthen the pretreatment aspect of it, then come back and say, well, the ultimate sludge we receive from the receiving, whatever, sewage, regional plant is not contaminated with heavy metals and so forth?

Or do we look at the ocean dumping aspect of it. If we don't have pretreatment, it gets to the sludge. Do we dump it in the water, on the land? What do we do?

I think you folks are in a particularly unique situation to talk to us in a purely technical engineering point of view. We can write all the laws in the world and that isn't going to change anything in my humble judgment, if you will pardon me. I don't mean that unkindly.

We are looking for what is a solution to the problem. Do you understand what I am trying to get at?

Mr. PRIME. I fully appreciate it.

Mr. ROE. Therefore, I think the gentleman from California has made it very clear. We would like some more indepth—we are not looking for philosophy. I don't mean that unkindly. We are looking for what do we do.

So we need some more technical response from you.

Mr. PRIME. It may be appropriate, if the chairman desires, for us to get into the breadth of issues you are addressing——

Mr. ROE. Yes.

Mr. PRIME. We would need to provide for you more than one expert, if you will.

Mr. ROE. Yes.

Mr. PRIME. There is probably a different person——

Mr. ROE. Bring that panel. We want to hear from the engineering society. I think you have done marvelous in your initial testimony here. You have made us think.

We want to hear from you the key issues we are dealing with. I know that if we don't solve that combined sewer problem we are fooling the people.

You know it as well as I do. So we have got to deal with that. Now, how do we convince the authorities that be, the administration or any administration, and everybody else, that this is something we have got to do, otherwise we are not going to solve the problem?

Is that a reasonable point?

Mr. PRIME. Absolutely. Our staff will be in touch with your staff to set a time. And the characteristics, if you will communicate to your staff a list of things that you would like for us to address. I have heard you say the ocean outfall, financing, pretreatment and combined sewer overflow issue.

If there are others, we will then assemble a group of people that we think can speak to those issues and offer you a panel.

Mr. ROE. We will set an agenda and get back to you. The gentleman from Wisconsin.

Mr. MOODY. Before I ask my main question on that point, I want to follow up with the chairman's comments. If you deal with plants with overflow, I think there may be trouble for you to reconcile that with your statement of stable funding, since this is an expensive ticket.

Mr. PRIME. I understand.

Mr. MOODY. I would like you to elaborate more on your section of the testimony which, by the way, I think is excellent about nonpoint source pollution. You give a very short paragraph to that.

As someone new to this area, to some extent I have followed it locally, but, in my community, but we have a tremendous nonpoint source pollution problem. And the city of Milwaukee that I represent is under a tremendous financial burden to meet standards that have been set down in court stipulation to water quality.

At least half, if not more, of our problem is nonpoint pollution, which we can't do anything about given the environment we are living in. So we are pressing harder and harder on the urban taxpayer to handle the point source pollution problem, but this runoff from both rural and shipping center stuff that is coming in, we are just ignoring that.

How realistic is it to work harder and harder on one-half of the problem and let the other half be exempt?

Mr. PRIME. Our position is that the Federal Government has not spent enough time and energy on the water quality problem, too much on the—you can see an outfall from a waste waterplant and regulate it easier than you can the diverse nonpoint.

So we understand maybe the reasons, and I will talk personally now, not as a society, because we have an official position on this, my personal feeling is that we are spending too much money in waste water treatment plants to solve a problem we can't solve through waste waterplants.

In Florida where I have personal experience, it is clearly shown that in some areas as much as 80-plus percent of the pollutant loading to our lakes—and we have a temendous number of lakes—is from nonpoint sources.

Yet in one community that is probably one of the fastest growing communities in the Nation, they have been faced with a no discharge at all to surface waters. Just no pollutants. Zero. Is that fair? Should it have been that way? Or could we not have spent the same number of dollars to deal with pollutants coming from nonpoint sources, and had a larger effect on the actual quality of water in the surface—surface waters.

Mr. MOODY. In other words, there is both an efficiency question, bang for the buck.

Mr. PRIME. That is right.

Mr. MOODY. And also an equity question, isn't there?

Mr. PRIME. That is correct.

Mr. MOODY. We let one group of polluters off scott free.

Mr. PRIME. The Clean Water Act addresses it through section 208. Lord knows, every council in the country went around trying to talk about 208.

But as a society, we did not feel it got quite far enough. It said here are some BMP's, and here are some model ordinances that you may or may not adopt. But there was nothing that said you had to adopt them.

Again, that may be the bigger problem as far as the Nation's waters are concerned.

Mr. MOODY. Have you had a chance to look at the Oberstar bill?

Mr. PRIME. No, sir. I haven't.

Mr. MOODY. Maybe when you come back you would have had a chance to look at that.

Mr. PRIME. Yes.

Mr. ROE. I think the gentleman is making an extraordinary contribution this morning. In my judgment, speaking as one member of this committee, I totally subscribe to what the gentleman is saying from Wisconsin, that we have not given the attention to that issue.

I put that in the same category like a broken record with that combined sewer situation because I know exactly what is happening, particularly in the urban areas of America, the old urban areas.

So it would be very helpful to us that as we put together your agenda, we would like you to direct your technical attention, to give us an overview what you see in that particular nonpoint. I think that is the wave of the future as far as this legislation is concerned.

Any further questions of the gentleman.

If not, we want to thank you very much and will call you back. Our staff will be in touch with you to proceed from there.

Thank you very much for your excellent testimony.

[The following was received for the record from Mr. Prime:]

February 2, 1983

Draft Report of the Committee on
Construction Grants and Loans - NSPE/PEPP
"COST OF CLEAN WATER - IMPACT ON SMALL COMMUNITIES"

A substantial backlog of necessary water pollution control projects in small communities and scheduled reductions in the Construction Grants program make it likely that many small communities will have to construct their improvements with reduced or no grant support. This may place the cost of wastewater treatment outside the reach of many small communities.

The use of less costly methods of wastewater treatment such as lagoons or trickling filters, which may be permitted where they do not cause water quality degradation, does reduce user costs. This substitution, however, will not offset reductions or the elimination of grant support. Low interest loans, such as the 5%, 40 year loan available through the Farmers Home Administration, in combination with a 55% grant, can yield user charges comparable to those under the current 75% grant program. However, we view the recent reductions in federal aid as a trend toward zero grant support. This paper evaluates the impact of that trend on small communities of 25,000 or less.

Background

From 1972 to 1980, the heyday of the construction grants program, the federal government obligated over $29 billion for the construction of water pollution control facilities. Wastewater treatment plants of less than 1.05 mgd constitute 79% of the number of treatment plants in the U.S. but account for only 8.4% of the total treatment capacity. Treatment plants over 50 mgd comprise only 0.6% of the number of treatment facilities while accounting for 38.8% of the total U.S. wastewater treatment capacity (Feliciano, 1982). In order to achieve the maximum benefit for pollution control dollars spent, grant monies were intentionally directed by Congress and EPA toward the larger dischargers. As shown in Figure 1, only 31% of the grant money went to communities with populations under 25,000 and only 12% went to communities of under 5,000, despite the fact that such communities represent 95.6% and 80% respectively of the total number of communities, and contain half of the country's population.

Many factors have contributed to the substantial backlog of wastewater treatment facility needs in small communities. Grants were awarded based on state

FIGURE 1

DISTRIBUTION OF PLACES, NUMBER OF GRANTS AND GRANT DOLLARS BY COMMUNITY SIZE

Source: EPA 1990 Preliminary Draft Strategy for Municipal Wastewater Treatment January 1981

priority lists which tend to favor larger communities due to population points, volume of discharge and other factors. In addition, the EPA regulations in effect during the 1970's tended to favor regional treatment plants as opposed to smaller local treatment facilities. EPA required extensive documentation to justify the need for sewers in order to obtain grant support, and otherwise made facilities planning in small commmunities difficult. In many cases, small communities could easily obtain a Step I grant for preparing a planning report only to be too low on the priority list to implement the plan. The very existence of the grant program tended to discourage and delay the construction of wastewater treatment facilties in many small communities since it is difficult to justify the expenditure of 100% local funds when the possibility exists for receiving a 75% grant. In addition, many small communities had existing facilities, such as trickling filters, which could not consistently meet the treatment levels required by PL 92-500. In some cases those facilities were anticipated to be abanooned and therefore not maintained as well as they would have been otherwise.

The Municipal Wastewater Treatment Grant Amendments of 1981 authorized $2.4 billion for construction grants in fiscal 1982 and the same amount for each year after until 1985. Grants awarded prior to October 1, 1984 will qualify for a federal grant of 75% of the eligible costs while new projects after October 1, 1984 will only receive a 55% grant. In addition, the categories of eligible projects will be reduced after October 1, 1984 and new sewer construction will be ineligible. Thus, it appears that the Construction Grants Program is going to be phased out, placing the burden of providing wastewater treatment back on the local community and, ultimately, the individual users.

The costs of providing wastewater service have increased substantially over the years as higher levels of treatment have been required. Smaller communities are particularly subject to high treatment costs for a number of reasons. Frequently located on smaller streams which are classified by states for higher water quality levels, they may be required to construct more expensive advanced treatment systems. In addition, small communities generally have lower per capita revenues, lower bond ratings and are required to pay higher bond interest. Many small communities lack centralized sewer systems entirely and thus are faced with the added cost of building sewers.

20-955 O—84——69

In addition to reducing the federal share of grants, the Municipal Wastewater Treatment Grant Amendments of 1981 revised the definition of "Secondary Treatment" to include oxidation ponds, lagoons and trickling filters when water quality will not be adversely affected. These processes which do not consistently provide the same level of pollutant removal as the PL 92-500 definition of secondary treatment facilities are less costly to construct and operate.

Method

The impact of the reduction and elimination of the grant program on costs per household in small communities is evaluated for communities with treatment plant design flows of .01 mgd to 4 mgd, utilizing conventional secondary processes, trickling filters or waste stabilization ponds. The cost of sewer construction is not included in this evaluation. It is also assumed that existing wastewater treatment facilities cannot be utilized and that a new treatment facility must be built.

Total project cost curves for constructing wastewater treatment plants with design flows ranging from .05 mgd to 4 mgd are estimated for treatment plants providing secondary treatment, plants utilizing trickling filters, and waste stabilization ponds (Figure 2). Building costs are based on the EPA manual "RFD-22 Construction Costs for Municipal Wastewater Treatment Plants: 1973-1978" and include 27.9% for planning, engineering and contingencies. The costs are updated to the second quarter of 1982 based on the EPA Small City Conventional Treatment (SCCT) index. The waste stabilization pond cost includes a nominal land cost.

The range of design flows for trickling filters and waste stabilization ponds were limited by the availability of construction cost data as well as practical considerations. As shown in Figure 2, the cost for constructing a waste stabilization pond or trickling filter is less than that for contructing a secondary treatment facility. Since the secondary treatment curves were developed by EPA using construction costs for existing secondary plants, including some trickling filter facilities, the secondary treatment curve is probably lower than it would be if trickling filters had been excluded.

Local costs for debt retirement for each type of treatment facility are calculated three ways: no federal grant assistance, a 55% federal grant and a

FIGURE 2

TOTAL PROJECT COST VS. DESIGN FLOW

75% federal grant. The annual cost for debt retirement of the local share is based on municipal bond sales of 25 years at 10%.

User cost for debt retirement in each case is then calculated assuming that the treatment plant is being operated at 75% capacity with average household flow based on 3 persons per household and 120 gallons per capita. Table 1 indicates the service population and number of households corresponding to selected design flows.

TABLE 1
Population and Households
Served at 75% Design Capacity

Design Flow (mgd)	Population at 75% Capacity	Number Households
0.05	313	104
0.1	625	208
0.5	3125	1042
1.0	6250	2083
2.5	15625	5208
4	25000	8333

Operation and maintenance (O&M) costs, including administration costs, are estimated for secondary treatment and trickling filter plants with design flows of 0.05 mgd to 4 mgd based on the EPA Manual "RFD-22 Operation and Maintenance Costs for Municipal Wastewater Facilities". The costs are updated to the second quarter of 1982 based on the EPA OMR (Operation, Maintenance and Repair) index. An operation and maintenance cost curve for waste stabilization ponds was estimated based upon existing facilities in Michigan since comparable information was not contained in the EPA report. Table 2 contains the estimated annual operation and maintenance cost for selected design flows for each facility. As would be expected, trickling filters and waste stabilization ponds generally have lower O&M costs than secondary treatment facilities. The O&M for a 1 mgd waste stabilization pond, however, is estimated to be higher than that for the comparable secondary or trickling filter facility. This may be due to the limited amount of data used to develop the curve.

Table 2
Estimated Annual Operation and Maintenance Cost for
Secondary, Trickling Filter and Waste
Stabilization Pond Facilities

Design Flow (mgd)	Secondary[1]	Trickling Filter[2]	Waste Stabilization Pond[3]
0.5	$ 11,900	—	$ 7,000
0.1	21,582	—	13,800
0.5	71,940	$ 65,945	64,000
1.0	119,900	101,915	125,000
2.5	238,700	214,830	—
4.0	327,305	297,550	—

1. FRD-22
2. FRD-22
3. Actual facilities in Michigan

User costs for operation and maintenance for each case are then calculated based upon the same assumptions stated previously.

The total estimated annual cost for a typical residential customer, three person household, is derived by combining the user cost for debt retirement and the user cost for operation and maintenance. Figure 3 illustrates the estimated annual cost for a typical residential customer for secondary treatment, trickling filter and waste stabilization ponds for each of the three grant scenarios.

According to the 1980 Census, the median family income in the United States was $19,908 in 1979. According to the EPA Criteria (CG-82), annual user charges should not exceed 1.75% of the median household income when the median income exceeds $17,000, 1.5% when the median income is between $10,000 and $17,000 and 1% when the median income is under $10,000. Adjusting the 1979 U.S. median family income to household income, applying the appropriate percentage (1.75) and updating costs to 1982 via the consumers price index (CPI) yields an excessive user cost limit of $400. Any user cost having annual user charges exceeding $400 is considered to place an excessive financial burden on users of the system.

FIGURE 3

HOUSEHOLD COSTS AS A FUNCTION OF DESIGN FLOW FOR SECONDARY WASTEWATER TREATMENT, TRICKLING FILTER AND WASTE STABILIZATION PONDS UNDER 0%, 55% and 75% GRANT SUPPORT

In most small communities, the median family income is substantially lower than that found in larger metropolitan areas. A study performed by the U.S. Bureau of Census indicates that the median family income for an outmetropolitan nonfarm family of four was $17,646 compared to $20,502 for the total United States (U.S. Bureau of Census). Based upon the EPA criteria, any annual user cost in such areas exceeding $304 is considered to be excessive.

The excessive user cost limits for both the U.S. as a whole and the outmetropolitan nonfarm family of four are overlaid with the annual household cost curves developed under the three grant cases. Without grant support, the cost for secondary wastewater treatment would be excessive in small communities with a design flow of 0.35 mgd, population 2188. With a 55% grant, the size of the community that would experience the cost as being excessive would be reduced to .04 mgd or 250 persons, and with a 75% grant, essentially all communities required to construct and operate treatment plants would be able to do so without experiencing excessive costs.

The household cost curves shown in Figure 3 are based on the following assumptions: 1) The community is currently sewered and the sewers do not require rehabilitation, 2) The project involved complete replacement of any existing treatment facility and, 3) The entire project is grant eligible. The cost of new sewer construction, much of which is ineligible, would raise the curves, while the cost savings from being able to utilize existing treatment facilities would lower the curves. Ineligible project costs would raise the 75% and 55% grant curves and bring them closer to the no grant curve. Smaller communities, under 1,500, approximately 0.25 mgd, in many cases lack sewers and treatment facilities entirely, while communities larger than 1500 generally are sewered and may have existing facilities which could be reused. Therefore, the right side of the curves may be higher than would be expected for typical communities of that size while the left side may be low.

The impact of grant reductions on the annual household cost in a community with a population of 6250 is shown in Table 3. The cost savings resulting from the use of trickling filters or stabilization ponds in lieu of secondary treatment does not offset the impact of grant reduction on annual household costs in small communities.

Table 3
Impact of Grant Reduction on
Annual Household Cost in Small Community
Design Flow 1 mgd (Population 6250)

	Secondary	Trickling Filter	Waste Stabilization Pond
0% Grant	$247.04	$227.32	$173.00
55% Grant	143.23	128.77	111.25
75% Grant	105.12	93.30	88.91
55% Grant + FmHA Loan*	103.00	91.13	87.05
100% FmHA Loan*	158.22	143.09	120.10

* 5% FmHA Loan over 40 years.

The U.S. Department of Agriculture, Farmer's Home Administration, (FmHA) provides grant and loans to communities of 10,000 or less for the construction of wastewater treatment facilities. In order to qualify, the community must be unable to finance the project from its own resources or through commercial credit at reasonable rates. Communities with a median family income of less than $9,300, the poverty line, may qualify for a 5% loan amortized over 40 years. If the median family income is over $14,450, FmHA offers a 40-year loan based on a fixed interest rate (market rate) that is determined by the average bond buyer's index at the time the loan is made, currently 10.625%. If the median income falls between $9,300 and $14,450, the interest rate would be 5% plus half of the difference between 5% and the current market rate, currently about 7.8%. Grants are made only when necessary to reduce the average annual benefited user charges to a reasonable level. Competition for FmHA grants and loans is very heavy since the amount of funds is limited and FmHA qualifying projects also include rural water supply facilities. FmHA budgets average only about 17% of the EPA grants budget,

As shown in Table 3, the annual household costs for projects receiving a 55% grant and a low interest rate FmHA Loan, 5% over 40 years, are approximately the same as a 75% grant. For projects with substantial ineligible costs, the 55% grant plus loan combination would be even more favorable. With 100% FmHA

funding at 5% for 40 years, the user charges would be higher than for the 75% or 55% grant cases. However, the use of trickling filters or waste stabilization ponds in combination with the low interest rate loan would approximate a 55% grant situation with conventional secondary treatment. Again, for projects with substantial costs ineligible for grants, such as sewers after October 1 1984, the low interest rate loan could result in user costs more comparable to or lower than the project would have required if it had received a 75% grant.

Conclusions

The impact of grant reductions and changes in the classification of eligible project costs resulting from the Municipal Wastewater Treatment Grant Amendments of 1981 will significantly affect small communities. Due to the state priority systems and other factors, small communities have received a disproportionately small snare of EPA grants in terms of numbers and dollars. There is a substantial backlog of needed projects in small communities which will now have to be funded with reduced or no grant support. Since annual household costs for wastewater treatment in smaller communities are higher than in larger ones, and the median household income is generally smaller, the percentage of families that would be burdened by excessive costs of wastewater treatment would be larger. This paper has evaluated the impact of grant reductions on small communities with existing wastewater collection systems. The impact on communities without existing infrastructure would be much more severe.

The use of waste stabilization ponds, trickling filters or other lower cost treatment facilities will reduce household costs and should be pursued if the community is located in an area where water quality would not be adversely affected. However, many smaller communities are located on water quality limited streams and will therefore be unable to take advantage of these treatment processes. In any case, the use of lower cost treatment does not offset reduced grant support.

Low interest rate loans, such as those available from the Farmer's Home Administration, will help offset the reduction in grant support and the elimination of eligible project categories facing small communities. However, that program has very limited funds and is therefore very selective. Many small communities with needed projects and high user costs are unable to take

advantage of the Farmer's Home Administration program because their median family incomes are too high. Consideration should be given to making a low interest loan program available to smaller communities on a wider scale to help them deal with their water pollution problems. This program could be patterned after the Farmer's Home Loan program but should shift emphasis from family income to the cost for user service and water quality need. However, such a loan program would probably not have sufficient funds to address the tremendous backlog of small community needs.

Some of the states may be able to provide grants, loans or other programs to help local communities finance the cost of clean water. However, we suspect that the majority of the states are suffering budget contraints themselves. Financial consultants and others are investigating such innovative financing alternatives as state banks or selling equity shares in the treatment plant, and these should all be explored.

There is no easy answer to the question of how to finance the backlog of wastewater treatment improvements in small communities. Perhaps the solution must be different for each community. Small communities with existing public utilities should take actions now to finance the operation of their wastewater treatment facilities on a self-sustaining basis rather than anticipate a federal program bailout. User charge systems and rate structures should provide sufficient revenue for operation, maintenance, replacement and capital improvements.

Mr. ROE. Our next group is the New Jersey Clean Water Campaign Panel. We have with us a very fine group of representatives of the great State of New Jersey, so if you all come forward, we would appreciate it, and go into your testimony.

I will now defer to the distinguished chairman of our committee who would like to offer his formal welcome to the representatives from New Jersey.

The CHAIRMAN. Thank you very much, Mr. Chairman.

I wish to thank you and the members of the subcommittee for these hearings that you are holding on this vital matter. Although these next witnesses are a very active group representing thousands of people in the State of New Jersey, I am sure that their story will find its parallel around the Nation.

We have listed Ms. Vivian Li, Chair of the New Jersey Chapter of the Sierra Club; Mr. Ray Bogan of the United Boatmen's Association.

Mr. Bogan and his family have been in the sport fishing business on the Jersey shore for—I was going to say years. I may as well say generations now.

I have been here awhile working with a few Bogan brothers for so many years. Now, all of a sudden I am meeting now a son.

Mr. ROE. If the chairman would yield. You are getting a little more grey hair. I wanted to tell you about that.

The CHAIRMAN. But I have got quite a bit of it, Mr. Roe.

Also, Ms. Ella Filippone from the Passaic River Coalition, a very important part of the State represented by the chairman of our subcommittee. Ms. Jane Nogaki, Coalition Against Toxics. Certainly a big, big problem, a frightening problem, but one that must not be ignored. It must be faced.

The sooner we face it and the stronger we face it, the better off we will be. I would just like to point out in this area of clean water, our State of New Jersey is an industrial State.

Most people know the State just from riding up and down the New Jersey Turnpike and see all the industrial development. Many of them do not know of other parts of the State, such as the beautiful New Jersey shore area.

In New Jersey, the resort industry is the second largest industry in the State, second only to pharmaceuticals, amounting to many billions of dollars each year. When we talk about the need for clean water, we are not talking about it just because it would be something nice to have and because we owe it to future generations to clean up the water. There is a certain vital economic situation involving billions of dollars involved in that seashore, whether it be for the people who come down for swimming, or for vacations, for fishing, for sport, which is a very, very big item, or for commercial.

It is a very big item. Being near the large metropolitan area of New York and its environs, very often in the past years we have thought, the big cities need special treatment. Being such a crowded State without a lot of places to dump things or store them on land, the ocean seemed to be a very available place for it.

It has gotten to the point where this seashore area, so important to the us, just can't take it any more. That is why I am glad we have been able to work together on the outlined legislation which is in a bill I and certain others have introduced. I am very, very

happy that this subcommittee is doing something historic in being prepared as we are to be writing the best clean water bill in the history of this or any other nation.

This group has been organized from many facets of the communities throughout the State of New Jersey, a State of over 7 million people. I believe they have some petitions with many, many thousands of signatures in support of the effort that we are making here in this subcommittee.

We so very often work in some sort of vacuum, Mr. Chairman. When we work on important legislation, a few special interest people such as business or environmentalists know what we are doing but the broad base of the American citizenry really does not know that we are doing much of anything.

They may hear about a bill when it comes up. But I can assure you, thanks to your leadership in this area, Mr. Chairman, I would say that the broad spectrum of the general population of the State of New Jersey is very familiar with this legislation and these hearings that are going on. I am very, very proud that we have in the State the people who have given the time and the effort to contact so many thousands of people to alert them to the fact that they can take part, as they are doing here, in a democratic function in public. We are now able to hear from the people from one of the more important States in the union, the State of New Jersey.

I am very, very happy to welcome them here and I want to thank you, Mr. Chairman, and the members, for inviting them here because I believe that their testimony is not only extremely important and on track, but it also represents, I am sure, millions of people's desires and wishes and needs throughout the country.

Thank you very much, Mr. Chairman. Welcome to all of you. Thank you for your past work, your present work, and the work we are going to be asking you to do in the future.

Thank you. Thank you, Mr. Chairman.

Mr. ROE. Thanks so very much, Mr. Chairman.

I think that is an excellent graphic illustration of what is happening in our State. So why don't we go with our testimony. We will first hear from Ms. Vivian Li.

The full test of your prepared statements will appear in the record at this point.

[Statements referred to follow:]

TESTIMONY OF VIVIEN LI, CHAIRPERSON, NEW JERSEY SIERRA CLUB, REGARDING THE WATER QUALITY RENEWAL ACT OF 1983 BEFORE THE HOUSE WATER RESOURCES SUBCOMMITTEE, OCTOBER 19, 1983

Item: More then 150 acres of prime wetlands in the Hackensack Meadowlands will be replaced by massive development under a permit issued by the Army Corps of Engineers earlier this year.

Item: Wetlands in Absecon Inlet were proposed for destruction as part of a casino development project in Atlantic City approved by the Army Corps.

Both these projects occurred in the State of New Jersey. Both and been approved by the U.S. Army Corps of Engineers as consistent with Section 404 of the Clean Water Pollution Control Act amendments. And in both these instances, other federal agencies had strongly recommended against approval.

These instances are not isolated nor are they confined to just one state. It is estimated that approximately 56 percent of the original wetlands in the continental United States has been lost due to development. Annually, more than 45,000 acres of wetlands are destroyed.

If any state stands to lose from the destruction of wetlands, it is New Jersey. What would New Jersey be without the wetlands and coastal areas that dot our shore and which provide the recreational activities that constitute the second largest industry in the state? Without the fish and shellfish that spawn in our wetlands? Without the flood control benefits that wetlands provide?

From northern New Jersey all the way to Cape May, wetlands are important to the residents of the state. For some, wetlands protection preserves their livelihood. For others, it represents the last remaining vestige of open space in the country's most densely populated state.

Congressional intent in 1977 may have been to protect as much wetlands as possible. Since that time, it is clear that the language of the existing Act contains too many loopholes favoring development. Time and time again, the U.S. Army Corps of Engineers has found justification for non-water dependent uses in wetlands, even in the face of strong opposition from other federal review agencies.

The examples cited in the beginning are but only two of numerous instances where Congressional intent has been disregarded. An equally destructive project is the Timber Properties development near Great Swamp National Wildlife Refuge. The Corps approved a 22-acre townhouse project allowing for the filling of 8 acres of wetlands. The U.S. Fish and Wildlife Service appealed the decision to the Assistant Secretary of the Army where the decision was ultimately re-affirmed.

Although the 1977 Amendments provided other federal review agencies opportunities to object and hold up projects for more extensive review, administrative changes have greatly stymied the process. New working agreements between the Corps and the federal review agencies took away most of the clout they once had and result in a proliferation of types of environmentally-unsound projects cited above.

We believe that the proposed changes under the Water Quality Renewal Act will strengthen existing provisions and provide the type of protection so urgently needed. The proposed amendments prohibits the issuance of a dredge and fill permit by the Corps unlesss it is established that the discharge will not have an unacceptable adverse effect on the aquatic environment and that there are no practicable alternatives which have less adverse effects.

The proposed amendments also bar the District Engineer from issuing a permit within 30 days of notification if other federal agencies express opposition. It requires the District Engineer to explain in writing the rationale for issuance of a permit. Federal review agencies are allowed to elevate a permit to the Secretary of the Army for an ultimate decision.

We believe that with these changes, better and more sensitive decision making will occur. We believe that the proposed amendments will provide protection to a rapidly-disappearing resource, our nation's wetlands, and we urge that you, Mr. Chairman, and your subcommittee endorse these measures.

Thank you.

Testimony of New Jersey Clean Water Campaign

WHY NEW JERSEY NEEDS A STRONG FEDERAL CLEAN WATER ACT

Since the passage of the federal Clean Water Act in 1972, New Jersey has seen substantial improvement in the water quality of its lakes, rivers, streams and ocean. Fish have returned to many waters, pollutant levels have dropped and marine life is once again flourishing in certain areas. In the last four years over 7,000 acres of NJ's coastal waters have been opened to shellfish harvesting, which was previously banned due to excessive bacteria levels. While these accomplishments are encouraging, much more needs to be done in NJ to meet the Clean Water Act goal of making all waterways fishable and swimmable. We must tackle the growing problems of toxics disposal, ocean pollution and wetlands destruction. H.R. 3282, introduced by New Jersey Congressman Jim Howard, strongly addresses these issues.

1. TOXIC POLLUTION

New Jersey, one of the nation's leaders in chemical manufacturing, generates 370,000 tons of hazardous waste annually; much of this ends up in our waters. The federal Clean Water Act requires industries discharging directly into our waters to install best available technology (BAT) to control toxics. While EPA would reduce toxic discharges by 50 percent, they have been slow to issue standards for many major industries. Regulations for pesticides, pharmaceuticals and inorganic chemicals, three major NJ industries, have yet to be finalized.

HOWARD'S BILL

Sets strict but reasonable deadlines for industries to meet BAT requirements to reduce toxic pollution and

Establishes a new program to identify and clean up toxic "hot spots".

2. OCEAN POLLUTION

The Clean Water Act presently allows publicly owned sewage treatment plants to discharge poorly treated sewage into estuaries or the ocean if they qualify for a waiver from the act's nationwide requirement for secondary sewage treatment.

At the same time that 20 million tons of wastes are dumped off the NY/NJ seacoast each year contributing to massive fishkills and contamination, twenty-five plants in the NY/NJ area have applied for discharge waivers. Anything less than full secondary treatment would pose an unnecessary threat to marine life.

HOWARD'S BILL

Severely limits the ability of EPA to grant waivers for municipal treatment plants to discharge into the ocean.

3. SEWAGE TREATMENT

NJ estimates that it needs an additional 2.4 billion dollars for wastewater plant construction to comply with existing Clean Water Act standards. However, the state is slated to receive only 385 million in federal funds during fiscal years 1982–1985. At this funding level, NJ can fund only 24 out of the 237 needed wastewater treatment projects.

HOWARD'S BILL

Increases federal funding for sewage treatment plants from the 2.4 billion annual limit set in 1981 to at least 4 billion annually for the five years, which would increase NJ's ability to meet its sewage needs.

4. WETLANDS

NJ's wetlands provide a vast array of vital ecological and economical benefits. NJ Wetlands:

—Are essential to the state's fisheries industry, especially trout fishing, which generates $50–75 million worth of business annually in NJ.

—Help make NJ the leading producer for cranberries and third leading producer for blueberries in the country.

—Support 90 species of rare plants and provide habitat for a great diversity of waterfowl and wildlife.

However, NJ has lost over 23 percent of its origial wetlands to dredging and filling. While NJ's coastal wetlands are well-protected by state legislation, the federal Clean Water Act is the only means for protecting NJ's inland wetlands. The Reagan administration and certain members of Congress have proposed weakening the Clean Water Act to allow more wetland destruction.

HOWARD'S BILL

Strengthens wetlands protection under the Clean Water Act by setting standards for the issuing of dredge and fill permits for wetlands.

Great Swamp Watershed Association.

TESTIMONY OF RAYMOND D. BOGAN

My name is Raymond D. Bogan. I am here to speak on behalf of the United Boatmen of New Jersey and the Jersey Coast Angler's Association.

I am here to testify on Bill H.R. 3282, the Water Quality Renewal Act. In explaining why we support H.R. 3282. I will try to concentrate on our fishing industry and how it is adversely affected by water pollution. I will explain why we feel H.R. 3282 is the best legislation to fight the threat of water pollution and to clean up presently polluted waters.

Clean water affects the shore economically and recreationally. It also affects the physical well-being of those who swim in it, work on it, and eat food taken from it.

In New Jersey, the recreational fishery brings some $550 million into the state. The commercial fishery brings in approximately $485 million (information provided by the State Division of Fish and Game).

The fishing industry, as well as the rest of the much larger tourism industry of which it is a part, is hurt by pollution and threatened by laws which are lax in water pollution matters.

Specific instances where our industry has been injured by water pollution, juxtaposed with the features of the Bill in question, will explain why the organizations I speak for back H.R. 3282 and its tough stand on pollution matters.

The Bill sets stricter deadlines for industries to reduce discharges of toxic wastes. Warnings on toxins, metals (e.g., lead, zinc, etc.) and other cancer-causing agents are becoming more prevalent. Fin rot--a progressive distruction of fin tissue in certain bottom dwellers—has been shown to be directly related to pollution by toxic wastes (acids, etc.) and sewage. The New Jersey Department of Environmental Protection has been mandated to put out releases every six months on the potential health hazard of PCBs in bluefish, striped bass and eels. These releases have resulted in a 50 percent drop in the bluefishing portion of the industry—a substantial part of the fishing industry.

The Bill places tighter controls on the discharge of poorly or non-treated sewage by municipalities into the ocean. A few years ago it was common during the winter months for scuba divers, who dive for their livelihood as well as recreationally, to tell of the effects of municipal pumping of untreated sewage on in shore wrecks and rock piles, the habitat of many fish. They would tell of scenes where dead lobsters would be piled up to a foot high in these habitats and where fish would be suspended dead off the wrecks as a result of the sewage pumping.

In a dump site offshore of Ambrose Light Tower off of Long Island, New York City sends barges to discharge its sewage. That area has become known as the "Dead Sea," through which fish will migrate but will not dwell.

The increase of funding for sewage treatment plant construction would help in instances where the municipalities are forced to pump sewage into the ocean.

Increasing penalties for Clean Water Act violations would serve as a deterrent to violators who would disregard the mandate of the American public for cleaner water.

Another aspect of the tourism industry as it relates to the ocean can be seen in recreational scuba diving. This activity provides employment for those who cater to the recreational diver. Pollution problems in the Greater New York Bight already restrict the areas in which scuba divers can dive. Increased pollution would further diminish this area and make it impractical for such a business to be carried on in particular areas.

As a case in point, twelve divers who dove from the boat Sister Rib onto a wreck twelve miles offshore of Long Branch, experienced ear, eye, and throat infections, and skin rashes. Two women diving experienced bacterial and fungal infections.

There are bright spots to the affects of legislation which has been directed toward cleaning up the environment where certain municipalities have installed modern sewage treatment plants and its treated sewage is dumped into the ocean. It has been shown that the inshore underwater life is not seriously harmed by this sewage.

In conclusion, after having reviewed the foregoing examples of how pollution adversely affects the fishing industry, you can see the obvious destructive impact on the economic and recreational aspects of this industry. We feel that Bill H.R. 3282 best addresses the problems of water pollution and is the best protector of the environment and our industry which is dependent on the environment for its survival.

TESTIMONY OF ELLA F. FILIPPONE, PH. D., EXECUTIVE ADMINISTRATOR, PASSAIC RIVER COALITION

Mr. Chairman, and members of this Subcommittee, we would be hard pressed to find a constituency anywhere else in the United States which supports the Clean Water Act with more vigor than those in the Passaic River Valley. Since the founding of this Nation, this relatively small river system has provided industry and the public with water resources which brought northern New Jersey to the economic standing which it holds today. Unfortunately, during the early years of this century, disregard of the impact of pollution discharges caused this watershed to be considered one of the ten most polluted river systems in the nation; it has been described as "New Jersey's most maligned public servant."

Since the passage of the Federal Pollution Control Act Amendments of 1972, water quality has begun to improve and we want to see that positive course continued. The public support of clean water efforts has been seen over and over again: Thousands of petitions in the mid-'70's for the Passaic to be the model river; thousands of letters and 'phone calls to stop dumping into the river by a major sewer authority with a break in its interceptor; continuous overwhelming support for state bond issues related to water resources.

Thus, the introduction of H.R. 3282 by Congressman James Howard is perceived as furthering this program's assurances to the citizens of northern New Jersey that improvements toward water quality can be a reality and not just a distant goal.

CONSTRUCTION GRANTS

We have consistently supported a well-funded construction grants program, so as to substantially improve water quality in our river systems. In implementing the construction grants program, we urge Congress to place the highest priority on those facilities which discharge into potable drinking water supplies. While an emphasis existed for the allocation of funds to facilities in the urban area, the focus should be on facilities which impact waters used by the urban areas. For example, in our watershed, the most urban area (Newark, Paterson, Passaic) is serviced by a facility which discharges into Upper New York Harbor, affecting to some degree the coastal waters. However, Paterson and Passaic receive their drinking water supply from the Upper Passaic, which still has several projects which are not even close to the implementation stage on New Jersey's priority list. Such facilities have a direct impact on public health.

Another component of the construction grants program which should have more visibility and accountability is the projected improvement to water quality for the expenditure of funds. This type of assessment has been done in New Jersey for industrial discharges and should be required for POTW's also. The public should be informed of the anticipated improvement in water quality. A commitment, actively pursued, should be made by the States to insure compliance with wastewater management plans. Recently, for example, we were involved with an extremely difficult evaluation on the re-establishment of an industrial facility on the Whippany River, a major tributary to the Passaic which has limited flow at best. Several years ago, under 201 planning, the Morristown facility (built in 1911), was removed from the long, drawn-out planning process to expedite an expansion and upgrading to tertiary treatment. The expansion occurred but the advanced waste treatment did not. This element is a low priority on the State's list; yet lack of this improved treatment will have impacts on the public health and economic needs of the region. We need better management and accountability from the Environmental Protection Agency and the States on the construction grants program.

20-955 O—84——70

SECTION 404—WETLANDS

We in the Passaic River Valley strongly support the maintenance and strict adherence to Section 404 related to the filling of our Nation's wetlands, We are enclosing, as an exhibit, an article by Rod Leith of THE BERGEN RECORD, which reports on the extensive losses of inland wetlands within our watershed. We recognize that this part of the Clean Water Act cannot do all things. However, in addition to controlling fill, the disturbance of the wetlands by soil movement, mining, and alteration of habitat should be a part of this section. Furthermore, other federal agencies which provide funds for needed programs and projects should require full conformance with Section 404 *prior* to application for funds. In the manner, an applicant will know what is expected and may act accordingly. When, for example, a UDAG grant is awarded for development in a riverine wetland, which clearly should not be allowed, considerable frustration and the expenditure of resources on the part of the applicant may occur. Such situations could be avoided if the applicant knew beforehand of the 404 program and the probable degradation resulting from the proposed development. In the case of the Passaic River Central Basin, these waters are drinking water supplies for a majority of northern New Jersey, and have enormous value for flood control.

PRETREATMENT PROGRAM

Uniform national standards are the only equitable manner in which to deal with the pretreatment program. The effluent at the end of the pipe and the sludge disposal programs are contingent on a uniform national program. The ultimate goal must be the removal of hazardous substances such that the disposal of the residue at the plant, either as effluent or as sludge, is not jeopardized. Within the parameters of the pretreatment program, consideration should be included on the reuse of substances removed from the waste stream, as has been done in various European programs. This type of function gets back to a management program, which provides the incentives for a waste exchange.

SLUDGE USE AND DISPOSAL

The sludge management program has floundered because of lack of a comprehensive program which deals with: (1) sludge content; (2) a comprehensive pretreatment program; and (3) volume considerations. The threat to water resources from the lack of a program is mind-boggling in the Passaic River Basin. Sludge management must be planned and implemented on a regional basis. We cannot allow small storage areas to proliferate throughout a watershed. If guidelines were established through an extensive public participation program, such as the 208 Policy Advisory Committee process, an equitable program could be developed. When the Northeast New Jersey Wastewater Management Policy Advisory Committee was active, sludge management had a high priority and was to be undertaken as an issue for review during the continuing planning process. Unfortunately, this process was eliminated. Although some 208 programs in the nation were not successful, we in northern New Jersey had established an active committee of 70 representatives which developed concensus and better understanding on difficult issues.

NON-POINT SOURCES

The only possible process which can control non-point sources of pollution is one which ultimately places the burden of enforcement on the local level. The basic decision on what is or is not permitted may be done on the federal/state level, through guidance and technical assistance but the ultimate responsibility is at the source. In that regard, a major step forward would be a broad-based education program to inform the public on "What is non-point pollution? Where does it come from? How can it be controlled?" In the Upper Passaic 201 Facilities Plan, non-point sources were already identified as having a major impact even if the POTW's were improved. Thus, we in North Jersey are perhaps somewhat ahead of others in identifying non-point pollutant impact, and would welcome an opportunity to work with the public and local officials to attain better controls, which would benefit our waterways.

WATER QUALITY STANDARDS

With the announcement by Administrator William Ruckelshaus recently, that the recommendations which had been promulgated earlier by EPA are being rescinded, we now believe the time has come for the Congress to establish a firm antidegrada-

tion policy for all waters of the United States. The premise must be the simple fact that water is an invaluable natural resource, and should be treated as such. Recently, in a discussion with a leading New Jersey pharmaceutical company, we were told that they don't need clean water: they need sterile water. Thus, it becomes quite meaningful that we must provide a high quality water supply if we want to retain productive and profit-making companies in our regions.

PROTECTION OF BAYS AND ESTUARIES

We welcome the section in Congressman Howard's bill which calls for the management of our bays and estuaries, and suggest that the lower Passaic and Newark Bay be placed as a major challenge under this format. This region has been dramatically degraded, and is beginning to show signs of recovery. Following the intent of the Clean Water Act, the reversal of estuarine and bay area pollution challenges our technology and the innovativeness of which we have been so proud during the past century.

Mr. Chairman, you and your Subcommittee have provided us, the citizens of New Jersey, with countless programs and processes whereby our Passaic River is moving towards once again being the Jewel of the East Coast, a working river with countless benefits for our citizens. We know of your own dedication to our river valley, and will work with you to assure that the goals of this important legislation are implemented, as the public wishes them to be.

Thank you for your time and courtesies.

THE RECORD (Bergen Passaic)
July 11, 1983

Passaic River's ebbing wetlands

By Rod Leith
Staff Writer

The Passaic River overflowed its banks, and the only escape for Florence Spatts was a makeshift wooden bridge between her front door and Horseneck Road.

Since she moved to her house beside the rolling Great Meadow in Fairfield 40 years ago, water has nearly consumed her property. The backyard pool collapsed and sank. Sealant applied to waterproof her basement oozed water.

The Great Meadow, like a good neighbor, once absorbed much of the water that spilled over the river's banks. No more. Development has gobbled up nearly a third of the Passaic River Basin's wetlands, which, like a heavily used sponge that frays around the edges, have lost much of their absorbency.

Development made flooding from this spring's heavy rains worse than usual in many basin communities. And, flood experts warn, further development of the wetlands would increase the severity of flooding even in a year of normal rainfall.

Despite this year's flooding, experts say residents of Wayne, Lincoln Park, Paterson, Little Falls, Totowa, West Paterson, Garfield, Lodi, and Saddle Brook can be thankful that rain did not come down this year as it did in 1977, when one storm caused $13.5 million in damage to properties in North Jersey.

Swollen insurance premiums

If communities suffer flooding, their property owners are also marked for high insurance premiums. Nationally, a homeowner pays an average of $140 a year for flood insurance; in Wayne, 703 policyholders pay about $200 apiece, or $141,200 annually in all. Mrs. Spatts remembers paying about $40 for her first year of coverage, but the average payment in Fairfield is now $255 a year.

"Without those meadows," said Clark Gilman, supervisor of the state Flood Plain Bureau, "there really isn't any [flood-control] plan."

"[The wetland] fills up like a bowl," said Marilou Bernard, a hydrol-

Passaic watershed faces increased flooding

Wetlands threatened by tide of development

ogy expert. "But the impacts of development have caused it to flood higher, faster, and for longer durations."

Traveling on Route 80 through Passaic and Morris counties, a motorist gets a panoramic view of much of the development of wetlands. Willowbrook Mall in Wayne and massive commercial and residential construction in Fairfield took pieces of wetland in Passaic and Essex counties. Further south, in watershed land outside the Great Swamp National Refuge, the landscape is dotted by hundreds of town houses and condominiums off Route 287.

Wildlife has suffered along with property owners. Across Route 80 from Mrs. Spatts's Fairfield home, deer were recently trapped by water that spilled over the Passaic's banks. Some were able to climb the embankment of the highway, but 25, some of them pregnant does weakened by lack of food, died.

Some federal wildlife officials and environmentalists warn that uncontrolled development is destroying irreplaceable habitat and threatening endangered wildlife.

Officials at odds

In the last year, the development issue has pitted officials of the Reagan administration against one another.

On one side of the controversy are Col. Walter M. Smith Jr., who, until June 30, headed the U.S. Army Corps of Engineers' New York office, and Assistant Army Secretary William R. Gianelli.

Smith was in large part responsible for allowing development on the wetlands over the last three years, and Gianelli wants to further relax wetland development rules enforced by the Corps of Engineers. Gianelli's proposals would speed the process of applying to build on wetland by reducing the amount of land controlled by the corps and by eliminating many of the avenues for objecting to development.

On the other side, officials of the U.S. Department of the Interior and members of several environmental organizations say the Army Corps, while charged with saving North Jersey from flooding, has stood by while development increases flood damages.

One official of Interior's Fish and Wildlife Service claims that Gianelli's proposed wetland rules could have dire consequences for the open marsh and swampland of North Jersey's Passaic River Basin. "If they [the rule changes] go through," he said, "the result will push us out to the coast."

State regulations proposed

Legislation introduced last week in the state Senate and Assembly would regulate wetlands now unprotected. If the legislation is adopted, New Jersey would join New York, Michigan, Wisconsin, and a few other states with such rules. However, until the state takes control, the Army Corps regulations and Assistant Army Secretary Gianelli's reforms are the future.

The Army Engineers, charged with saving North Jersey from flooding, have been accused of standing by while development increases flood damages.

The Corps of Engineers has been studying the Passaic River since Mrs. Spatts and her late husband, Albert, moved from a rented Belleville apartment to their home in 1943. Forty years and five unsuccessful flood-control plans later, the agency now believes that wetlands may have to be purchased to be preserved.

"Preservation could be critical if we choose certain structural [flood-control] alternatives, like tunnels," said Robert Callegari, chief of the corps's Passaic River Study Group. The current plan includes a recommendation to spend as much as $120 million to buy about 13,000 acres of wetlands, Callegari said. The land could be purchased by the U.S. Department of Interior, or New Jersey through the Green Acres program.

"We have to ask what kind of dangers are we preventing if we buy," he said.

The Passaic River Basin study, which has cost $15,878,000, may answer that question. The study was ordered by Congress in 1977 and is due to be completed by mid-1984.

Meanwhile, Army Corps planners estimate that development has occurred over 6,000 acres of Passaic River Basin wetlands since 1940. The Department of the Interior, however, says the corps's estimate is far too conservative. The agency estimates that the Passaic River Basin had more than 70,000 acres of wetlands in 1960 and that about 22,000 have been lost. [See related article.]

"We do not expect the rate of habitat losses to be reduced in the near future," said Assistant Interior Secretary Ray Arnett in a 1982 letter protesting development of wetlands in the Passaic River Basin. "In fact, we expect the opposite," he said, forecasting that another 125 acres of wetland would be lost through development in Morris County.

Various factors

Development of wetlands has occurred because of a number of factors:

- Construction of three major highways in North Jersey, Routes 80, 287, and 280, all of which cut through wetlands. Land-use authorities say these highways, in addition to causing thousands of acres of swamp and marshland to be filled for their construction, have made once-fallow land valuable.
- Local officials, concerned with broadening their communities' tax bases, have developed master plans and zoning codes that encourage industrial, commercial, and residential uses for land designated as wetlands.

Most of North Jersey's wetlands are zoned for development, except for a large section of the 3,100-acre Troy Meadow in Parsippany, which

is owned by Wildlife Preserves, and the 6,800 acres of the Great Swamp National Wildlife Refuge. Unless and until state inland wetlands legislation is enacted, restrictions on development in much of the Passaic River Basin must depend on municipal zoning ordinances.

● Corporate and private property owners, land speculators, and build-effects of development can be balanced by more tax ratables, better roads, and improved municipal services.

When the Prudential Insurance Company proposed filling 200 acres of Lee Meadow in Parsippany in Morris County, for example, local officials were persuaded that the impact on the environment would be minimal and that the development would vastly improve road transportation.

● If development of wetlands is environmentally questionable, it is not necessarily illegal.

Assistant Secretary Gianelli outraged environmentalists and federal wildlife officials by refusing to bar the Army Corps from permitting a substantial town-house development near the Great Swamp in Harding Township. And he has now proposed sweeping changes to streamline the wetland permit program.

Among the proposed changes is a provision that would exempt such federally financed projects as highways, sewerage projects, and dams. A new definition of wetland would exclude bottomland hardwoods and shrub bogs. The proposals call for requiring only "letters of permission" for certain filling and dredging activities.

The result, environmentalists say, would be further erosion of the wetlands in New Jersey and across the nation. The Gianelli proposals could foreclose the public's right to comment and bar federal and state wildlife and environmental agencies from reviewing and objecting to development projects short of going to court, they say.

Streamlining the permit program, Gianelli counters, is part of the Reagan administration's move "to have government stand by the people's side, not ride on their backs."

Developers favored

Environmental groups and officials with the Interior Department cite New Jersey as an example of where wetland enforcement favors developers. At the center of the controversy is Colonel Smith, the former Corps of Engineers' New York District chief engineer, who retired June 30 to take a job with Hartz Mountain Industries.

Local officials, concerned with broadening their communities' tax bases, have developed master plans and zoning codes that encourage industrial, commercial, and residential uses for land designated as wetlands.

Five major environmental groups have challenged the permission granted Hartz Mountain Industries to fill nearly 200 acres of wetland in the Hackensack meadowlands. The Environmental Defense Fund and other groups say Smith, who approved the Hartz permit in January, should have required the company to do a more extensive environmental review.

In the case of the Prudential proposal to fill half the wetlands in Lee Meadow, Smith decided to issue a so-called nationwide permit, a move that precluded public comment and input from other agencies. Among other things, Smith determined the loss of 200 acres in Lee Meadow to be "less than four tenths of 1 percent of the wetlands area of the Passaic River Basin."

"Each of the [development plans affecting wetland] that come before me are small relative to total capacity," said Thomas M. Creamer, chief of the Army Corps's construction permit branch in New York. "Each of these little things are not significant unto themselves."

Prudential opposed

A different view is taken by Kenton R. Inglis, acting state conservationist for the U.S. Department of Agriculture, who argued against Prudential's project. "This wetland is only a small percent of the total wetlands in the river basin," he explained. "However, because of past losses of wetlands in the basin, we feel it essential that the remaining wetland areas be recognized for their beneficial values."

Florence Spatts has witnessed the diminution of one of those wetlands. From her back window, she watched as thousands of tons of rock filled the wetland to support six lanes of superhighway when Route 80 was built through the Great Meadow. More recently, she has seen truckload after truckload of soil taken from the meadow. She complained, she says, but her problem was considered too small, too insignificant.

Now, Mrs. Spatts looks out past her backyard at a large wooden billboard in the midst of the impounded water. It announces that commercial and industrial developers are welcome to buy tracts of 2,000 and 4,000 square feet.

"I guess I'm in the same category as those people you read about along the Mississippi," said Mrs. Spatts, a widow who raised three daughters in the house on Horseneck Road. "I'd like to stay," she said, recalling when her children played in the backyard and the meadow was strong enough to support wagons full of hay. "But I'm giving up."

Passaic's wetlands: How much are left?

The Army Corps of Engineers estimates that 18,100 acres of wetlands remain intact in the Passaic River Basin, excluding the 6,800 acres of protected wetlands inside the Great Swamp National Wildlife Refuge. The estimate, however, clashes with calculations by Dr. Eugene Vivian, a consultant for the U.S. Department of the Interior.

Vivian, an environmental scientist who teaches at Glassboro State College, said that a closer examination of development in the central Passaic basin's wetlands — those tracts of crucial importance to flood control in downstream communities in Passaic and Bergen counties — shows that almost 4,000 of the 12,000 acres estimated by the Army Corps to be undisturbed have been consumed by roads, airports, sewerage plants, industrial and commercial buildings, and housing.

In 1962, before Route 80 was built, Army Corps flood planners underscored the importance of preserving the Great Meadow, then the largest of the central basin wetlands. Their report said the natural water storage provided by the Great Meadow had saved much of the downstream sections from being devastated by storms.

"The past security of the Passaic River Basin against catastrophic floods," the report said, "was entirely dependent upon availability of the Great Meadow and adjacent areas for natural retention storage."

1979-80 survey

The most recent government survey of Great Meadow and six other Passaic basin wetlands was done in 1979-80 by Vivian and other specialists with the Interior Department's Fish and Wildlife Service. That survey showed a total of about 12,000 acres, but it failed to specify how much of that acreage had been lost to development allowed by the Army Corps.

Vivian recently provided The Record with an accounting of the wetlands still open, or undisturbed. They total 8,047 acres, comprised of:

- Great Meadow, 4,275 acres, of which 40 percent has been lost to Route 80 and development on its fringes, including extensive construction in Fairfield. About 2,565 acres are undisturbed. (Great Meadow was renamed Little Piece Meadow and Great Piece Meadow after Route 80 was built in 1968.)
- Troy Meadow, 3,100 acres, of which 20 percent has been lost to development and utilities, leaving about 2,480 acres undisturbed.
- Hatfield Swamp, 1,870 acres, of which 40 percent has been lost to development, Route 280, other road construction, and a sewerage treatment facility and other utilities, leaving about 1,122 acres undisturbed.
- Black Meadow, 1,200 acres; 40 percent has been lost to Morristown Airport and utilities, leaving about 800 acres undisturbed.
- Bog and Vly Meadow, 900 acres; 20 percent has been lost to Lincoln Park Airport and general development, leaving about 720 acres undisturbed. (If the Frassetto Group of Hackensack is permitted to fill an additional 200 acres, Bog and Vly Meadow will be reduced to about 520 acres.)
- Lee Meadow, 400 acres; 30 percent has been lost to development, leaving about 280 acres undisturbed. (If the Prudential Insurance Company is permitted to fill an additional 200 acres for development, Lee Meadow will be reduced to about 80 acres.)
- Long Meadow, 262 acres; 70 percent has been lost to industrial and residential development and road construction, leaving about 80 acres undisturbed. (The federal Department of Housing and Urban Development has approved a $1.6-million grant for industrial construction by the Essex County Improvement Authority on 70 of the undisturbed 80 acres, though construction depends on the Army Corps's approval of a fill permit.)

— ROD LEITH

TESTIMONY ON THE CLEAN WATER ACT BY JANE NOGAKI

My name is Jane Nogaki and I am from Evesham Township, New Jersey. I'd like to thank Congressman Howard for introducing the Clean Water Act. No one needs clean water more than we do in New Jersey.

My part in the New Jersey Clean Water Campaign testimony has to do with how a strong Clean Water Act will help small communities like Evesham Township.

Parts of our township are experiencing ground and surface water contamination by nitrates. These problem areas involve developments that have individual septic systems for waste disposal and relatively shallow wells for drinking water (70-100 feet).

Because of the Pinelands nature of the soil—sandy, highly permeable, execessively well drained, nitrates from septic tanks and lawn fertilizer or farm fertilizer migrate through the soil downwards to the subsurface aquifer, and sideways to surface waters. Our recreational lakes are choked with weeds, indicative of high nitrogen and phospate loading from run-off and leaching.

In my particular development, called Marlton Lakes, nine homeowners have wells with nitrate levels above the acceptable drinking water standard of 10 ppm. Thirty-three wells in the area showed nitrate levels of between 5—9.99 ppm. Considering that the ambient level of nitrates in the pine barrens is twoppm, we can see that development has overtaxed our surroundings' ability to attenuate nitrates in ground and surface waters. This loss affects our health and threatens property values. The demoralizing factor that accompanies the knowledge that we are fouling our own nest is overwhelming.

Our civic association requested help from the township in assessing our problem. Our Town Council authorized the Township Municipal Utilities Authority (MUA) to explore the feasibility of a public water supply to the southern end of the township and establishing a septage management program to amerliorate the ongoing nitrate pollution.

In August, 1983, the Evesham MUA hired a consulting firm to identify the extent and severity of water pollution problems related to the operation of septic systems in our town. The consulting firm is sampling well, stream and lake water in the unsewered areas of the township. After identifying problem areas, Princeton Aqua Science will suggest solutions. The solutions will consist of localized methods of wastewater treatment such as the construction of neighborhood septic systems or the repair of existing septic systems using state of the art technology. It is hoped that the study and repairs will be eligible for grant funds under a special USEPA and N.J. DEP program for innovative and alternative approaches to waste management in small communities, which is funded under Section 201 of the Clean Water Act.

The Evesham MUA is also applying for funds under the Clean Water Act to rehabilitate an old part of the existing sewer system in the northern section of town (Major Source System Rehabilitation).

It is vital to ground and surface water quality that small towns and rural areas get a share of the funds. Relatively small investments can yield positive results in preventing further water degradation. Towns like Evesham that do not have a large tax base will not be able to afford these innovative programs without the help provided for in a fully funded Clean Water Act.

I and my citizens group, Coalition Against Toxics, support all parts of the proposed Clean Water Act, but we are particularly interested to see that a provision is made for mandatory controls over non point source pollution, such as run off from farmlands and roadways. Our group formed in order to prevent human exposure to pesticides and to protect surface and groundwater from pesticide contamination. I submit to you a news article about the pesticide contamination of a nearby lake, Strawbridge Lake in Moorestown, New Jersey. Strawbridge Lake has long been the focal point of the Moorestown community and is probably the most photographed lake in southern New Jersey. The waters have been contaminated by runoff of pesticides—chlordane in this instance.

Since agriculture is a major land use in southern N.J., pesticide and fertilizer runoff needs to be controlled. According to the National Wildlife Federation, non source point pollution accounts for half of the nation's water pollution.

[From the New Jersey Courier-Post, Apr. 8, 1983]

AREA FISH WARNING RENEWED

(By Bernie Weisenseld)

The State Department of Environmental Protection (DEP) has renewed its 4-year-old warning against eating fish caught in several streams and lakes in Burlington, Camden and Gloucester counties because of possible contamination by the pesticide chlordane.

The warning applies to the Cooper River, the northern and southern branches of Pennsauken Creek, Strawbridge Lake in Moorestown, and Woodbury Lake and Steward Lake in Woodbury, said DEP spokesman James Staples.

Signs are being posted at those locations to coincide with the opening of trout fishing season tomorrow, Staples said.

"These are not trout waters, but the mere fact that trout season has opened raises everybody's consciousness" about fishing, he added.

Tests of fish taken from the affected streams and lakes in 1981 and 1982 found levels of the pesticide chlordane at levels higher than permitted by the U.S. Food and Drug Administration, Staples said.

Heavy doses of chlordane can cause immediate damage to the brain and nervous system and can bring about muscle spasms, behavioral changes, organ degeneration and death.

Developed 40 years ago, in 1978 the pesticide was declared a carcinogen and banned by the federal government from all uses except below-ground application for termite control.

"When you inject something into the ground, you're heading right to the nearest fish," said Staples.

State health and environmental protection agencies began a program of testing fish in area waterways when concentrations of chlordane appeared in Strawbridge Lake and the upper portions of Pennsauken Creek in 1978.

The source of contamination initially was thought to be a Mount Laurel garden supply store where 30 gallons of chlordane was washed into Strawbridge Lake, but subsequent tests indicated chlordane may have been entering the lake from some other source and may have been in the lake longer than previously suspected.

A persistent chemical, chlordane can remain active in soil and sediment at the bottom of waterways for many years.

COALITION AGAINST TOXICS

David C. Copeland, Chairman; Jane Nogaki, Secretary; Wynne Falkowski, Treasurer; Stephen Flakowski, Medical Consultant; Rodger Nogaki, Safety Consultant.

Informed choices can be yours!

Contact CAT for information on:

Pesticide health effects and precautions to prevent exposure;

Protecting your rights from chemical trespass;

Implementing a biological control program in your town or neighborhood.

If your town governing body or your civic association would like to hear our presentation on biological control of the gypsy moth, contact 767-1110 to set up a meeting date.

To become a member of CAT, send $10 to: Wynne Falkowski, 31 Coventry Circle West, Marlton, NJ 08053.

It is the goal of CAT to work for a statewide restriction on the aerial application of broad-spectrum pesticides over residential areas, and to see that strict regulations regarding ground spraying are enacted by New Jersey Department of Environmental Protection to prevent drift onto neighboring properties.

In February 1983, Evesham Township enacted an ordinance prohibiting the aerial application of broad-spectrum pesticides over non-agricultural areas, Connecticut has had a similar policy since 1972. Other nearby states such as Delaware, Pennsylvania, and Massachusetts are funding only biological sprays for control.

A related issue that we are working on is the renewal of a strong Clean Water Act and Safe Drinking Water Act. In addition we have lobbied to support:

The "Right-to-Know" Act.

NJ Birth Defects Registry.

Drinking Water Testing Act.

FIFRA Reform Act.

New Jersey organizations with whom we cooperate:

NJ Citizen Action.
NJ Clean Water Campaign.
Association of NJ Environmental Commissions.
NJ Coalition for Alternatives to Pesticides.
Southern New Jersey Perinatal Cooperative.
Burlington County Department of Health.

Coalition Against Toxics (CAT) was formed in May 1982, by citizens from twelve towns who were interested in uniting their efforts and experiences in promoting biological control of the gypsy moth rather than relying on potentially harmful chemical means.

The founders formed a network with environmental commissions and private citizens from Medford, Medford Lakes, Evesham, Cherry Hill, Moorestown, Mount Laurel, Willingboro, Tabernacle, Shamong, Berlin, and Waterford to coordinate providing information on safe and effective gypsy moth control to township councils and neighborhood associations.

Using Evesham Township's positive experience with B.t. (Bacillus thuringiensis) for control of gypsy moth over a three year period, Coalition members spoke to ten towns in the fall of 1982, urging them to try using biological control methods. All ten towns cooperated.

We believe that the reduction of human exposure to broad spectrum pesticides is a worthwhile goal that can be accomplished through education and citizen awareness of choices in the use of pesticides.

Mr. ROE. Please proceed.

TESTIMONY OF VIVIEN LI, CHAIR, NEW JERSEY CHAPTER OF THE SIERRA CLUB; RAYMOND D. BOGAN, UNITED BOATMEN'S ASSOCIATION; ELLA FILIPPONE, PASSAIC RIVER COALITION; JANE NOGAKI, COALITION AGAINST TOXICS

Ms. LI. Mr. Chairman, and members of the subcommittee, thank you for inviting us here today. My name is Vivien Li. I chair the New Jersey chapter of the Sierra Club, which is made up of more than 9,000 members from the State of New Jersey.

We are part of the national Sierra Club comprised of 364,000 members nationally.

The Sierra Club, together with 30 other organizations in the State, are a part of the New Jersey Clean Water Campaign. Members on the panel here are representatives from various organizations that are representative of the groups.

Other groups that are part of the campaign, including the League of Women Voters of New Jersey, Utility Contractors of New Jersey, the South Monmouth Board of Realtors, Clean Ocean Task Force, Concerned Citizens of Wayne, and as I said, approximately 30 organizations total.

There are many people who are concerned about clean water. Unfortunately, all of them cannot be here today. We have petitions of 20,000 people who we canvassed over a several week period who wanted to express to the committee their concern for clean water.

These petitions were gathered as part of a major grassroots campaign, New Jersey and also nationally, to focus attention upon the important work that this committee is doing.

Over Labor Day weekend, we walked the beaches of the State of New Jersey to get some of these petitions signed and also to let people know exactly what you are doing and how very important the work of this committee is.

So I think all of them, as well as people we could not reach during that particular weekend, support your efforts. I think as we

look back at what has happened between 1977 and today, we have clearly made a great deal of progress.

But much more needs to be done. If we look, for instance, in terms of industrial sources, approximately 80 percent of industrial sources in New Jersey are currently meeting the requirements of the clean water Act, but only 60 to 70 percent of the industrial flows are actually in compliance with the law.

In other words, some of the big sources still are not yet on line. I think that is what you have been talking about during your hearings.

So there remains still a great deal to be done. But we again support many of your efforts, and I think that each one of us will identify specific parts of the act that we would like to comment on.

So I am going to turn it over to the panel now. We have made a pledge among ourselves that we are going to try to each only speak 5 minutes so that it will give you some time to ask questions and hopefully we can keep you on schedule.

So I am going to act as timekeeper.

Mr. ROE. Suppose what we do now is all of the testimony of the four panelists will be included in full in the record. Then you can proceed from there.

Ms. LI. Fine.

The first speaker will be Ray Bogan with the United Boatmen's Association. He is also the cochair of the New Jersey Clean Water Campaign.

He will talk about how important this bill is in terms of the boating industry and recreational industry.

Mr. ROE. Mr. Bogan.

Mr. BOGAN. Mr. Chairman, thank you. I was not on the plane in time, so I didn't know there was a 5-minute limit, so I will read real quickly.

Mr. ROE. We will give you an extra minute or two.

Mr. BOGAN. I will just read off the testimony here. Again, my name is Raymond D. Bogan. I am here to speak on behalf of the United Boatmen of New Jersey and the Jersey Coast Angler's Association.

I am here to testify on H.R. 3282, the Water Quality Renewal Act. In explaining why we support H.R. 3282, I will try to concentrate on our fishing industry and how it is adversely affected by water pollution.

I will explain why we feel H.R. 3282 is the best legislation to fight the threat of water pollution and to clean up presently polluted waters.

Clean water affects the shore economically and recreationally. It also affects the physical well-being of those who swim in it, work on it, and eat food taken from it.

In New Jersey, the recreational fishery brings some $550 million into the State. The commercial fishery brings in approximately $485 million—information provided by the State Division of Fish and Game. And that includes incidental businesses, though it excludes certain other types of recreational boating endeavors such as diving which would be affected by pollution also.

The fishing industry, as well as the rest of the much larger tourism industry of which it is a part, is hurt by pollution and threatened by laws which are lax in water pollution control.

Specific instances where our industry has been injured by water pollution, juxtaposed with the features of the bill in question, will explain why the organizations I speak for back H.R. 3282 and its tough stand on water pollution.

The bill sets stricter deadlines for industries to reduce discharges of toxic wastes. A big thing in New Jersey right now is that the warnings on toxic heavy metals and other cancer-causing agents are becoming more prevalent.

Fin rot—a progressive distruction of fin tissue in certain bottom dwellers—has been shown to be directly related to pollution by toxic waste and sewage.

The New Jersey Department of Environmental Protection has been mandated to put out releases every 6 months on the potential health hazard of PCB's in bluefish, striped bass and eels.

A little aside—this is kind of a bright spot insofar as to see what legislation has done so far. Within the last 5 years I have been told by the Food and Drug Administration that the level of PCB's seems to be going down.

I think that is a good sign of what cutting down on toxins can do. These fish, and bluefish account for almost 50 percent of the recreational fishery. It is a $550 million industry.

That is pretty substantial, especially in a State like ours, tourism-wise.

The bill places tighter controls on the discharge of poorly or nontreated sewage by municipalities into the ocean. Here I will give a couple of examples of places you can see the effects of raw sewage going into the ocean.

A few years ago it was common during the winter months for scuba divers who dive for their livelihood as well as recreationally to tell of the effects of municipal pumping of untreated sewage on in-shore wrecks and rock piles, the habitat of many fish.

They would tell of scenes where dead lobsters would be piled up to a foot high in these habitats and where fish would be suspended dead off the wrecks as a result of the sewage pumping. It is a pretty hard site.

I don't dive, but I have a couple brothers who dive. To say you can take pictures of it is kind of difficult because there is usually only two to three foot visibility if there is heavy dumping going on, if that.

But it is pretty hard. That is sewage dumped right offshore by municipalities. There are times when municipalities, when they have heavy rain falls, to let off some of the pressure they just shoot off raw sewage.

We had in 1976 a terrible fish kill. In that fish kill the Department of Environmental Protection National Marine Fishery Service through their branch at Sandy Hook agreed that it was caused by low levels of oxygen.

What they said off the record to us and many other fishermen as the reason for it was because of sewage and certain chemicals going into the ocean and lack of oxygen. In a dump off Ambrose Light Tower, that is off of Brooklyn, Coney Island, that area, 6

miles approximately from the light tower, barges go out and they dump, open up their doors and dump sewage out there.

That area is pretty much a dead sea in terms of fish dwelling. There are fish that will migrate through it, but you won't have fish that will stick in that area, where once you had a lot of whiting, a lot of food fishes that would stay in that area.

The increase of funding for sewage treatment plant construction would help in instances where the municipalities are forced to pump sewage into the ocean.

Another aspect of the tourism industry as it relates to the ocean can be seen in recreational scuba diving. This activity provides employment for those who cater to the recreational diver. That is becoming a lot bigger. You will see people moving down, all the coastal States moving down, hitting wrecks. Just to give you an idea of how pollution would affect a business like that, you see one case where the boat called the *Sister Rib* is a diver and hits wrecks up and down the Jersey coast. He and 12 others were diving off a wreck pretty close to the dump site.

It is an excellent location for diving because it is pretty neat to see. Unfortunately, after coming out of the water all the divers experienced ear, eye, and throat infections, skin rashes and two of the women experienced bacterial and fungal infections.

You can see bright spots. I mentioned one. Another—of legislation which helps clean up the water. As I said, where model sewage treatment plants have been installed and where they are being used and any kind of pumping would go on, we can't see through our experience, namely, the amount of fish in a particular area and divers' reports, we can't see where there is any serious harm to the environment through advanced sewage treatment plants.

So to wrap it up, that is why we support H.R. 3282, mainly because of the strong stance it takes. We don't feel it is just a good thing to have a strong stance on water pollution.

It is absolutely necessary, because if we don't have it, we are gone. The whole industry is gone and it is not out of the question now either.

I am not sitting here saying, oh, a terrible thing is going to happen. I have already seen it with the PCB warnings. Our business has dropped 50 percent on the blue fishing.

To be in this business and have a mortgage on the boat, our family, we have a number of boats, even us, we are being hurt by it. You can imagine a guy who concentrates on bluefish how he is affected by it.

So it is not just something that would be nice to have. It is absolutely essential. The tougher the standards the better.

Although there are certain hardships, we do need these strong standards and we think H.R. 3282 handles these in the best manner possible. Thank you.

Mr. ROE. Thank you.

Ms. LI. The next speaker will be Ella Filippone of the Passaic River Coalition. She will speak on how the bill will affect the Passaic River Basin.

Ms. FILIPPONE. Mr. Chairman, I appreciate the opportunity to be here this morning. I am pleased to be here representing northern New Jersey, and we are very pleased always to send back to Con-

gress our very prominent chairman. Some tell me he is the only one who knows more about the Passaic Valley than I do.

Mr. ROE. They are probably right.

Ms. FILIPPONE. We would be hardpressed to find a constituency anywhere else in the United States which supports the Clean Water Act with more vigor than those in the Passaic River Valley. Since the founding of this Nation, this relatively small river system has provided industry and the public with water resources which brought northern New Jersey to the economic standing which it holds today. Unfortunately, during the early years of this century, disregard of the impact of pollution discharges caused this watershed to be considered one of the 10 most polluted river systems in the Nation; it has been described as "New Jersey's most maligned public servant."

Since the passage of the Federal Pollution Control Act Amendments of 1972, water quality has begun to improve, and we want to see that positive course continued. The public support of clean water efforts has been seen over and over again: thousands of petitions in the mid-1970's for the Passaic to be the model river; thousands of letters and phone calls to stop dumping into the river by a major sewer authority with a break in its interceptor; continuous overwhelming support for State bond issues related to water resources.

Thus, the introduction of H.R. 3282 by Congressman James Howard is perceived as furthering this program's assurances to the citizens of northern New Jersey that improvements toward water quality can be a reality and not just a distant goal. We greet this bill with very strong support.

We have consistently supported a well-funded construction grants program, so as to substantially improve water quality in our river systems. In implementing the construction grants program, we urge Congress to place the highest priority on those facilities which discharge into potable drinking water supplies. While an emphasis existed for the allocation of funds to facilities in the urban area, the focus should be on facilities which impact waters used by the urban areas.

For example, in our watershed, the most urban area—Newark, Paterson, Passaic—is serviced by a facility which discharges into upper New York Harbor, affecting to some degree the coastal waters. However, Paterson and Passaic receive their drinking water supply from the upper Passaic, which still has several projects which are not even close to the implementation stage on New Jersey's priority list. Such facilities have a direct impact on public health.

Another component of the construction grants program which should have more visibility and accountability is the projected improvement to water quality for the expenditure of funds. This type of assessment has been done in New Jersey for industrial discharges and should be required for POTW's also. The public should be informed of the anticipated improvement in water quality. A commitment, actively pursued, should be made by the States to insure compliance with waste water management plans.

Recently, for example, we were involved with an extremely difficult evaluation on the reestablishment of an industrial facility on

the Whippany River, a major tributary to the Passaic which has limited flow at best. Several years ago, under 201 planning, the Morristown facility—built in 1911—was removed from the long, drawn-out planning process to expedite an expansion and upgrading to tertiary treatment. The expansion occurred but the advanced waste treatment did not. This element is a low priority on the State's list; yet lack of this improved treatment will have impacts on the public health and economic needs of the region. We need better management and accountability from the Environmental Protection Agency and the States on the construction grants program.

We in the Passaic River Valley strongly support the maintenance and strict adherence to section 404 related to the filling of our Nation's wetlands. We are enclosing, as an exhibit, an article by Rod Leith of the Bergen Record, which reports on the extensive losses of inland wetlands within our watershed. We recognize that this part of the Clean Water Act cannot do all things. However, in addition to controlling fill, the disturbance of the wetlands by soil movement, mining, and alteration of habitat should be a part of this section.

Furthermore, other Federal agencies which provide funds for needed programs and projects should require full conformance with section 404 prior to application for funds. In that manner, an applicant will know what is expected and may act accordingly. When, for example, a large UDAG grant is awarded for development in a riverine wetland, which clearly should not be allowed, considerable frustration and the expenditure of resources on the part of the applicant may occur. Such situations could be avoided if the applicant knew beforehand of the 404 program and the probable degradation resulting from the proposed development. In the case of the Passaic River Central Basin, these waters are drinking water supplies for a majority of northern New Jersey, and have enormous value for flood control.

Uniform national standards are the only equitable manner in which to deal with the pretreatment program. The effluent at the end of the pipe and the sludge disposal programs are contingent on a uniform national program. The ultimate goal must be the removal of hazardous substances such that the disposal of the residue at the plant, either as effluent or as sludge, is not jeopardized. Within the paramaters of the pretreatment program, consideration should be included on the reuse of substances removed from the waste stream, as has been done in various European programs. This type of function gets back to a management program, which provides the incentives for a waste exchange.

The sludge management program has floundered because of lack of a comprehensive program which deals with: One, sludge content; two a comprehensive pretreatment program; and three, volume considerations. The threat to water resources from the lack of a program is mind-boggling in the Passaic River Basin. Sludge management must be planned and implemented on a regional basis. We cannot allow small storage areas to proliferate throughout a watershed. If guidelines were established through an extensive public participation program, such as the 208 Policy Advisory Committee process, an equitable program could be developed.

When the Northeast New Jersey Wastewater Management Policy Advisory Committee was active, sludge management had a high priority and was to be undertaken as an issue for review during the continuing planning process. Unfortunately, this process was eliminated. Although some 208 programs in the Nation were not successful, we in northern New Jersey had established an active committee of 70 representatives which developed consensus and better understanding on difficult issues.

On nonpoint sources, the only possible process which can control nonpoint sources of pollution is one which ultimately places the burden of enforcement on the local level. The basic decision on what is or is not permitted may be done on the Federal/State level, through guidance and technical assistance but the ultimate responsibility is at the source. In that regard, a major step forward would be a broad-based education program to inform the public on "What is nonpoint pollution? Where does it come from? How can it be controlled?" In the Upper Passaic 201 Facilities Plan, nonpoint sources were already identified as having a major impact even if the POTW's were improved. Thus, we in north Jersey are perhaps somewhat ahead of others in identifying nonpoint pollutant impact, and would welcome an opportunity to work the public and local officials to attain better controls, which would benefit our waterways.

With the announcement by Administrator William Ruckelshaus recently, that the recommendations which had been promulgated earlier by EPA are being rescinded, we now believe the time has come for the Congress to establish a firm antidegradation policy for all waters of the United States. The premise must be the simple fact that water is an invaluable natural resource, and should be treated as such. Recently, in a discussion with a lending New Jersey pharmaceutical company, we were told that they don't need clean water: they need sterile water. Thus, it becomes quite meaningful that we must provide a high quality water supply if we want to retain productive and profitmaking companies in our regions.

We welcome the section in Congressman Howard's bill which calls for the management of our bays and estuaries, and suggest that the lower Passaic and Newark Bay be placed as a major challenge under this format. This region has been dramatically degraded, and is beginning to show signs of recovery. Following the intent of the Clean Water Act, the reversal of estuarine and bay area pollution challenges our technology and the innovativeness of which we have been so proud during the past century.

Mr. Chairman, you and your subcommittee have provided us, the citizens of New Jersey, with countless programs and processes whereby our Passaic River is moving toward once again being the jewel of the east coast, a working river with countless benefits for its citizens. We know of your own dedication to our river valley, and will work with you to assure that the goals of this important legislation are implemented, as the public wishes them to be.

Thank you for your time and courtesies.

Mr. ROE. Very well.

Ms. LI. The next speaker is Jane Nogaki from the Coalition Against Toxics. She will speak about how the act affects the small local community.

Ms. NOGAKI. Thank you. Mr. Chairman, members of the House Water Resources Subcommittee, my name is Jane Nogaki and I am from Evesham Township, N.J. I would like to thank Congressman Howard for introducing legislation to reauthorize and strengthen the Clean Water Act. No one needs clean water more than we do in New Jersey. We are the largest producer of hazardous wastes and have the largest number of dumpsites. Evesham was one of the first cleaned up, by the way, and is not a very dangerous site. It was an easy one.

My part in the New Jersey Clean Water Campaign testimony has to do with how a strong Clean Water Act will help small communities like Evesham Township.

Parts of our township are experiencing ground and surface water contamination by nitrates. These problem areas involved developments that have individual septic systems for waste disposal and relatively shallow wells for drinking water—70 to 100 feet.

Because of the Pinelands nature of the soil—sandy, highly permeable, excessively well drained—nitrates from septic tanks and lawn fertilizer or farm fertilizer migrate through the soil downward to the subsurface aquifer, and sideways to surface waters. Our recreational lakes are choked with weeds, indicative of high nitrogen and phosphate loading from run-off and leaching.

In my particular development, called Marton Lakes, nine homeowners have wells with nitrate levels above the acceptable drinking water standard of 10 parts per million. They are not drinking their water. Thirty-three wells in the area showed nitrate levels of between 5 and 9.99 parts per million. So they are approaching their maximum number. Our well is a 5.

Considering that the ambient level of nitrates in the pine barrens is 2 parts per million, we can see that development has overtaxed our surroundings' ability to attenuate nitrates in ground and surface waters. This loss affects our health and threatens property values. The demoralization factor that accompanies the knowledge that we are fouling our own nest is overwhelming.

Our civic association requested help from the township in assessing our problem. Our town council authorized the Township Municipal Utilities Authority to explore the feasibility of a public water supply to the southern end of the township and establishing a septage management program to ameliorate the ongoing nitrate pollution.

In August 1983, the Evesham MUA hired a consulting firm to identify the extent and severity of water pollution problems related to the operation of septic systems in our town. The consulting firm is sampling well, stream and lake water in the unsewered areas of the township. After identifying problem areas, they will suggest solutions. The solutions will consist of localized methods of wastewater treatment such as the construction of neighborhood septic systems or the repair of existing septic systems using state of the art technology. It is hoped that the study and repairs will be eligible for grant funds under a special USEPA and N.J. DEP program for innovative and alternative approaches to waste management in small communities, which is funded under section 201 of the Clean Water Act.

20-955 O—84——71

The Evesham experience, if we get these funds and could use the technology, will serve as a model to small areas like ours. Our town is also applying for funds under the Clean Water Act to rehabilitate an old part of the existing sewer system in the northern section of town—major source system rehabilitation.

It is vital to ground and surface water quality that small towns and rural areas get a share of the funds. Relatively small investments can yield positive results in preventing further water degradation. Towns like Evesham that do not have a large tax base will not be able to afford these innovative programs without the help provided for in a fully funded Clean Water Act.

I and my citizens group, Coalition Against Toxics, support all parts of the proposed Clean Water Act. But we are particularly interested to see that a provision is added to the bill for mandatory controls over nonpoint source pollution, such as runoff from farmlands and roadways. Our group formed in order to prevent human exposure to pesticides and to protect surface and ground water from pesticide contamination. I submit to you a news article about the pesticide contamination of a nearby lake, Strawbridge Lake in Moorestown, N.J. Strawbridge Lake has long been the focal point of the Moorestown community and is probably the most photographed lake in southern New Jersey. The waters have been contaminated by runoff of pesticides—chlordane, in this instance.

Since agriculture is a major land use in southern New Jersey, pesticide and fertilizer runoff is a reality. It has been going on for a long time and needs to be addressed. It needs to be controlled, and the controls need to be mandatory. According to the National Wildlife Federation, nonsource point pollution accounts for half of the Nation's water pollution.

I don't have the expertise to describe methods to control this but I know at a local level our planning board is implementing the strategy such as storm water management, planting of grasses along edges of farmlands, not fertilizing, not using pesticides along the outermost edges of fields where water runoff would occur into streams. These kind of resources can be used.

Finally, I would like you to know that as the Secretary of a very small citizen organization that formed to improve water quality in our area, the citizen awareness of this water quality issue is very large. I have never seen an issue around which so many people could rally. No one that I have shown a petition to and asked them to sign has said, "I don't want it." Everybody wants it. Everybody wants clean water and they are starting to learn how they can participate in the system of getting it. They are forming groups like ours and speaking up in their towns and saying, we think the water quality in our town could be better. What can we do to get it? And that is why we formed.

So I thank you very much for this opportunity to testify, and hope that you will approve a very strong bill.

Mr. ROE. Thank you.

Ms. Li.

Ms. LI. If you will let me just speak for a few minutes on section 404.

Mr. ROE. Yes.

Ms. LI. Item: More than 150 acres of prime wetlands in the Hackensack Meadowlands will be replaced by massive development under a permit issued by the Army Corps of Engineers earlier this year.

Item: Wetlands in Absecon Inlet were proposed for destruction as part of a casino development project in Atlantic City approved by the Army Corps.

Both these projects occurred in the State of New Jersey. Both has been approved by the U.S. Army Corps of Engineers as consistent with section 404 of the Clean Water Pollution Control Act amendments. And in both these instances, other Federal agencies had strongly recommended against approval.

These instances are not isolated nor are they confined to just one State. It is estimated that approximately 56 percent of the original wetlands in the Continental United States has been lost due to development. Annually, more than 450,000 acres of wetlands are destroyed.

If any State stands to lose from the destruction of wetlands, it is New Jersey. What would New Jersey be without the wetlands and coastal areas that dot our shore and which provide the recreational activities that constitute the second largest industry in the State? Without the fish and shellfish that spawn in our wetlands? Without the flood control benefits that wetlands provide?

From northern New Jersey all the way to Cape May, wetlands are important to the residents of the State. For some, wetlands protection preserves their livelihood. For others, it represents the last remaining vestige of open space in the country's most densely populated State.

Congressional intent in 1977 may have been to protect as much wetlands as possible. Since that time, it is clear that the language of the existing act contains too many loopholes favoring development. Time and time again, the U.S. Army Corps of Engineers has found justification for nonwater dependent uses in wetlands, even in the face of strong opposition from other Federal review agencies.

The examples cited in the beginning are but only two of numerous instances where congressional intent has been disregarded. An equally destructive project is the Timber Properties development near Great Swamp National Wildlife Refuge. The corps approved a 22-acre townhouse project allowing for the filling of 8 acres of wetlands. The U.S. Fish and Wildlife Service appealed the decision to the Assistant Secretary of the Army where the decision was ultimately reaffirmed.

Although the 1977 amendments provided other Federal review agencies opportunities to object and hold up projects for more extensive review, administrative changes have greatly stymied the process. New working agreements between the corps and the Federal review agencies took away most of the clout they once had and resulted in a proliferation of the types of environmentally unsound projects cited above.

We believe that the proposed changes under H.R. 3282, the Water Quality Renewal Act, will strengthen existing provisions and provide the type of protection so urgently needed. The proposed amendments prohibit the issuance of a dredge and fill permit by the corps unless it is established that the discharge will not

have an unacceptable adverse effect on the aquatic environment and that there are no practicable alternatives which have less adverse effects.

The proposed amendments also bar the District Engineer from issuing a permit within 30 days of notification if other Federal agencies express opposition. It requires the District Engineer to explain in writing the rationale for issuance of a permit. Federal review agencies are allowed to elevate a permit to the Secretary of the Army for an ultimate decision.

We believe that with these changes, better and more sensitive decisionmaking will occur. We believe that the proposed amendments will provide protection to a rapidly disappearing resource, our Nation's wetlands, and we urge that you, Mr. Chairman, and your subcommittee endorse these measures.

Thank you.

Mr. ROE. Well, thank you very much for splendid testimony.

Of course I may be a bit prejudiced coming from the State myself, but I think you have added a great deal to our thought process and deliberations, and I think your testimony has been succinct and says something. It is not just philosophy. It speaks to specific issues. I have no questions at this point.

The gentleman from New Jersey.

The CHAIRMAN. I thank you, Mr. Chairman.

I wish to thank our witnesses and state to my colleagues on the committee that in many ways this testimony has revealed a microcosm of the whole Nation. We have heard about the ocean, the fishing, the recreational areas and how we must keep them pure for the good of the economy, as well as recreation.

We heard testimony from the gentleman from New Jersey, Mr. Roe's area, Passaic, where there is an industrial river to adequately supply the needs of the industry that is there. Meanwhile we must insure that it is kept clean, pure, and potable for the people who live there. We also heard from are representatives of an area which maybe many people don't know about in New Jersey. We had a great amount of rural areas with toxic dumps in and near the great resource known as the Pine Barrens. There are also, of course, the wetlands, as Ms. Li spoke of, and the importance of preserving them. Even if in some cases she may be talking about 8 acres, maybe many of the people from our great large States may feel that is not very much space.

But an acre is a lot of territory in our State, being such a small State as it is in size. We have more people per square mile living in New Jersey than Japan, for instance. Japan has 700 people per square mile and New Jersey has 940 people per square mile. So every bit of open land that we have is well appreciated because of the size and population of our State.

I do think that our witnesses made a statement as to what the responsibility should be of the Federal Government. I want to thank them for their testimony concerning the responsibilities of the States and local communities as well. Those officials should not be able to come to Washington and expect Washington to solve all their problems in toto.

So I wish to thank you for the work you did in a very short time. With 20,000 signatures these petitions state the views of the citizens of New Jersey and the country as well.

I want to thank you, Mr. Chairman, for being here and conducting these very important hearings. For the record, I am sure we will come out of this committee perhaps the first of the year with a bill which we and the Congress and the Nation can be proud.

Thank you.

Mr. ROE. Any further questions of the witnesses? The gentleman from Arkansas?

Mr. HAMMERSCHMIDT. Mr. Chairman, I don't have any questions but I want to join the chairman of the full committee as well as the chairman of the subcommittee in thanking this very fine panel for being here this morning and bringing us such articulate testimony. We are very appreciative.

Thank you, Mr. Chairman.

Mr. ROE. Thank you. We want to thank you for your very excellent testimony and certainly will give every consideration to the points you have raised. We appreciate your being with us this morning.

Our next witness this morning is Mr. Andrew Holtan, who represents the National Environmental Training Association.

Mr. Holtan, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT PREPARED AND SUBMITTED ON BEHALF OF THE NATIONAL ENVIRONMENTAL TRAINING ASSOCIATION

INTRODUCTION

This testimony is to express the support of the membership of the National Environmental Training Association (NETA) regarding the overall reauthorization of the Clean Water Act. NETA strongly supports continued funding at no less than fiscal year 1982 levels for the following provisions: Operator training as authorized by sections 104(g)(1) and 104(u)(2); Grants for Training and Research Fellowships as authorized by sections 104(g)(3) and 104(u)(1); tne Training Grants, Contracts and Scholarships as authorized by sections 109, 110, 111 and 112.

A competent environmental work force is absolutely essential in order to accurately assess what levels of controls are necessary and to determine the best means of attaining our environmental quality goals. Our Federal, state, county, and local regulatory staff must be well trained to deal with these questions. As our recent experiences with hazardous wastes have clearly demonstrated, it is much cheaper to control pollutants than it is to clean up after the fact. We must know enough about the state-of-the-art to be able to design present control programs and to project future environmental impacts.

Training is also the key to maximizing the impact of billions of tax dollars we have spent and will spend on environmental controls. The designers and operators of pollution abatement facilities must be competent. They must be able to construct and operate plants which are cost effective. Only competent operators can save money on operating costs such as reduced energy needs through the proper operation and maintenance of equipment, reduced chemical cost through proper calculation and testing, and finally through reduced enforcement at all governmental levels through increased plant compliance.

NETA is the only national nonprofit organization dedicated exclusively to environmental training. NETA's membership encompasses all but one of the 50 states and represents the principal training contact and training manager for each and every state. The goals and objectives of the Association are to develop and maintain a competent environmental workforce through education and training.

Although NETA is concerned with all sectors of environmental training, this testimony will concentrate on water quality and wastewater treatment. The urgency

for training and the necessity for training applies equally to the other areas of environmental training (air, solid waste, drinking water, toxic and hazardous wastes, noise, etc.).

PROBLEM

Our nation is facing a tremendous challenge for the 1980's. We are searching for ways to cope with unemployment, deal with a troubled economy, care for our elderly and maintain an acceptable environmental quality.

As our elected legislators you must balance the nation's resources to deal with these problems. Our major concern at this hearing is to address the issue of maintaining an acceptable environmental quality. The GAO publication "Environmental Protection Agenda for the 1980's" poses the three general questions:

What levels of control are needed?

How do we balance environmental protection with other equally desirable goals?

How do we maximize the impact of the billions of dollars spent on environmental controls?

For almost a decade now we have invested billions of public tax dollars in wastewater treatment facilities. The EPA 1982 Needs Survey estimates that the backlog of current needs for wastewater treatment and interceptor sewers will cost an additional $35.4 billion. The projected total for existing growth facilities to the year 2000 will total $57.3 billion.

Clearly we have invested tremendous financial resources in water quality facilities. By contrast our investment in training to develop a competent environmental workforce to operate and maintain these facilities has been negligible.

Training is a significant factor in balancing environmental protection with equally desirable goals in that more can be done with less through improved productivity and cost effectiveness. Training is also a major contributor to maximizing the impact of the dollars spent on environmental controls. Competent staff improve compliance and reduce enforcement costs, reduce chemical and electrical operation costs and prolong the life of equipment through proper O & M.

The transition from primary wastewater treatment to secondary treatment represented a quantum leap in technology for which the workforce was ill prepared. Despite the tremendous investment of public tax revenues in the construction of highly technical wastewater treatment facilities, a 1981 GAO study reported that over 87% of the privately owned treatment plants operate improperly and that 31% are in serious violation of NPDES permit limitations. In many cases, permit limits were exceeded by 100 percent (1000 percent in some cases) often for periods exceeding one year.

A report in 1980 by Hegg et al indentified the top three factors responsible for poor plant perfomance as:

1. Failure to apply treatment concepts;
2. Failure to understand treatment concepts;
3. Improper advice and guidance from advisors.

The International Joint Commission on the Assessment of Human Health Effects of Great Lakes Water Quality reported that "optional functioning" of wastewater treatment plants will require improved plant operator training.

The need for training is further substantiated when the demand and supply of qualified and competent environmental work force is examined. At present construction rates, an estimated 3000 additional environmental works will be needed each year as projected by the draft copy of the 1990's Construction Grants Strategy Report. A 1980 Report by the American Academy of Environmental Engineers demonstrated how critical the problem of an inadquate work force is. The Academy's report showed a reduction in the number of graduates with an environmental degree and a reduction in the number of advanced degree candidates.

The ramifications are far reaching, not only is there s very limited supply of advanced degree graduates to continue the development of an environmental work force, but the limited supply of existing workers results in aggressive competition for the most competent. Because salary ranges are greater in the private sector and the Federal government, the states, counties, and local governments must settle for individuals less prepared to effectively deal with environmental challenges. As the 1980 GAO study of 140 water systems revealed there are a lack of funds and a lack of qualified personnel at state and local levels.

The result is that state and local governments are the training ground for the Federal government and private sector and have an even greater need for training to develop a competent environmental work force. Few will be able to take a responsible position as they attempt to deal with inflation and significant reductions in all

areas of Federal financial assistance. The nesessity for training is intensified when staff and budget are extremely limited. Under these conditions employers such as local governments cannot afford to take the time and money to correct mistakes or to increase enforcement activities.

The supply of competent operating staff for treatment facilities is equally overtaxed. As previously noted, the two top factors responsible for poor plant performance are failure to understand and apply treatment concepts. Cleearly there is a significant demand for developing the competency and skills necessary to properly operate and maintain these sophisticated, highly technical treatment facilities effectively.

In these times of sevère economic constraints the emphasis on training is good business and represents the positive side of enforcement. Enforcement without assistance is counterproductive. The offer of training in concert with enforcement promotes cooperation and compliance.

UPDATE ON TRAINING

Tremendous advances have been made in the field of environmental training and technical asssitance. The U.S. EPA established extensive support services for technical assistance and training to include technical guidance, direct training and financial support for establishing local environmental training programs. The U.S. EPA National Training and Operational Technology Center (NTOTC) was established to disseminate this information, make training resources available, and coordinate training resources to minimize duplication of effort and maximize limited training funds. This responsible position has however deteriorated. Since 1973, 72 percent of the expenditures for O and M training have been rescinded and the staff in this area reduced to less than one in eanh of 10 regional sections and a handful at the Washington Office. The NROTC has been completely eliminated.

With the guidance and assistance of U.S. EPA, State governments, academic institutions and associations established training programs for the environmental work force. Few programs were, however, established as self-sufficient programs. Many depended wholly or, in part, on training resources such as manuals and financial assistance from the U.S. EPA.

In 1981 the U.S. Congress refused to accept the position that EPA's role in environmental training was finished. The Congressional add on funds for fiscal year 1982 are now in place and onsite technical assistance is being provided to teatment facilities which are not in compliance with operating standards. Although it is too early to assess the effectiveness of this effort one thing is clear. The State regulatory agencies are cooperating with the 109b Training Centers (Training facilities constructed with funds from section 109b PL92500) who offer assistance in obtaining compliance and bring their own finances. The ties and relationships established in this effort will in many cases carry on beyond the term of this project.

There are however serious problems with the process of making grant awards. There were no provisions for evaluating the effectiveness of the training funds. Because of the disruption in the national training network, the funds were in some cases awardedd to organizations who had no record of environmental trainging. Finally, there was still no commitment to formulating a National Plan to provide for the development of a competent environmental workforce.

In 1982 Congress again refuted EPA's position that the national responsibility for development of a competent environmental workforce is complete. The experience of allocating the fiscal year 1982 funds resulted in significant improvements in the allocation of fiscal year 1983 funds. Funds were directed to conducting an evaluation of the fiscal year 1982 Activities and to undertake the initial activities necessary to pave the way for the development of a National Plan to develop a competent environmental workforce. Also, for the first time environmental training funds will be awarded to all states. State regulatory agencies will become aware once again of the need for and benefits of training a competent environmental workforce and ties with the 109b Training Centers have been reviewed. The drawbacks of this year's approach are the constant change in how and to whom the funds should be allocated are confusing both the states and the 109b training centers. Neither knows what to expect or to plan for in the coming year. In short, we still need a National Plan. It is imperative that funds for fiscal year 1983 be appropriated to strengthen the regulatory—training ties and to continue the process of developing a National Plan.

SUCCESSES

Everyone professes to acknowledge training as a necessary and critical entity. Private industry has long recognized that training is a cost effective activity. How cost effective? The U.S. EPA Office of State and Local Manpower Development Branch published a report in 1973 which stated that every dollar invested in training results in a savings of $91.

The training and development of a competent operating staff can reduce operating expenses in the following ways:

Proper operation and maintenance of equipment reduces costly repairs and replacement as well as reducing energy (electrical) costs.

Skills in computation, testing, and analysis reduce overdosage of costly chemicals.

Proper operation and maintenance improve compliance thereby reducing costly enforcement action at all levels of government as well as reducing the need for reaction to enforcement orders.

The end result is a more cost effective pollution abatement effort.

Training can often represent the difference between compliance and non-compliance. The January 1981 edition of the journal "Water/Engineering and Management" reported on a wastewater treatment facility in Durham, N.C. which consistently exceeded the NPDES permit limitations. After attending an EPA workshop on "Activated Sludge Process Control" sponsored and instructed by the NTOTC, the facility's compliance with effluent requirements improved from 61 percent to 90 percent of the time. Consider the cost savings resulting from a reduction in enforcement, compliance monitoring, and efforts expended to react to enforcement actions.

SUPPORT

The need for training is recognized and supported by all sectors of the country. The Water Pollution Control Federation (WPCF) in 1979 published the article "Operation and Maintenance of Water Pollution Control Facilities: A White Paper" which included forty references to the need for and recommendations for training. The National Office of NETA has received numerous copies of letters stating concern and support for training ranging from the Personnel Advancement Committee of the N.W. WPCF to the "grass roots" membership of NETA.

Other national organizations such as the American Clean Water Association, the National Demonstration Water Project, the Association of Metropolitan Sewerage Agencies, the American Academy of Environmental Engineers, the National Academy of Sciences has expressed support for training and development of an environmental work force.

Despite the critical role played by well trained operators for the past several years, EPA has not requested the Congress to appropriate training funds. Fortunately, Congress has wisely refuted EPA's decision for the past two years and allocated $2.6 million for water quality training purposes.

Congress is urged to continue to take the lead in establishing environmental training as a national priority and in demonstrating a commitment to environmental training by reauthorizing the sections of the Clean Water Act which provide for training.

As stated previously, the NETA is equally concerned with financial and technical assistance to the other areas of the environmental training. Congress is strongly encouraged to review the specific issues in this testimony and apply the concepts to the environmental training for drinking water, solid waste, toxic materials, and hazardous wastes, air quality, noise, etc.

The NETA is thankful for the opportunity to provide this testimony and respectfully request that Congress consider our concerns and assume a responsible position in developing a competent and qualified environmental work force.

Mr. ROE. Please proceed.

TESTIMONY OF ANDREW A. HOLTAN, CHAIRMAN, GOVERNMENTAL AFFAIRS COMMITTEE, NATIONAL ENVIRONMENTAL TRAINING ASSOCIATION

Mr. HOLTAN. Good morning, Mr. Chairman. I certainly thank you. With any luck at all I will be responsible for getting you out to lunch earlier than 12 o'clock. I will keep my comments brief and paraphrase a lot of the statements submitted to you.

Mr. Chairman and members of the committee, I would like to thank you for this opportunity to provide testimony this morning. My name is Andrew A. Holtan. I am the training manager with the State of Maryland Health Department. However, I am testifying today on behalf of the National Environmental Training Association.

NETA is a national not-for-profit organization supported by membership dues. This testimony is to express the support of the membership of NETA regarding the overall reauthorization of the Clean Water Act. NETA strongly supports the continued funding at no less than fiscal year 1982 levels for the following provisions.

Operator training as authorized by sections 104(g)(1) and 104(u)(2), grants for training and research fellowships as authorized by sections 104(g)(3) and 104(u)(1); and training grants, contracts, and scholarships as authorized by sections 109, 110, 111, and 112.

A competent environmental work force is absolutely essential in order to accurately assess what levels of controls are necessary and to determine the best means of attaining our environmental quality goals. Our Federal, State, country, and local regulatory staff must be well trained to deal with these questions. As our recent experiences with hazardous wastes have clearly demonstrated, it is much cheaper to control pollutants than it is to clean up after the fact. We must know enough about the state-of-the-art to be able to design present control programs and to project future environmental impacts.

Training is also the key to maximizing the impact of billions of tax dollars we have spent and will spend on environmental controls. The designers and operators of pollution abatement facilities must be competent. They must be able to construct and operate plants which are cost effective. Only competent operators can save money on operating costs such as reduced energy needs through the proper operation and maintenance of equipment, reduced chemical cost through proper calculation and testing, and finally through reduced enforcement at all governmental levels through increased plant compliance.

NETA is the only national nonprofit organization dedicated exclusively to environmental training. NETA's membership encompasses all but 1 of the 50 States and represents the principal training contact and training manager for each and every State. The goals and objectives of the association are to develop and maintain a competent environmental work force through education and training.

Although NETA is concerned with all sectors of environmental training, this testimony will concentrate on water quality and

wastewater treatment. The urgency for training and the necessity for training applies equally to the other areas of environmental training—air, solid waste, drinking water, toxic and hazardous wastes, noise, et cetera).

Problem. Our Nation is facing a tremendous challenge for the 1980's. We are searching for ways to cope with unemployment, deal with a troubled economy, care for our elderly and maintain an acceptable environmental quality.

As our elected legislators, you must balance the Nation's resources to deal with these problems. Our major concern at this hearing is to address the issue of maintaining an acceptable environmental quality. The GAO publication Environmental Protection Agenda for the 1980's poses the three general questions:

What levels of control are needed?

How do we balance environmental protection with other equally desirable goals?

How do we maximize the impact of the billions of dollars spent on environmental controls?

For almost a decade now we have invested billions of public tax dollars in wastewater treatment facilities. The EPA 1982 needs survey estimates that the backlog of current needs for wastewater treatment and interceptor sewers will cost an additional $35.4 billion. The projected total for existing growth facilities to the year 2000 will total $57.3 billion.

Clearly we have invested tremendous financial resources in water quality facilities. By contrast our investment in training to develop a competent environmental work force to operate and maintain these facilities has been negligible.

Training is a significant factor in balancing environmental protection with equally desirable goals in that more can be done with less through improved productivity and cost-effectiveness. Training is also a major contributor to maximizing the impact of the dollars spent on environmental controls. Competent staff improve compliance and reduce enforcement costs, reduce chemical and electrical operation costs and prolong the life of equipment through proper O&M.

The transition from primary wastewater treatment to secondary treatment represented a quantum leap in technology for which the work force was ill prepared. Despite the tremendous investment of public tax revenues in the construction of highly technical wastewater treatment facilities, a 1981 GAO study reported that over 87 percent of the privately owned treatment plants operate improperly and that 31 percent are in serious violation of NPDES permit limitations. In many cases, permit limits were exceeded by 100 percent—1,000 percent in some cases—often for periods exceeding 1 year.

A report in 1980 by "Hegg et al." identified the top three factors responsible for poor plant performance as:

One, failure to apply treatment concepts;

Two, failure to understand treatment concepts;

Three, improper advice and guidance from advisers.

Because salary ranges are greater in the private sector and the Federal Government, the States, counties, and local governments must settle for individuals less prepared to effectively deal with en-

vironmental challenges. As the 1980 GAO study of 140 water systems revealed there are a lack of funds and a lack of qualified personnel at State and local levels.

The result is that State and local governments are the training ground for the Federal Government and private sector and have an even greater need for training to develop a competent environmental work force. Few will be able to take a responsible position as they attempt to deal with inflation and significant reductions in all areas of Federal financial assistance. The necessity for training is intensified when staff and budget are extremely limited. Under these conditions employers such as local governments cannot afford to take the time and money to correct mistakes or to increase enforcement activities.

The supply of competent operating staff for treatment facilities is equally overtaxed. As previously noted, the two top factors responsible for poor plant performance are failure to understand and apply treatment concepts. Clearly there is a significant demand for developing the competency and skills necessary to properly operate and maintain these sophisticated, highly technical treatment facilities effectively.

In these times of severe economic constraints the emphasis on training is good business and represents the positive side of enforcement. Enforcement without assistance is counterproductive. The offer of training in concert with enforcement promotes cooperation and compliance. While everyone professes to acknowledge training as a necessary and critical entity, few would deny the fact that training is necessary. But how necessary? How cost effective is it?

The USEPA Office of State and Local Manpower Development Branch published a report in 1973 which stated that every dollar invested in training results in a savings of $91.

The training and development of a competent operating staff can reduce operating expenses in the following ways:

Proper operation and maintenance of equipment reduces costly repairs and replacement as well as reducing energy—electrical—costs.

Skills in computation, testing, and analysis reduce overdosage of costly chemicals.

Proper operation and maintenance improve compliance thereby reducing costly enforcement action at all levels of government as well as reducing the need for reaction to enforcement orders.

Congress is urged to continue to take the lead in establishing environmental training as a national priority and in demonstrating a commitment to environmental training by reauthorizing the sections of the Clean Water Act which provide for training.

The NETA is thankful for the opportunity to provide this testimony, and respectfully request that Congress consider our concerns and assume a responsible position in developing a competent and qualified environmental work force.

Mr. ROE. Thank you for your testimony. Could you give us a little bit more of a rundown on the National Environmental Training Association? Does it represent most of the States?

Mr. HOLTAN. We have members in 49 States. They are individuals that are employed, such as myself, by government at all

levels, Federal, State, and county, who have a training responsibility, a training role. Membership also includes academic institutions that provide training as well as the private sector which is involved in providing training for a fee for a service.

Also, we have a large number of our membership that are full-time operators, but recognize that they have a part-time training responsibility to train their staff. We number about 600. Those 600 individuals are by and large the key figures in each and every State that are involved with training.

Mr. ROE. Has your organization put together any summary that could give us some more details as far as what you are doing? In other words, I am interested in how effective are we? What do we need? What do you see down the road? I happen to think that your testimony is extremely important because as you indicate, the implementation depends upon people implementing the program.

Mr. HOLTAN. Absolutely.

Mr. ROE. Having said that it would be helpful to us if you could summarize in added testimony how effective is it, what more should we be doing? Are we doing enough in that area?

Mr. HOLTAN. We are in the midst right now of doing a national survey of every State to determine the state of the art of training.

Mr. ROE. When will that be available do you think?

Mr. HOLTAN. We will be tabulating the results the end of October, presenting them to EPA in November. And then meeting with individuals primarily from the appropriate Senate subcommittee to look at these findings, and from that, to prepare a final report and draft a national plan.

The reason for this testimony is to keep those avenues for channeling training funds open and viable. We can provide I would think by January you with that.

Mr. ROE. Would you plan on that?

Mr. HOLTAN. Yes, sir.

Mr. ROE. What the committee would like to have is a follow-up from you as to what your analyses and review indicates as far as implementation is concerned. That could be extremely helpful. Where do we have shortages, what should we be doing in that direction. I think it would be very helpful to the committee, so we will be calling you back to make that presentation.

Mr. HOLTAN. Fine.

Mr. ROE. Any further questions? The gentleman from Nebraska.

Mr. DAUB. I thank the chairman and just want to say more than a question to you, Mr. Holtan, to make a statement of support for your position and the points of view that are made in the testimony, which I read. I believe if you go back and check the record of this committee, you will find--you may have already done so—almost an unblemished record in terms of this committee's support for the Clean Water Act's training and educational provisions.

In virtually every annual report to the Budget Committee that I have examined, this committee has repeatedly pointed out the shortcomings of budget proposals which have sought to inadequately fund programs you testified in support of today. So I want you to know that I have every reason to believe that this kind of support will continue, and I hope together we can give these matters very high priority because they deserve it.

Mr. HOLTAN. Thank you. The committee is to be applauded for their position.

Mr. ROE. Any further questions? We want to thank the gentleman very much for his testimony. We look to hear from you further toward the end of the year. Thank you very much.

Mr. HOLTAN. Thank you.

Mr. ROE. The committee will stand recessed until tomorrow at 9:30. We will meet in room 2253.

Thank you very much, ladies and gentlemen.

[Whereupon, at 11:45 a.m., the subcommittee was recessed, to reconvene at 9:30 a.m., Thursday, October 20, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, OCTOBER 20, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2253, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen. The hearings will continue on our clean water bill.

We have with us this morning as our first witness, representing the National Association of Manufacturers, Mr. Harold Jensen, who is the director of Energy Conservation and Environmental Control of the Warner Lambert Co. in Morris Plains, N.J. He is a very distinguished representative.

I am happy to have you with us this morning, Harold. If you would identify for the record your colleagues, then we can continue on with your testimony.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY
ON BEHALF OF
NATIONAL ASSOCIATION OF MANUFACTURERS
PRESENTED BY HAROLD JENSEN, DIRECTOR
ENERGY CONSERVATION AND ENVIRONMENTAL CONTROL
WARNER-LAMBERT COMPANY
BEFORE THE
SUBCOMMITTEE ON WATER RESOURCES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES
OCTOBER 20, 1983

Introduction

I am Harold L. Jensen, Director of Energy Conservation and Environmental Control for Warner-Lambert Company, Morris Plains, New Jersey. I am accompanied by Louis C. Gilde, Director of Environmental Programs, Campbell Soup Company, and Daniel W. Cannon, Director of Environmental Affairs, National Association of Manufacturers.

This testimony on Clean Water Act Reauthorization is presented on behalf of the National Association of Manufacturers (NAM), a voluntary association of more than 13,000 enterprises engaged in manufacturing in the United States. Some 80 per cent of these enterprises are in the category of "small business." NAM is affiliated with an additional 158,000 companies through its Associations Council and the National Industrial Council. Many thousands

of these enterprises are direct and indirect dischargers of wastewater into the navigable waters of the United States, and consequently are substantially impacted by the provisions of the Clean Water Act. They greatly appreciate this opportunity to present their views on reauthorization of the Clean Water Act to this distinguished Subcommittee on Water Resources of the U.S. House of Representatives.

Water and Industry

Water is indispensable in the manufacture of the goods which provide us with our high standard of living. Industry uses more than 15 trillion gallons of water per year. However, this is not consumptive use. Some 93 per cent of the water used is returned to receiving streams, some of it with better quality than when it was withdrawn. About two-thirds of the water is used for cooling purposes only and does not come into contact with polluting substances involved in the manufacturing process. Over recent years, industry has increased its production without a corresponding increase in water withdrawals by adoption of re-use and recycling techniques. Manufacturing is the highest economic use of water because of the great value added to raw materials through manufacturing. By contrast, water use for irrigation in agriculture lends a lesser degree of value, is highly polluting, and consumes about 80 per cent of the water used.

Water is not a free commodity. The price of the right

20-955 O—84——72

to use water is incorporated in the purchase price of the land to which the right is attached. There are pumping and labor costs and frequently there are treatment costs to upgrade the raw water to the quality needed for a particular manufacturing process. Costs of water use and water pollution control are incorporated in the price of the product or else the producer will not remain in business very long. Since water is such a pervasive element of the whole productive system, unwarranted costs imposed on the use of water impact adversely on every member of society. The manufacturer acts as a trustee for the consumer when he resists proposals that would impose excessive costs on water use without commensurate environmental benefits. It is the responsibility of the Congress to exercise the utmost wisdom in tailoring the nation's laws so as to achieve national objectives in ways that avoid excessive costs.

We believe that the Clean Water Act provides a good framework for a sound national water pollution control program that meets such criteria. However, no law is perfect. We believe there are some imperfections in the Clean Water Act which could be corrected by the Congress in the process of reauthorization and we respectfully urge the Subcommittee's consideration of the changes discussed below.

Pretreatment

Section 307(b) of the Act requires the EPA Administrator to promulgate "pretreatment standards for

works. When proposing or promulgating introduction of pollutants into treatment works... which are publicly owned for those pollutants which are determined not to be susceptible to treatment by such treatment works or which would interfere with the operation of such treatment any pretreatment standard under this section, the Administrator shall designate the category or categories of sources to which such standard shall apply."

The result of these rigid, inflexible statutory provisions is the imposition of uniform national standards on a myriad of infinitely varying local situations. EPA has indicated that there may be as many as 60,000 connections to publicly owned treatment works. Yet, the law does not allow one iota of variation in its application, even where the standard required may be completely unnecessary for protection of the treatment plant, the sludge, or the receiving water.

The result of this rigid law has been a great deal of confusion and uncertainty in its application. In an effort to bring some reality into this unrealistic law, the Fundamentally Different Factors Variable has been used. The Summer 1983 issue of The Weston Way, published by Roy R. Weston, Inc., describes the Fundamentally Different Factors Variance as "a plant-by-plant adjustment to the limits proposed in the Pretreatment Categorical Standards. Variances will be allowed only if the industry can show that aspects of its operation are fundamentally different than

those considered by the EPA when they developed these limits. Items relating to the nature and volume of the raw wasteload, energy requirements, process modifications, and compliance costs are acceptable items to consider. Factors such as allotted time for compliance, assertion without documentation that a given technology cannot achieve the standards, the ability to pay, and arguments concerning the impact of a discharge on the water quality of a POTW are not acceptable ..." Unfortunately, the U.S. Court of Appeals for the Third Circuit held on September 20, 1983 in National Association of Metal Finishes v. EPA that EPA does not have legal authority to grant Fundamentally Different Factors Variances. Consequently, we are left with rigidity and reality. We urgently plead with the Committee to introduce some flexibility into the pretreatment requirements of the Clean Water Act.

Congress anticipated that each industrial user of public sewers, if regulated at all, would fall into one category and have one compliance deadline. However, EPA has since issued several categorical standards that are much more process-specific than industry-specific. It is now apparent that a complex industrial plant using a variety of manufacturing processes is very likely to be regulated under 2 or more categories. Such a plant is called an integrated facility. Integrated facilities are forced by the current law either to undertake a series of compliance schedule, which is already marginally adequate. Many integrated

facilities are also denied the option of combining and co-treating similar wastewaters from different categories, since they cannot afford to wait for promulgation of the last applicable pre- treatment standard.

Many of our members' manufacturing plants are integrated facilities that fully intend to comply with Clean Water standards. At the same time, we believe that no integrated facility should be forced to make a major investment in treatment until all of the pretreatment standards applicable to that facility have been promulgated in final form.

° Integrated facilities are fundamentally different from facilities with only one type of wastewater.

° The current law imposes an unreasonable burden on integrated facilities. That burden may be unintentional.

° In order to afford integrated facilities equitable treatment under law, the pretreatment provisions of the Act should be amended to:

- Include "integrated facilities" in the list of regulated categories (Section 307(b)(3)).
- Make the compliance deadline for an integrated facility 3 years after promulgation of the last categorical standard applicable to that facility. (Section 307(b)(3).)

An industrial discharger must comply with a specific categorical pretreatment standard within 3 years of its promulgation date. The current law accommodates plants where

only one category applies, but it creates problems for plants where two or more categories apply. It is generally more cost-effective to treat combined waste streams in a single treatment unit rather than to segregate these streams and treat each separately. The current approach discourages combined treatment in multi-category plants because the compliance clock begins running when the first categorical standard is promulgated. Since the categorical standards are being issued sequentially, a discharger must begin to plan, design, and construct treatment facilities before knowing the final requirements of the second categorical standard, the third, and so on. The subsequent standards may change the overall requirements that the discharger will have to meet and cause substantial monies to be misspent in pursuit of a moving target.

A related problem is that the sources of wastewater in different categories are not readily segregated from each other in a typical manufacturing plant. Most older plants were designed and modified without knowledge of future regulatory schemes. Wastewater is generated at dozens of unrelated points, often in combination with other wastewaters of a different nature. The current approach of using a combined waste stream formula ignores the fact that individual streams are often unmeasurable and that many streams are already combined as the result of plant configuration.

The solution to this problem is to start the deadline

clock running when the last pretreatment guideline applicable to the facility is issued. This can be accomplished in one of two ways:

° Congress could authorize a category of pretreatment standards called "integrated facilities" for BAT level of pretreatment requirements. This would allow EPA to issue an integrated category pretreatment guideline (which will include two or more combined pretreatment guidelines).

° Make compliance deadlines 3 years after the last applicable guideline to the integrated facility is promulgated.

Either of these two approaches would start the compliance schedules running at the same time and allow companies to plan compliance in the most cost-effective method possible.

Innovative Technology

We would like to note that Section 301(k) of the Act provides incentives for direct dischargers by allowing compliance date extensions for those using innovative technology. We believe that Congress should provide the same incentives for indirect dischargers to publicly owned treatment works by amending Section 301(k) or Section 307.

Water Quality Standards

We do not believe that designated uses should be frozen as of any particular date. This would assume that all classifications are proper now; this is not a correct

assumption. EPA's proposed revisions to existing water quality regulations appear to provide greater flexibility for maintaining water quality conditions consistent with practical limitations and economic development. Water quality decisions are best made by the states with full public participation in the decision-making process. Under present regulations, some streams are governed by water quality standards that are impossible of attainment. A greater role for the states would provide needed flexibility and recognition of local and regional realities. We are in favor of improving and maintaining stream quality conditions to the greatest extent consistent with economic and physical limitations. Thus, we believe that, once a use has been attained, it should be changed only under highly unusual circumstances, but the door should be kept open for changes when imperatively needed. It should be kept in mind that new manufacturing facilities will be using state of the art pollution abatement technology, and the stream quality will probably not be significantly diminished by siting of modern facilities in instances where industrial use would be made possible.

If industry's options for installing new facilities are unduly limited by stringent water quality policies, there will be a tendency to prolong the life of older facilities. These older facilities, even if retrofitted, will probably discharge more pollutants into the total environment than new facilities in which the most modern pollution abatement

procedures are designed. The Congress and EPA should be continually aware that overregulation in one environmental area can lead to an overall decrease in environmental quality by increasing or prolonging pollution elsewhere.

Bubble Concept

In order to make clear that the use of the bubble concept is authorized under the Clean Water Act, Section 301(e) should be amended to provide that effluent limitations are to be applied to each point source or group of point sources of discharge, provided that water quality is protected.

Best Available Technology Economically Achievable (BAT)

BAT limitations should be required only where there is a significant toxics problem. "Significant toxics problems" should be defined as those where BPT standards or limitations are not providing sufficient protection to the receiving waters and where further abatement would have a measurable effect on receiving waters. Situations where a pollutant is present in the effluent solely as a result of its presence in intake waters should not be considered a significant toxics problem. The legislation should provide flexibility so that States and localities can administer reasonable programs.

BPT standards should not be elevated so as to equal BAT or require zero discharge.

BAT requirements for nonconventional pollutants should not be applied unless water quality demands it.

Non-Point Sources

Uncontrolled non-point source pollution continues to present a major, nationwide water quality problem. This message is emphasized in the 1976 report of the National Commission on Water Quality, and more recently in 1981 report of the House Investigations and Oversight Subcommittee of the House Committee on Public Works and Transportation. Very recently, it has been confirmed by six of the ten EPA Regional Offices. The 1981 report notes the attainment of the Act's goals "is highly dependent on the degree to which non-point source pollution can be controlled."

Section 208 of the 1978 act provided federal grants to state and local units of government to develop programs to control, among other things, non-point source pollution. To date, most states have developed programs for implementation of these programs at the state and local level. However, implementation of these programs has local government fiscal constraints.

NAM Recommendations

NAM's members remain committed to making non-point source control programs work at the state level. Consistent with overall budgetary constraints, NAM supports continued provision of federal funding mechanisms to implement state

and local source programs.

NAM believes that any program to deal with the non-point source problem should be consistent with the following principles:

1. New efforts to deal with non-point source pollution should concentrate first on identified problems with attainable solutions;

2. Primary responsibility for developing and implementing non-point source controls should continue to reside at the state and local levels;

3. States should be afforded broad flexibility in developing the types of non-point source programs that address the particular problems in each state;

4. The federal role in non-point source pollution control is best carried out by providing technical and financial assistance to the states;

5. Positive initiatives, rather than financial sanctions against non-point sources, will have the greatest impact on improving water quality; and

6. Completed and approved Section 208 plans should serve as the starting point for additional efforts to control non-point sources pollution.

Conclusion

The Congress has an opportunity in the course of reauthorizing the Clean Water Act to make a number of changes that would facilitate the achievement of better water quality in the country. The changes we have suggested would simplify and streamline the law, giving it greater flexibility and creating a true Federal-State partnership. We support the extension of the Act for two fiscal years after which Congress would review the program. We question the wisdom of reauthorizing the Act for four or five fiscal years.

Mr. ROE. Please proceed.

TESTIMONY OF HAROLD JENSEN, DIRECTOR OF ENERGY CONSERVATION AND ENVIRONMENTAL CONTROL, WARNER-LAMBERT CO., AND CHAIRMAN OF THE NATIONAL ASSOCIATION OF MANUFACTURERS' WATER TASK FORCE, ACCOMPANIED BY LOUIS GILDE, DIRECTOR OF ENVIRONMENTAL PROGRAMS, CAMPBELL SOUP CO., AND DANIEL W. CANNON, DIRECTOR OF ENVIRONMENTAL AFFAIRS, NATIONAL ASSOCIATION OF MANUFACTURERS

Mr. JENSEN. Very good. Thank you.

On my right is Mr. Louis Gilde, director of environmental programs at the Campbell Soup Co., also of New Jersey.

Mr. ROE. Very fine soup, by the way.

Mr. JENSEN. And Daniel W. Cannon is on my left, director of Environmental Affairs of the National Association of Manufacturers.

Mr. ROE. OK. You go ahead with your testimony. We have it in full. I think it is not that long and I think it is pretty important because you represent the industry. So I think you ought to go with the whole testimony.

Mr. JENSEN. Thank you very much.

This testimony on Clean Water Act reauthorization is presented on behalf of the National Association of Manufacturers [NAM], a voluntary association of more than 13,000 enterprises engaged in manufacturing in the United States.

Some 80 percent of these enterprises are in the category of small business. NAM is affiliated with an additional 158,000 companies through its associations council and the National Industrial Council.

Many thousands of these enterprises are direct and indirect dischargers of wastewater into the navigable waters of the United States, and consequently are substantially impacted by the provisions of the Clean Water Act. They greatly appreciate this opportunity to present their views on reauthorization of the Clean Water Act to this distinguished Subcommittee on Water Resources of the U.S. House of Representatives.

When I testified on August 2 before your hearing, I presented to you the NAM position statement so that it is in the record now.

Water is indispensable in the manufacture of the goods which provide us with our high standard of living. Industry uses more than 15 trillion gallons of water per year. However, this is not consumptive use. Some 93 percent of the water used is returned to receiving streams, some of it with better quality than when it was withdrawn. About two-thirds of the water is used for cooling purposes only and does not come into contact with polluting substances involved in the manufacturing process.

Over recent years, industry has increased its production without a corresponding increase in water withdrawals by adoption of reuse and recycling techniques. Manufacturing is the highest economic use of water because of the great value added to raw materials through manufacturing. By contrast, water use for irrigation in agriculture lends a lesser degree of value, is highly polluting, and consumes about 80 percent of the water used.

Water is not a free commodity. The price of the right to use water is incorporated in the purchase price of the land to which the right is attached. There are pumping and labor costs and frequently there are treatment costs to upgrade the raw water to the quality needed for a particular manufacturing process.

Costs of water use and water pollution control are incorporated in the price of the product or else the producer will not remain in business very long. Since water is such a pervasive element of the whole productive system, unwarranted costs imposed on the use of water impact adversely on every member of society.

The manufacturer acts as a trustee for the consumer when he resists proposals that would impose excessive costs on water use without commensurate environmental benefits. It is the responsibility of the Congress to exercise the utmost wisdom in tailoring the Nation's laws so as to achieve national objectives in ways that avoid excessive costs.

We believe that the Clean Water Act provides a good framework for a sound national water pollution control program that meets such criteria. However, no law is perfect. We believe there are some imperfections in the Clean Water Act which could be corrected by the Congress in the process of reauthorization and we respectfully urge the subcommittee's consideration of the changes discussed below.

I will depart from my text for a little bit just to summarize our positions on the area of pretreatment.

The EPA has chosen to write the pretreatment requirement regulations more on a business-by-business or process-by-process mode rather than industrywide. This has resulted in a number of regulations coming out over a phased time period and these various regulations apply to manufacturing plants in different ways.

The result is that more than one regulation may apply to any one particular manufacturing plant. We call these integrated facilities or a facility that is under more than one regulation.

As a result, there will be a series of regulations coming into effect over a phased time period and the facility is faced with the responsibility of installing pretreatment facilities to meet phased regulations. This is quite cumbersome for the industry and they are placed in a position of constructing several different treatment processes. We are guessing what the final regulations will be to meet.

The point I am getting at is we are looking at a pretreatment requirement that has a completion date keyed in the final regulation implementation.

We also see a considerable problem in the restrictive nature of pretreatment requirements. There are some 60,000 dischargers into municipal collection systems and there is very little, essentially no room for movement to meet all these different conditions of the municipalities and the industries.

The recent judicial ruling that ruled out the fundamentally different factors criteria that EPA has put forward places industry in a very cumbersome posture in that they will in many cases not be able to meet these pretreatment requirements. Therefore, our main theme here is flexibility in the pretreatment requirements and this flexibility be placed on the local level.

We feel that the solution to these problems——

Mr. ROE. Let me interject there. When you are speaking of flexibility, I think you have to illustrate a little bit further.

Basically what you are saying is that, one, because EPA did not issue a composite of regulations and there were regulations that were issued over a period of time, that they could even be in conflict. Is that a reasonable statement?

Let's assume I was calling upon you to do pretreatment, and I think what you are saying is, we are not quarreling with the idea of pretreatment per se. What we are coming back and saying is that we might have many different elements and processes involved, and we have different sets of regulations relating to those individual processes which therefore could mess us all up because we can't really put the whole thing together unless you give us some final end that you are trying to meet and some process with which you are trying to do it. Is that a reasonable statement?

Mr. JENSEN. We are talking about two different factors here. One is the time scheduling of these regulations.

Say a facility has two or three different industry types within the same plant and one regulation is going to come out this year and another one next year and another one 2 years from now. So we are looking at a time period in which we can meet that.

Mr. ROE. So let's divide that, because I know that the fundamental issue that people in pretreatment are concerned with is the process of EPA and the time frame in putting out their regulations. We have multiple processes going on in one plant and you have been able to have the time frame to get a composite together, and to get that done in the time specified originally under the amendments in 1970 and 1971. Is that a correct statement to make?

Mr. JENSEN. Correct.

Mr. ROE. So therefore, we are really saying we have to achieve two goals. One is a solid direction in which we want to go on pretreatment versus the time to implement it. So that if I am going to be doing pretreatment in my plant, I am going to do water conservation and so forth, I have to have the whole picture to make the corporate decisions that have to be made in order to do that. Is that a reasonable statement?

Mr. JENSEN. Yes. That is with respect to the scheduling.

We are also talking about the factor of the integrating of our facilities into the municipal treatment and collection system to determine whether the pretreatment is really required or not.

The point there is that the present requirements are so rigid that there is no freedom of movement to say that the pretreatment is really technically not required within the city because it is not going to improve the quality of the sludge, the quality of the receiving water and it is not going to upset the treatment process.

Mr. ROE. You see, I think that is the point you have to make. There are good guys and bad guys and black hats and white hats.

I think what you have to get on the record is the facts that we are dealing with here, and they are coming back and saying, nobody wants to do treatment for treatment's sake. That is a waste of money. That is not going to solve the problem we are trying to solve in the first place.

But the committee is fundamentally concerned with two issues in this particular pretreatment. One, do we remove the pollutants beforehand, which is the purpose of pretreatment? Do we allow them to go through the system and then become cumulative in the sludge? And then we have a problem getting rid of the sludge. Those are the two basic parameters that I see.

You are coming back and saying, No. 1, we are not quarreling about pretreatment. We have to have some kind of a mechanism and a time element involved and a recognition of the composites of different systems within a particular manufacturing process that achieved the goal. And if we have rigidity of regulations and different elements of this process, then it can countervene some of the things we are trying to do to get it corrected. Or, two, it could mean that you don't have enough information to be able to build a composite system to remove these materials.

Do you see what I am trying to get at?

Mr. JENSEN. Yes.

Mr. ROE. So we are not talking about the rigidity of the individual regulation you don't want to leave the impression that you should not do pretreatment. That is not the issue you are trying to make this morning, is it?

Mr. JENSEN. That is right.

Mr. ROE. We are saying what we ought to do is get a process that is going to work and be cost effective and make some sense in a reasonable time period.

Mr. JENSEN. That is right. We are not against pretreatment. We know that we must protect the municipal treatment plant. We know we must protect the sludges that come from that. We know we must protect the receiving water. That is what the act is all about.

However, we don't feel it is appropriate to pretreat for pretreatment's sake when it is really not needed to protect those three areas.

Mr. MOODY. Would it be all right for questions on this point?

Mr. ROE. I think he is right at the heart of this issue on pretreatment, so let's go ahead if you want to ask questions.

Mr. MOODY. Thank you, Mr. Chairman.

What kind of regime would you like to see in pretreatment? I think the chairman is correct. This is a very crucial component of everything we are looking at. You described what was wrong.

Should the pretreatment be on an ad hoc basis depending on the quality of what is downstream from the plant, that is, the capacity of the receiving waters or the capacity of the plant, the use of the sludge? Should all those things be taken into account? Is that one extreme position?

How do you make these decisions on an ad hoc basis where you really have some quality, equity, and uniformity across the Nation? How would you set up a regime to make the decisions that these rigid rules don't make?

Mr. JENSEN. A municipality has an NPDES permit and that permit is a statement of the requirements for the discharge to protect the receiving waters and, therefore, the municipality then can work within the framework of that NPDES permit to meet the permit.

So you don't need to worry about what the receiving waters might take because that is already set up within it.

Mr. MOODY. But who makes the optimum decision as to whether or not, let's say, heavy metals, whether it should be taken out at the plant level or if they should be taken out at the municipal treatment level or should—in some cases someone would argue they should be allowed to be in the sludge since the sludge is destined for some use where it is not harmful.

How do you make that decision?

Mr. JENSEN. I think the municipalities can make that decision with the help of the States. We do have the pretreatment requirements to be imposed if required. This is an issue where the actual concentrations within the receiving waters, the raw waters, untreated waters coming in can be evaluated.

If it is a large municipality and it is only one person discharging heavy metals, you won't even find them in there and it would not do any disruption to the treatment process at all. I think that that could go to the municipal treatment plant.

Mr. MOODY. So you are saying it should be a municipal or system-by-system basis, not at the State level or at the Federal level.

Mr. JENSEN. That is right. The Federal level can give guidelines and your technical data about what a treatment plant basic concept, whether it is sludge or whatever, can or cannot do. But really it is between the State and the local municipality to work out these programs.

Many municipalities have been doing it for 20 years or more.

Mr. MOODY. Thank you, Mr. Chairman.

Mr. JENSEN. With respect to the time phasing, we start the clock running on the regulation for pretreatment when the last pretreatment guideline application to the facility is issued.

This can be accomplished by either of two ways. One, Congress could authorize a category of pretreatment standards called integrated facilities for BAT level of pretreatment requirements. This would allow EPA to issue an integrated category pretreatment guideline which will include two or more combined pretreatment systems or make compliance deadlines, 3 years after the last applicable guideline to the integrated facility is promulgated.

Either of these two approches would start the compliance schedules running at the same time and allow the companies to plan compliance in the most cost effective method possible.

Now a word about innovative technology. We would like to note that section 301(k) of the act provides incentives for direct dischargers by allowing compliance date extensions for those using innovative technology. We believe that Congress should provide the same incentives for indirect dischargers to publicly owned treatment works by amending section 301(k) or section 307.

Mr. ROE. Why?

Mr. JENSEN. I think it is an opportunity to test out innovative technologies. We are talking about 3-year compliance and I know from my experience in air and water systems, when you are committing yourself to meeting something in 3 years and you are trying to look at an innovative technology, you don't have 100 per-

20-955 O—84——73

cent confidence that you will make that within a 3-year time period.

Mr. MOODY. How about incentive issues, the second point you have raised? You are saying the incentives that are now available to publicly owned plants should also be available to privately owned direct discharge plants. Am I reading you correctly?

Mr. JENSEN. No. It is not public/private. It is both industry's direct dischargers and indirect dischargers. There is a distinction.

Mr. MOODY. I see. It is indirect and direct.

Mr. JENSEN. Right.

Mr. MOODY. In other words, right now we allow some legal innovative technological developments for direct?

Mr. JENSEN. Industry direct.

Mr. MOODY. But we do not allow it for indirect. You are saying we should.

Mr. JENSEN. That is correct.

Mr. MOODY. Thank you.

Mr. ROE. You are talking about a uniform policy?

Mr. JENSEN. Yes.

Mr. ROE. Our experience, if I may add an aside, with some of the innovative technology leaves a great deal to be desired, to say the least, in this history of the EPA program.

Go ahead.

Mr. JENSEN. You are talking about municipal?

Mr. ROE. Yes.

Mr. JENSEN. OK.

Now a word about water quality standards. We do not believe that designated uses should be frozen as of any particular date. This is of the receiving waters. This would assume that all classifications are proper now; this is not a correct assumption.

EPA's proposed revisions to existing water quality regulations appear to provide greater flexibility for maintaining water quality conditions consistent with practical limitations and economic development. Water quality decisions are best made by the States with full public participation in the decisionmaking process.

Under present regulations, some streams are governed by water quality standards that are impossible of attainment. A greater role for the State would provide needed flexibility and recognition of local and regional realities.

We are in favor of improving and maintaining stream quality conditions to the greatest extent consistent with economic and physical limitations. Thus, we believe that, once a use has been attained, it should be changed only under highly unusual circumstances, but the door should be kept open for changes when imperatively needed.

It should be kept in mind that new manufacturing facilities will be using state of the art pollution abatement technology, and the stream quality will probably not be significantly diminished by siting of modern facilities in instances where industrial use would be made possible.

If industry's options for installing new facilities are unduly limited by stringent water quality policies, there will be a tendency to prolong the life of older facilities. These older facilities, even if retrofitted, will probably discharge more pollutants into the total en-

vironment than new facilities in which the most modern pollution abatement procedures are designed.

The Congress and EPA should be continually aware that overregulation in one environmental area can lead to an overall decrease in environmental quality by increasing or prolonging pollution elsewhere.

Now, a few words on the bubble concept. In order to make clear that the use of the bubble concept is authorized under the Clean Water Act, section 301(e) should be amended to provide that effluent limitations are to be applied to each point source or group of point sources of discharge, provided that water quality is protected.

Mr. MOODY. Mr. Chairman, I am sorry to be so naive.

Tell me what the bubble concept is.

Mr. JENSEN. As the requirement states, if you have a series of discharge points along one section of a river, each one of those has to meet a particular limit. We would like to see the fact that, let's take, maybe these are controlled by one discharger or a combination of dischargers that have complete control over it. Let's take a look at the fact that maybe we could relax the conditions of one but overcontrol in another area. It would be far more economically advantageous and the net effect upon the river is still the same.

Mr. MOODY. Are you aware that in Wisconsin in the Fox River Valley, the pollution rights are in effect purchasable and salable to permit that kind of flexibility between manufacturers in the paper industry there. We have a system of pollution permits where you pay a fee and that allows that kind of optimization.

Are you familiar with that program?

Mr. JENSEN. I am somewhat familiar with it, yes. There are 10 or 30 mills along the Fox River there and that is one method of controlling the river. We are looking at that on a localized area.

A manufacturing facility might have 10 discharge points along one section of the river and be able to bubble those.

Mr. MOODY. You treat it as one so he can tighten up on one. If it is very effective to do one over here, he could work on this one so that, as a whole, they meet the outflow standards. Is that what you are saying?

Mr. JENSEN. Correct. Absolutely correct.

Mr. MOODY. Thank you, Mr. Chairman.

Mr. JENSEN. A major concern of industry is the effluent guideline deadlines. As you are aware, some of us who must meet the effluent requirement in less than a year and some of these regulations have not even been published and so——

Mr. ROE. Maybe we ought to make that point stronger. We are coming back and saying one of the problems, which is a legitimate problem, is that EPA has not given or produced final regulations, and consequently, in order for industry on the merit of the case to be able to meet those guidelines, you can't obviously meet guidelines if there is not any regulation on it.

Mr. JENSEN. That is correct.

Mr. ROE. That is a very strong and important point.

Now, on the side of industry, we want to do the right thing but industry is saying, we don't know what you want us to do. Is that what you are saying?

Mr. JENSEN. That is right. We can either take the gamble and construct now and miss the guideline or be out of compliance. As the law is now, we are supposed to meet regulations that have not been published and it is impossible to do that.

A further point in that is we feel it is a good idea not to have a final date for compliance just like we have now or else we would be right back in the same condition. We are looking for a 3-year compliance schedule after final promulgation of the regulations and not a final date of 1987, 1988, which some people are advocating.

Mr. ROE. I think they are advocating that because of frustration.

You know we started in 1972. It is now 1983 getting into 1984. That is 10 years. And when do we get the job done?

Mr. JENSEN. The flip side of that would be right in the position we are right now.

Mr. ROE. Why do you say that?

Mr. JENSEN. The EPA still prolongs their regulation schedule.

Mr. ROE. OK.

Can I ask the witness to hold? We are on second call so why don't we go vote and then return. If you will excuse us for about 10 minutes, we will go vote and come right back.

[Recess.]

Mr. ROE. Gentlemen, we will proceed.

You were talking about BAT. You may proceed, Mr. Jensen.

Mr. JENSEN. Thank you.

I just want to make a third and last point on the effluent guideline extensions.

We are again involved in the integrated facilities issue such as we were in the pretreatment area, and so we would like to see the guidelines stating that the industry meet the requirement 3 years after the final regulation of the integrated facility promulgated.

Moving on to best available technology, BAT limitations should be required only where there is a significant toxics problem. "Significant toxics problems" should be defined as those where BPT standards or limitations are not providing sufficient protection to the receiving waters and where further abatement would have a measurable effect on receiving waters.

Situations where a pollutant is present in the effluent solely as a result of its presence in intake waters should not be considered a significant toxics problem. The legislation should provide flexibility so that States and localities can administer reasonable programs.

BPT standards should not be elevated so as to equal BAT or require zero discharge.

BAT requirements for nonconventional pollutants should not be applied unless water quality demands it.

One other point that we are concerned about is the 10-year NPDES. EPA is having a hard enough time issuing permits on the 5-year cycle. We really feel that once an NPDES permit is established, it is quite a firm base on which to upgrade, and therefore a 10-year life is really justifiable.

Nonpoint sources. Uncontrolled nonpoint source pollution continues to present a major, nationwide water quality problem. This message is emphasized in the 1976 report of the National Commission on Water Quality, and more recently in 1981 report of the

House Investigations and Oversight Subcommittee of the House Committee on Public Works and Transportation.

Very recently, it has been confirmed by 6 of the 10 EPA regional offices. The 1981 report notes the attainment of the act's goals "is highly dependent on the degree to which nonpoint source pollution can be controlled."

Section 208 of the 1978 act provided Federal grants to State and local units of government to develop programs to control, among other things, nonpoint source pollution. To date, most States have developed programs for implementation of these programs at the State and local level. However, implementation of these programs has local government fiscal constraints.

Mr. ROE. The gentleman from Wisconsin.

Mr. MOODY. On that point, this is an important part of our bill. Does your association feel that, and I don't mean to put words in your mouth. I have heard others say this. You can spend money until you are blue in the face on point source and if you totally ignore nonpoint, you are getting very low yield for your dollar.

If you spread the effort across the two, you get much more back for the buck.

Mr. JENSEN. That is exactly correct. We are finding that the nonpoint sources are a very large contributor of materials in the water and that where municipalities when they come up to complete speed for meeting the requirements of the act, and industry is quite well along there, really squeezing them down much more, is not going to get much more pollutants.

Mr. ROE. If the gentleman would yield, that is the major issue that we are dealing with, having to do with the previous administration and Mr. Ruckelshaus trying to promulgate different sets of water quality standards which led to the waiver situation in the last legislation, which led to 100 or thereabouts—116 sticks in my mind.

Communities along the Hudson were saying: Well, if the Hudson River is going to be a dead river and we are not going to be doing anything to improve it, then we will not go into any secondary treatment at all. So the 116 communities stopped everything they were doing and a number of them applied for waivers, and thank God none of which were approved.

So I made a note to myself and Mr. Moody brought it up. Your point is if we are going to do something on the capability of receiving waters and we know that 50 percent of the pollutants from different studies indicate that it is nonpoint source, there is no reason necessarily to relax the other, but we are looking for that.

All I am trying to get at is if we go down and measure a river, and because the Federal Government and EPA have not directed their attention to the nonpoint source, there is no reason to say we will let that drip and then we really should not be doing too much more to clean up point source if it is not going to be effective.

I don't think the two necessarily are synonymous in the thought process. What we have to do is tighten up on the nonsource.

Mr. JENSEN. That is correct.

Mr. ROE. You don't object to that.

Mr. JENSEN. I don't think we should give up on water quality of a river. We should go to where the majority of the pollutants are

coming from. If that is nonpoint source, let's get the show on the road.

Mr. ROE. OK.

Mr. JENSEN. NAM's members remain committed to making nonpoint source control programs work at the State level. Consistent with overall budgetary constraints, NAM supports continued provision of Federal funding mechanisms to implement State and local sources.

Mr. ROE. Let's deal with that. You made two statements and you spoke on page 11 in the last paragraph on nonpoint source; "However, implementation of these programs has local government fiscal constraints."

Earlier in your testimony you spoke to the issue someplace along there on fiscal constraints, which is one of our concerns. Let's deal with that a minute.

When the committee wrote this legislation in 1972, we pretty well identified what qualitative dollars we thought would be needed. At best, we knew at that point to bring our municipal plants into compliance with permanent secondary treatment in particular.

In the last couple of years the decision was made regretably to reduce the matching point to 2.4 which has materially delayed the program in our judgment, at least 10 years. This also puts a constraint on industry as far as their nonpoint source discharge would be involved or their discharging into the municipal system.

Let's take a case in point, the Camden regional sewage program, which is not yet completed and is a $4.5 million program. You don't discharge into it, but there are firms that discharge into that particular system.

If they are constrained at every level, it is going to be 7 or 8 years before that regional plant is completed.

So when we get to the pretreatment issue that we were discussing earlier, if that discharger is going into the municipal system, that is all botched up because the municipal system is not going to be completed for another 7 or 8 years because of the lack of funding.

We had testimony yesterday of the organization on the training part of the program. There is a shortage of qualified, capable people who have been trained in this field.

That is also slowing the issue down. When we cut back on the funding at the Federal level and the locals either can't or won't put up their matching shares, that delays the whole program again.

What I am leading up to is, for example, in the Howard bill and the other bill, they are urging Congress to make a recommitment financially simply because we are dealing in a process of time and space and if we don't get the plants constructed for secondary treatment, we are slowing the whole process down.

Would you just speak to that? You spoke to funding. Do you think that on a priority basis that if we are going to do the job, it ought to be done in water supply and water quality and we ought to have the funding to achieve that goal at all levels?

Mr. JENSEN. We are not advocating getting into another grant program.

Mr. ROE. How do you suggest we finish the job?

Mr. JENSEN. We are looking at educational programs and training programs for establishing, (1) an ethic across the country in this area in the municipalities and we are also looking at the programs for land use planning much as is done for flood control, for example, and zoning requirements so that there could be a best management practices established by the States and each State has a different need, a different requirement for these.

These kinds of management practices are set up by the States and then locally rolled out in the communities.

Mr. ROE. Let me digress again. Yesterday when the National Engineers Association testified, they came back and said, well, we don't really think we should have any grant program. We would like to do the financing differently and what we would like to see you do—meaning the Congress—is to put in a 100-percent loan program.

It took a little time to get that out. A 100-percent loan program with an interest rate of around 5 or 6 percent, but that would be economically more technically feasible for regions in municipalities and States to deal with than the grant program because they felt in part the grant program might come to be an end in itself.

You and I both know that if we are going to build some kind of pollution controls and equipment in the plant you have to spend your money and if your goal is to build sewage disposal plants and systems, somebody has to spend the money.

The money has to come from someplace. So what your testimony speaks to is that because EPA has not promulgated the regulations, I think that is the real hole in this operation and because of the fact we have these multiple decisions to make that we should spread the time out or not put any time limit at all or we will never get the job done.

Somebody, someplace has got to make an investment in the system if it is going to get done. We don't have the right to say to the industries, well, look you guys have to do all this free treatment, but it does not matter whether you do it or not because we can't finish the construction of the receiving plant in the first place.

It is going to take another 10 years. So if we are following any kind of logic someplace, somewhere, somebody has to make an investment. Now, we don't want a grants program.

We don't want a loan program. How are we really going to get it done? I don't mean this unkindly to you, but we are so tired.

The people come before us and say we have the work ethic. We know what the pollution situation is. Our States have 63 highly toxic issues, the most in the Nation and we are coming back and saying, well, what do we do? Is there some innovative approach that you would have?

In other words, what do we do? We can't keep delaying and delaying and delaying and delaying. It is not going to get achieved.

You see what I am trying to get at? We are not talking about any Federal grant money. You say, OK, we have a balanced project. Should the water supply of the Nation be a priority?

We have to get it done. How do we get it done if we don't do something?

Mr. JENSEN. I don't think all these controls or management practices are really capital. They are more operating practices.

Mr. ROE. We are going to come to your plant. They are talking about opening the paper company again. We just approved a $180 million diversion on the Passaic River over to Bergen County.

The quality is essential up above the dam because that is where the water supply is taken from. Do we allow it to be toxic or do we say we have got to clean it up?

In order to clean it up, somebody has to spend some money in some processes to get that done is what I am trying to get at. That means an investment someplace both in plant improvement and in municipal governmental sewage disposal system.

So if we don't make the adjustment, how are we going to do that? That is a legitimate question to ask. What would you say?

You don't think because they are going to zone something out in Morris County that it is going to change the pollution of the Passaic River by any chance?

There is not a chance in hell of that happening. We can't go back to septic tanks.

Mr. JENSEN. What I am saying is a lot of the sources of nonpoint in the urban area is runoff from streets and the fertilizers and things of this nature and I don't advocate a treatment facility to correct that.

Let's go to the source of it. The street sweepings or practices like that.

Mr. ROE. If the gentleman would yield, I don't mean to be obstreperous, but you gave a good rundown of what the quantitative uses of waters were and made the point of view that water supply is essential.

This committee is not just handling the Clean Water Act. We have there other major pieces of legislation, flood control and other things that we are working on, but you comment in your testimony that of the 1,300 enterprises related to the NAM, you mention 158,000 smaller industries which was good testimony.

You mentioned that the preponderance of the water supply is used as passthrough. You mentioned that by contrast, water use for irrigation and agriculture runs a lesser degree of value, is highly polluted and consumes about 80 percent of the water use.

We know that a statement of fact, but the fact remains what would you suggest we do as far as the food supply is concerned?

What I am trying to get across to you is that the committee is charged with putting together a national water policy. That is what we are trying to do.

What I am trying to get out of you as far as NAM is concerned, what is NAM's position? Is there a position yet as to what fiscal resources and what method of financing we should be committing to this process?

You make the statement that we should not be going into further grant programs and you make the statement that part of our delay is the fact that EPA has not promulgated all of their regulations. We are coming back on the financial aspect and saying the locals really don't have the resources to do it or are not committing their resources. What does NAM think we should be doing as a people, as a Congress?

How should we be providing the funding?

Mr. GILDE. You raised the issue of Camden.

Mr. ROE. Only because I am knowledgeable of that problem.

Mr. GILDE. In a sense, it identifies some of the problems that have occurred, not necessarily giving total answers to the future. But Camden County started out in the late sixties with a program.

In 1972, they had two different regional plans for the entire county and had one of the regional plans 50 percent designed when along came new legislation which started a number of things rolling.

Mr. ROE. I agree.

Mr. GILDE. And created tremendous delays. There are an awful lot of political ramifications to the whole thing, but that program initially would have been executed by 1975 or 1976.

The State stepped in in 1972 and requested that both agencies, the two in the county, form into one and then in order meet all new Federal requirements and State charges it was stretched out until just recently.

Now, you mentioned that they had a $400 to $500 million program. The old program back in 1972 for just the one basin in Camden County was about $80 million. Most recently the State has stepped in again and said, you really should not be having all in one system but divide up the county again. So the State's approach to it most recently is to say, OK, where are we going to get the most pollution removed for the least amount of money and on that basis have redivided the county again to give the $130 million to take care of the most pollution.

Now, that is not answering all of your question.

Mr. ROE. No, but I know what you are saying.

Mr. GILDE. It is a direction. Unfortunately, we have done some things in the past that have held off getting jobs done and we certainly don't want to do things now that will cause more delay but I think what is needed here and what would have helped in the past is this ability to act with flexibility both at the State level and at the local level.

Mr. ROE. Assuming the State would have done it. They waited 10 years.

Let me try to cut it back. Maybe we have got two ships passing in the night. Are you talking about no grant funding as far as nonpoint sources involved?

You started to talk about parking lots and zoning and so on. You are speaking of the issue and that would relate to things beyond point source.

The present program is point source so far as our funding is concerned.

Mr. JENSEN. Yes or nonpoint.

Mr. ROE. May I suggest this—and I don't want to take up too much time with this—I think it would be awfully helpful to us. I happen to believe that your organization is an extremely important one because you are speaking for the industrial community of the Nation and that is why you are on first today.

But I think it would be extremely helpful for this committee for you—after we finish your technical data today—for you to come back to us with supplemental testimony.

What do you see from a financial point of view? Never mind the intricacies involved. What kind of commitment does industry feel that the Government and themselves should be making financially?

Because let me tell you we are trying to strike a balance with the achievable. We want to get a job done. We don't want more hearings and more rhetoric.

Let's get something achieved. Everybody wants that. But we have this situation now where one group is saying stop everything and other people saying, well, we have got a confrontation. Maybe that is unnecessary in part, but it would be helpful to the committee to have the National Manufacturers Association come back and say we reviewed the financial situation here. We recognize it is going to cost money and that is why we are here.

You are presenting your case not only based upon the pollution control aspect, but what it is going to cost to get it done. Can't we be competitive, that is what you are saying.

We don't want to be treating for treatment's sake. We are trying to look for a new view here. For example, some of the members have promulgated the idea that if it is retrofit that is involved, we understand what that is about. If it is retrofitting a plant versus the point of building a new plant, you have got the tax investment credit situation and the whole bit.

Many instances you might say, scrap that plant and let's build a new one, because on the financial basis it is going to cost you less to do that to meet these new means than it would be to retrofit.

But then maybe NAM should be coming back to us and saying, well, if we have another mechanism, let's assume we had a writeoff of 3 years or something of that nature as a tax credit against retrofitting some of these plants to achieve these goals.

This would give us a different posture and a different view as to what the overall posture would be.

So I think it would be helpful for us after we call you back and you have had a chance to review and say what financing you think we should be doing at Federal, State, and industry level. What thoughts do you have in that direction?

Mr. JENSEN. Great, we will be sure and do that. I think it is very good because we were looking at many different issues and we did not really get that well focused in on this one.

I thank you for the opportunity.

The remaining part of my testimony relates to the program for nonpoint sources. Why don't I just hold those and leave them in the subsequent testimony?

Mr. ROE. Let's go to your recommendations on page 12.

Mr. JENSEN. On page 12 I do have six points rolled out as recommendations, yes.

In prioritizing and setting up the nonpoint source problems, we think these six points should be guidelines.

One, new efforts to deal with nonpoint source pollution should concentrate first on identified problems with attainable solutions.

Two, primary responsibility for developing and implementing nonpoint source controls should continue to reside at the State and local levels.

Three, States should be afforded broad flexibility in developing the types of nonpoint source programs that address the particular problems in each State.

Four, the Federal role in nonpoint source pollution control is best carried out by providing technical and financial assistance to the States.

Five, positive initiatives, rather than financial sanctions against nonpoint sources, will have the greatest impact on improving water quality.

Six, completed and approved section 208 plans should serve as the starting point for additional efforts to control nonpoint sources pollution.

In conclusion, the Congress has an opportunity in the course of reauthorizing the Clean Water Act to make a number of changes that would facilitate the achievement of better water quality in the country.

The changes we have suggested would simplify and streamline the law, giving it greater flexiblity and creating a true Federal-State partnership. We support the extension of the act for 2 fiscal years after which Congress would review the program. We question the wisdom of reauthorizing the act for 4 or 5 fiscal years.

Also, Mr. Gilde has one point that he would like to make on pretreatment.

Mr. GILDE. Going back to pretreatment. NAM is in favor of a pretreatment amendment which would prohibit EPA from requiring cities to impose pretreatment requirements on industrial dischargers of conventional pollutants as a substitute for adequate municipal treatment.

We are concerned. This is not an argument for not having pretreatment. With compatible pollutants you should have pretreatment, screening, grease removal, and things like that, but industry has gone a long way in recycling and reuse of water so that the concentrations in wastewater increase. It will not do the country any good to be having biological sewage treatment plants by industry inside of cities. We feel that there has been some movement in this direction to try to have those with compatible pollutants such as dairies, food processors and so forth, go to biological treatment which is not to the benefit of the community or the industry involved.

Mr. ROE. Are there any questions for the panel?

Mr. EDGAR. Thank you, Mr. Chairman.

I apologize for coming in late. There is another committee meeting. I did have a chance during the questioning to read through your statement and I have three specific questions.

One was covered by the chairman, which is point five of your page 12 testimony where you talk about positive initiatives and I think the chairman is right in asking you to be more specific.

But I have some real problems with page 12 totally. Your testimony is not bad up to page 12, and then you lay out as your principles six points. If I read those six points right, three of the six points say that what the National Association of Manufacturers would like to see is that for nonpoint source pollution let the States handle it with little or no responsibility of the Federal Government

except for maybe some technical assistance and some help in that way.

Let me ask some very specific questions. Do you have any members of your association from Pennsylvania?

Mr. JENSEN. Yes.

Mr. EDGAR. Do you have members of your association from Maryland?

Mr. JENSEN. Yes.

Mr. EDGAR. Let's take a point source problem that has been identified and that is the pollution and increased pollution in the Chesapeake Bay. Suppose Pennsylvania, Maryland, and Delaware were going to address that problem of the Chesapeake Bay and the nonpoint source pollution that is causing catastrophe in that area and we did exactly what you said.

That we gave primary responsibility for nonpoint source pollution to the States and that we should give them broad flexibility of the States and that the Federal role should only be in terms of technical assistance.

Suppose we made a major study of that and it was determined that it would cost $150 or $200 million or more to clean up the Chesapeake and that the technical answer to that problem was to put certain controls on nonpoint source pollution in Pennsylvania, Maryland, and Delaware.

Suppose Pennsylvania, the State where I am from, said no, we like our agricultural runoff into the streams and if it causes problems for Maryland, so what. Suppose some of our cities up the Susquehanna River decided that they did not care very much about keeping certain standards of pollutants and we are going to just flush it down the Susquehanna River and let Delaware and Maryland handle the problem.

How do you in any of your principles get to that problem?

Mr. JENSEN. The reason for the principle statement was not for the joint issue that you pointed out. We were trying to make the point that conditions in Arizona are not the same as in Minnesota.

We were trying to regionalize a program so that we would not have a broad, uniform program across the Nation and try to tailor the management need to the individual weather and geographical region.

That is why we thrusted the program as we laid it out. We did not address the coordination, and you are very correct. We did not address the coordination between the two States going into the same body of water.

Mr. EDGAR. I just pointed out to you that if you have a problem in South Dakota in the Missouri River water system and it impacts on Iowa, Nebraska, Missouri, and all the States downstream, I think what you have done is you have brought business principles to this analysis and you are really basically saying we want to deal with nonpoint source pollution the same way we dealt with point source pollution, in a sense, dealing with it plant by plant and State by State.

I think, given the interconnectedness of our water systems, our underground aquifers, the problem of increased infiltration of hazardous substances into our waterways, it is going to be difficult for us to have a State specific solution to these problems.

We may give the States more responsibility and more funding for those problems that are internal within those States, but my guess is with nonpoint source pollution, there is more interstate involvement needed.

Mr. CANNON. I would like to add, it has been our experience in situations of the type that you describe that the interstate compact organization is the most viable device. One outstanding example of this is the Ohio River Valley Water Sanitation Commission in which eight States joined together to form an interstate compact and commission type organization on which the Federal Government is also represented.

Over a period of years they have carried out a cooperative program which has resulted in dramatic improvements in the water quality of the Ohio River. Something like 138 species of fish have returned and in a great many ways, both industrial and municipal pollution have been cut back by very substantial percentage points.

Another example is the Delaware——

Mr. EDGAR. If I could interrupt you, I would recommend that that be one of your principles.

Mr. CANNON. Well, thank you for the suggestion.

Mr. EDGAR. I think if we are going to talk about nonpoint source pollution and we have some ideas in terms of where it is working, I would suggest that.

Let me ask you one final question. There may be others who have questions. On page 2 and 3 of your statement you make a very good comment that water is indispensable, water is not a free commodity.

I wonder if you would have any sense as to what the real cost of water is, what is the cost of water to your organizations and businesses that are part of your manufacturers. How much does it cost them for a gallon of water?

Mr. JENSEN. That really depends upon the intended use of the water and obviously water for use in a direct food contract processing has to be a higher quality than for cooling water and it also depends upon the availability of the water, so I really can't answer that as far as one number.

It is over a very wide range of values. I know in my company for the same intended use, it varies from location to location and that is seen in whether we use noncontact cooling water or we use a cooling tower.

Mr. EDGAR. I raise that question because I think in 1973 when the Arab oil embargo occurred which was 10 years ago this week, many businesses were shocked, as they began to develop their business cycle based on higher costs for industry than previously and there has been a real shakeup for businesses.

I have a suspicion that toward the year 2000 there is going to be a similar shakeup as businesses begin to adjust to the adequacy of quantity and quality of water within the worksite and the statistics that you list, it occurs to me that we are going to have a real crunch if small- and medium-sized businesses don't recognize that water is going to have a higher cost to it in the future than in the past, not just in terms of purifying that water and placing water supply networks that are aging, but also in terms of the value of that water to the process.

Mr. JENSEN. Yes. There will be a shocking realization or crunch, as you say. We are beginning to see that. We have been seeing it for years in southern California and Arizona as more and more people in businesses move into there.

There just is not that much water available. People live a different lifestyle there than they do, say in New England.

Mr. EDGAR. I have some legislation that the chairman is supporting and has bipartisan support to set up a national ground water commission to look at quality and quantity of our natural ground water supplies in the future.

The chairman has an omnibus water bill that is trying to address the issues of quantity and supply and we have this effort in a Clean Water Act and others to try to make sure that we have water and supply.

I just think that many businesses who legitimately say let's get Government off our backs and out of our pocketbook, let's cut spending and taxes and increase defense, and all the other problems that our society faces will solve themselves, may need to readdress the issue of whether or not a national water policy is needed that at least has pieces of it that help in a broader view than just a site-specific problem that an industry may face in one part of the country.

That is why I press so hard on the interstate, interconnectedness of the nonpoint source pollution problem. I think I agree with the chairman. I am not sure that that can just be solved by what you title in point 5 of page 12 as positive initiative and if you have got some magic positive initiatives that will tell that businessman in Delaware County, Pa., to behave himself in relationship to nonpoint source pollution that is going to solve the problems of that whole region, I would be glad to see what they are.

I know businessmen in terms of incentives, they would be more likely to respond to a tax incentive of some kind or some joint Federal/State/local business cooperative venture.

Mr. JENSEN. That is what we had in mind.

Mr. ROE. The gentleman from Pennsylvania.

Mr. CLINGER. Mr. Jensen, in your testimony you discussed the recent third circuit decision which suggested that we do not have legal authority to grant fundamentally different factors and variances. It is my understanding that there is a conflict within the circuits on that issue.

Are you aware of whether any other circuits have addressed the issue?

Mr. JENSEN. No. I can't respond to any other circuit, no.

Mr. CLINGER. You are just aware of the third circuit?

Mr. JENSEN. Correct.

Mr. CLINGER. I was interested particularly in your testimony involving the problem of integrated facilities, I think is a valid point and I think it is obvious that there are real problems under existing law of how you handle integrated facilities.

Can you give us an idea and perhaps you can provide this for the record of how many of your members have integrated facilities?

Mr. JENSEN. I will be very glad to do that. I don't have that number off the top of my head, but I know my company, if it is a test case, about one-third of our plants are integrated.

Mr. CLINGER. About one-third. It would be helpful, I think, if you could provide us with as much background data about the nature of the problem, if there are any studies that have been done or technical information as to how you are unable to really comply because under existing law with the requirement?

Mr. JENSEN. I know people from General Motors have told me that essentially all their plants are integrated facilities. There are 100 and some plants in the United States.

Mr. CLINGER. I guess the final question in that line would be to what extent is the problem of integrated facilities really a function of the number of categories involved in the integration?

How many different categories are part of that integrated facility?

Does the problem expand with the number of categories involved?

Mr. JENSEN. Yes, it will. That is for sure.

Mr. CLINGER. Your testimony also discusses the issue of water quality standards and the position that designated uses should not be frozen as of any particular date. It is too rigid to just freeze it and lock it in forever.

I think in terms of addressing that issue in our legislation, it would be extremely helpful if you could cite a specific example or if you had a specific example that would indicate why the committee should not freeze designated use. Why is that a real problem?

I would like a specific example of where that could be done.

Mr. JENSEN. Well, there are a number of States. Let's just take for example Puerto Rico. All the water in the State is designated as drinking water supply and there are places in there that you just physically can't make it a source for drinking water supply and yet the dischargers are required to meet these stringent standards and the natural configurations of the water you would not want to make it a drinking water supply.

Mr. CLINGER. That is the sort of example I think that would be helpful.

Finally, in connection with the chairman's request that you give some thought to who is going to pay and how we are going to pay for this, if you would include in that analysis what you might think of some sort of an infrastructure bank either at the Federal level or the State level which, except the fact that we are not going to have any massive new grant and aid programs, one possible alternative would include the mechanism centrally or State administered infrastructure bank which would be available to make loans which would be repaid to the bank and it is kind of a revolving loan fund concept.

NAM would look with favor upon that kind of a concept?

Mr. JENSEN. We will be glad to analyze that.

Mr. ROE. The gentleman from Wisconsin.

Mr. MOODY. I notice, most of your recommendations do, in fact, bear down on the nonpoint source issue. You have implicit recommendations in other parts.

It might be nice to give us the kind of compressed summary of your recommendations across-the-board.

On that point, I think Congressman Edgar is very much correct when he points out that exortations and other things of private ini-

tiatives wouldn't solve nonpoint where you have a combined body of water where various States are feeding into it.

Compacts are one approach, but is that always going to work? It seems to me if you have three States polluting, let's say, the Chesapeake Bay and the cleanup, if they agree to a compact, maybe a burden very much more on one than the other two, and that State has a systematic incentive not to sign such a contract.

You may not get people to sign voluntary contracts when they recognize the price tag that is going to come down. So maybe there still is a role for some Federal nonvoluntary standards on nonpoint.

I think that your association could make a tremendous contribution if you would help us think through what are the really practical, creative ways of handling nonpoint because I think that is the area where there is least plowed ground.

A lot of the stuff you have gone over we have been hearing. This is really awfully important.

Mr. EDGAR. Would the gentleman yield at that point?

Mr. MOODY. Just a second I will.

I just want to ask you to do that because I think there is a—well, I will yield to my colleague.

Mr. EDGAR. I was just going to say that I think your question is a good one. There is one thing that I thought of since our conversation was the problem that you may have of have and have-not States.

That is certain States that will do a good job technically and will put together good responsible laws that may have a cost to them, but it may be worth the costs to the political leaders in that State.

You may develop a position where some industries that don't want to pay that cost may find it more convenient to relocate their plants in States that are not as stringent in their caring and that is why some of the national rules, regulations, and incentives may have a much more constructive role to play rather than having industries seek out the best deal from the State that has the least protection.

Mr. MOODY. That was my second point expressed in a different way. You know we have tax competition with States competing with each other for lower taxes to attract business into their States.

Under your guidelines you could easily see a pollution competition scenario. We attract industry to States by having lower pollution standards.

They feed into the same body of water, but they have a lower pollution standard. So we would like to have your input on that.

Mr. ROE. Are there any further questions?

[No response.]

Mr. ROE. We want to thank you for your testimony. We have been a little bit longer with you. We think that you had a lot to offer and we want to hear more about it.

So we will look to call you back again for a little more testimony in the areas of our concern.

Mr. JENSEN. Thank you very much. My pleasure.

Mr. ROE. Our next witness is Dr. Alan Mytelka, director and chief engineer of the Interstate Sanitation Commission, accompanied by Dr. Mitchell Wendell, who is general counsel.

I want to welcome you gentlemen to our hearing.

Dr. Mytelka, welcome.

TESTIMONY OF ALAN I. MYTELKA, PH. D., DIRECTOR AND CHIEF ENGINEER, INTERSTATE SANITATION COMMISSION, ACCOMPANIED BY MITCHELL WENDELL, GENERAL COUNSEL

Dr. MYTELKA. Thank you, Mr. Chairman.

I am Dr. Alan I. Mytelka, director and chief engineer of the Interstate Sanitation Commission. The commission is an environmental agency of the States of New Jersey, New York, and Connecticut, established by an interstate compact having the consent of Congress.

Among other things, the commission has jurisdiction of a regulatory character over water quality in the tidal waters of the northeastern New Jersey, southeastern New York, southwestern Connecticut metropolitan area.

Specifically, the Interstate Sanitation District includes the Hudson River from the Bear Mountain Bridge to the ocean, Raritan and Sandy Hook Bays, the waterways of the New York Harbor complex, and Long Island Sound westerly of a line from New Haven to Port Jefferson.

The commission monitors receiving waters and effluents, administers water quality standards, makes regulations containing both effluent limitations and receiving water quality standards, and has authority to enforce its regulations. Its requirements are included in NPDES and SPDES permits.

The purpose of this testimony is to discuss questions relating to estuaries, as they would be affected by proposals to amend the Clean Water Act.

We call the committee's special attention to the final portion of this testimony which proposes inclusion of interstate agencies in conferences for estuaries. Because of the recent course of events, the applicability of section 301(h) to estuaries is also involved.

The provisions of the Federal water pollution control statute apply to the waters of estuaries as well as to other waters of the United States. In fact, estuaries are particularly sensitive parts of river basins and marine systems.

The physical, chemical, and biological balance within them is especially delicate. Estuarine environments are vital for food production. They also provide indispensable habitat for many species of fish and wildlife.

In addition, these areas are among the Nation's prime recreational assets.

At the same time, estuaries are apt to be especially stressed areas. Many of them contain commercial harbors which serve transportation and major industrial centers. These often bring intense pollution concentrations.

It is appropriate to recognize that estuaries have water quality problems of particular complexity and importance. For this reason, it is encouraging that proposals for amendment of the Clean Water

26-955 O—84——74

Act should examine the application of its provisions in estuarine areas.

These proposals deal with the appropriateness of ocean waiver provisions for discharges into estuaries and also with a special mechanism to consider the problems of interstate estuaries.

SECTION 301 (H)

Whatever the pros and cons of ocean waivers may be for the deep coastal waters of the Pacific, they are not illuminating for the conditions in confined waterbodies. The shallows of territorial seas adjacent to inland waters provide much less opportunity for the rapid dispersion claimed as an ameliorating factor.

Within estuaries, the situation is even more adverse to assimilation or dispersion of pollutants. Thus, advocates of lessened treatment for the wastes discharged from POTW's into inland marine waters bear an especially heavy burden of proof.

We support the proposition that applicants for permit modifications who wish to provide less than full secondary treatment for such discharges should be denied, unless they can show convincingly that their proposed effluents would not have an adverse effect on the environment.

Whether their proposed discharges would cause or contribute to failures to meet applicable receiving water quality standards is one test to be applied. However, it is not an all inclusive one.

In the Greater New York Metropolitan Area, and undoubtedly in other places, as well, there are those who seek further to pollute waters that are already below standards. They argue that since the waters are already bad, it will do little or no harm to add pollutants.

Another argument, especially common among small- and medium-sized dischargers, is that their contributions are not sufficient to be noticed or to make any real difference.

If this view had prevailed in the framing and administration of the Federal and State water pollution control statutes, or in the water quality regulations of the Interstate Sanitation Commission, such progress as the efforts of the past 25 years have shown would not have been made.

In major water bodies, and especially in heavily congested and industrialized areas, it is seldom the pollution from one source alone that determines water quality. In the New York-New Jersey-Connecticut region, as in many other places, the condition of waterways is the composite result of many discharges and of the degree of treatment which they have received.

In an estuary it is especially true that the waters interact. They do not always flow from upstream to downstream.

They ebb and flow with the tides and do not disperse or move on as readily as they do in a free flowing river. Moreover, an estuarine system characteristically has shoreline curvatures and indentations which catch and retain contaminants.

Poor quality effluents accumulate. In parts of the New York Harbor area detention times are often as long as 2 weeks or more. In some places, thorough flushing never really occurs.

The Clean Water Act establishes secondary treatment as the universal norm. This represents a now long-standing legislative determination backed by much technical and scientific experience.

The Federal act allows for exceptions, only where it can be demonstrated that environmental harm will not be done and where there is economic and social justification for a relaxation of the secondary treatment requirement.

It stands to reason that in estuaries where the ability of waters to assimilate pollutant discharges is generally much diminished, the availability of section 301(h) waiver procedures raises serious problems.

Legislation before the Senate, S. 431, would increase the difficulty of obtaining permit modifications under section 301(h) by adding criteria to be met by applicants. Such safeguards are worthy of consideration.

In particular, the proposal that relaxation from secondary treatment not be allowed in an estuary, unless good flushing occurs there, has merit.

H.R. 3282 approaches the problem differently. It would make applicants who discharge into estuaries ineligible for waivers under section 301(h). Consideration of estuarine water quality problems—of an interstate character—would be by management conferences.

Since such conferences could recommend water quality standards and requirements for their individual areas, they could consider both general and specific proposals for relaxation of treatment requirements.

The aspects of section 319 of H.R. 3282 which we find most meritorius are the special attention which would be focused on estuarine problems and the additional funding that would be devoted to them.

Since estuaries bear special and unique stresses, and since they are particularly sensitive ecological areas, it makes sense for Congress to show special concern for them in its principal water quality statute.

INTERSTATE AGENCIES AND MANAGEMENT CONFERENCES

As presently conceived, management conferences would have planning and quasi-regulatory functions. They would produce master plans for the estuaries.

The parties to a conference would be a representative of each State in the estuary and the several Federal agencies with relevant water programs.

In the New Jersey-New York-Connecticut region, the Interstate Sanitation Commission exists specifically to handle interstate problems including many of the functions projected for a management conference.

For nearly half a century, the commission, with the specific consent to its compact by Congress, has monitored both effluent and receiving water quality throughout the Interstate Sanitation District. It has made and enforced water quality standards to assure compatibility of discharge requirements and water uses in the interstate waters involved.

The commission has also developed special experience and expertise in dealing with estuarine problems in its area because its entire attention is concentrated on the estuary. Moreover, section 103 of the Clean Water Act expressly declares a congressional policy to encourage interstate compacts as a means of dealing with interstate water quality problems.

We urge the committee to include an interstate agency with jurisdiction over all or a significant part of an estuary as one of the parties to a management conference. Such an agency, wherever it exists, would make an important contribution to such a conference.

Under the Federal Water Pollution Control Act of 1956, which provided for interstate enforcement conferences, interstate agencies with jurisdiction in the area were expressly enumerated as parties along with the States and the Federal agencies.

The Interstate Sanitation Commission participated vigorously and effectively in the conferences on the Hudson River, Raritan Bay, and Long Island Sound. The commission played a leadership role in formulating the secondary treatment principle in its area and in furthering it through these conferences.

So far as we have been able to ascertain, the omission of interstate agencies as parties to conferences under section 319 appears to be inadvertent. In fashioning this part of the legislation, we urge a brief amendment to the section by adding two sentences at the end of the first paragraph of the section, as follows:

In any case where an interstate water pollution control agency, established by an interstate compact having the consent of Congress, has jurisdiction over all or a significant part of an estuary for which the Administrator has convened a conference, the interstate agency shall be a member thereof. In addition to its grant support provided by the Administrator under section 106 of this act, such an interstate agency shall be eligible for and shall receive funds in accordance with this section from appropriations made available pursuant to this section in support of its work.

The proposed management conferences would be given important and ongoing tasks to accomplish. They would need to make master plans suitable for specific implementation.

This would require continuing research and development work, probably over a period of 2 to 3 years—a conference is to have a life of at least 5 years.

Monitoring is expressly provided as a function. To be done effectively, this requires sampling and analysis of waters.

Standards making also requires technical and legal staff work. A conference can oversee such work, but it will need assistance of a concrete nature to perform it. For this reason, the interstate agencies which could serve these functions should not be omitted from the enumerated parties in section 319.

There is one reference to interstate agencies in section 319. It would allow an interstate agency doing work to implement a completed master plan once made and to receive grant assistance for such implementation work.

However, that reference is too limited. An interstate agency with water quality jurisdiction and responsibilities in an estuary should be funded in connection with its work in the same manner as other State participants.

Indeed, in an interstate estuary, an interstate agency is in a better position to do the work contemplated because it is the only

agency—other than the Federal Government—with jurisdiction sufficient to see and deal with the problem as a whole rather than with the territorially limited segments within the individual States.

We wish to commend your committee for having identified estuaries as proper subjects for the special attention that their intricate problems deserve. We trust that these views will contribute to your development of an improved Clean Water Act.

Thank you, Mr. Chairman.

Mr. ROE. Thank you, Doctor.

The gentleman from New York, Mr. Molinari.

Mr. MOLINARI. Thank you, Mr. Chairman.

I'd like to first welcome Dr. Mytelka and Dr. Wendell, who I have the utmost respect for and the quality of their work as well. I have but a few questions and I have to run out to another committee hearing.

You start off talking about the work that the commission does now in monitoring waters and effluents and also you talk about the enforcement authority. It is my impression that your commission has suffered some rather severe financial cutbacks in the last few years from your State contributions, the three States involved.

Could you elaborate on that for us?

Dr. MYTELKA. Well, during the past several years we have not been funded to the extent that is necessary and, in fact, in the past several years several of the States have actually cut back the funding that we had received a few years earlier.

Mr. MOLINARI. Well, OK. I'd like to zero in on that because I'm very, very much concerned. I know the kind of work you do and I know that you are not able to do the monitoring you did before, and for the sake of the record, this is completely unrehearsed. We have not discussed this. But I'd like to get with more certainty what the effects were or what you feel is necessary to properly perform the functions that you were supposed to perform.

Dr. MYTELKA. Our commission should be doing more sampling of, one, the receiving waters, not only for the conventional pollutants but also for the toxic materials which may or may not be present. In that regard it is really necessary for the public to know if, in fact, toxics are not present that, in fact, they are not, and if they are, to the extent they are.

In addition, we ought to be doing more sampling of the effluents of the treatment plants. The local, State, and Federal Government have invested billions of dollars in treatment facilities collectively within our district. It is important to do proper sampling of these effluents to make sure that the treatment plants are operating properly so, if they are not, corrective action can be taken. Otherwise, these tremendous sums of money that have been invested are going to go down the drain.

Mr. MOLINARI. Let me interrupt you if I may, Dr. Mytelka.

I recall reading in the newspaper a statement, I think it was the Times, about the periodic inspections that you make now as opposed to what you used to make. Can you just tell us briefly what those numbers are?

Dr. MYTELKA. Well, in terms of municipal plants we used to visit the major ones four to six times a year and the smaller plants two

to four times a year. At the present time, because of budgetary restrictions, we are able to visit the major plants two to four times a year and the smaller plants once a year. We do try to make sure that we visit all of the municipal plants at least once a year.

In regard to the industrial facilities in our jurisdiction, we have also had to cut these back severely and probably proportionately.

Mr. MOLINARI. But I would like to ask you, with the consent of the chairman—in order to save some time and at the same time have perhaps a more complete statement—would you gentlemen prepare for this subcommittee a detailed statement itemizing the resources that you believe you should have, and incorporate into that with those additional resources what you would be able to do that you are not now able to do.

I've had a conversation with the chairman during the vote and he has been very responsive and we are going to look at it to see if there is some way that we can't come up with a mechanism to provide additional funding. I read with interest your recommendation on the amendment and that is something that I have seen for the first time.

Let me just quickly move on for the sake of my colleagues here who have kindly let me go first.

On the 301(h) waivers, you mention in there that you support the proposition that applications for permitted modifications who wish to provide less than full secondary treatment for such discharges should be denied with the caveat that unless they can show convincingly that their proposed effluents would not have an adverse effect on the environment.

How do you view the application for waivers by the city of New York?

Dr. MYTELKA. Well, as you know, the city of New York as well as municipalities in New Jersey and municipalities in the State of New York outside of the city, some 22 of them did make applications within our district and we looked at each of them as an application, measured it against the requirements needed for it, and we found them wanting and in fact we turned down on first round all 22 applications as not being appropriate.

One interesting aspect. These are not applications only from one State. You have to deal with equities not only within a State but we have three States involved, Connecticut, New York, and New Jersey, because some of the applications from New York would have an effect on the water in the State of Connecticut, and of course the applications of the New York and New Jersey communities would directly affect each other in the Hudson River and elsewhere.

You can't say well, suppose you just give one. Well, which one?

The system has to be looked at as a whole and so we viewed our district as a whole and we have applied the necessary evaluations on a districtwide basis rather than just on an intrastate basis. We came to the conclusion that both the city and the municipal applicants in the State of New Jersey, were wanting and we denied them.

Mr. MOLINARI. Well, I compliment you for that position. I have to wonder what the combined impact would be if all 22 applications had been granted; I don't know that anybody ever did the computa-

tions. I wondered what the result would be of 22 applications of that nature in that relatively small area.

You go on on that page to mention in the Greater New York metropolitan area that there are those who seek further to pollute waters that are already below standards, and the standard argument is that the waters are so bad that what difference does it make.

Do you have anybody specific in mind or can you give us some examples of those that you are talking about here?

Dr. MYTELKA. Well, without mentioning names per se which I don't think would be suitable at the present time, both municipalities and industries, under other provisions of the act, are looking for waivers. In fact, we have requests before us now asking for waivers from the commission's own effluent requirements. This is in addition to the 301(h) waiver.

So when one looks at a request to do less than necessary treatment, it is not only in the section 301(h), it is on all the other waivers and that also has to be taken into account, that it is not just one municipality or industry that is requesting the waiver, they all are. And of course, as soon as this whole 301(h) business came up, we received questions from many of the industries, how do we make the application?

We pointed out of course 301(h) applied to municipalities. Nonetheless, they got busy looking into other sections of the act as to whether they might qualify. So it becomes a domino effect to some extent that has to be considered in looking at the overall picture.

Mr. MOLINARI. Down at the bottom of that same page, you talk about the secondary treatment established by the Clean Water Act as the universal norm and then you talked about the Federal act allowing for exceptions only where it could be deemed that environmental harm cannot be done where there is economic and social justification for relaxation.

Are there such cases in your region where exceptions should be granted that you know of?

Dr. MYTELKA. There are none that, as far as I know, have been granted. When we look at our own regulations we have come to the conclusion that the full degree of treatment required by our regulations is necessary if, in fact, the progress that is already made is going to continue so that we can reach the goals that have been set. Things are much better than they were 10 or 12 years ago but they are not going to get better if we allow backsliding and doing less treatment.

Mr. MOLINARI. I have one last question, Doctor, and this might be a rather sensitive one. But a commission such as yours that is forced to take positions that oftentimes are contrary to that which local governments—and we talk about local governments—like I said, in New York they have a great degree of influence obviously in the State.

Does this not create political problems for you in the sense that you are not doing what the big boys would want you to do and therefore you might find yourself facing some budgetary cutbacks and less able to do the job that you had the responsibility to do.

Dr. MYTELKA. Well, I can't say that our budgetary cutbacks have been due to that reason. I would say, however, yes, sir, when you

are dealing in an interstate area, you are first of all dealing, and we are dealing with the interests of three States.

We are also dealing with interests of large municipalities or regional authorities such as the city of New York, the Passaic Valley Sewerage Authority, and the Middlesex County Utilities Authority and so it is a difficult situation. All one can do is look at the situation, look at the regulations, call the shots as you see them and let the chips fall where they may, and that is what we have done.

Mr. MOLINARI. Would you be able to function better though, the bottom line question, if your funding came directly, let's say if it could be arranged, from the Federal Government and of course then that share would be cut out of the appropriation for the individual States?

Dr. MYTELKA. Well, we certainly think that additional funding is necessary. I am not sure, however, that I would favor being exclusively funded by the Federal Government and not by the States.

We are an interstate agency. We are an agency of the States and in this case we are able to bring to bear on our particular estuary, in our district, a perspecitve from an overall State point of view that may not always be in tune with an overall national perspective.

Did you have something you wanted to add to that?

Mr. WENDELL. Yes, sir, I wanted to add a couple of things, Mr. Chairman and Congressman Molinari.

In the first place, on the matter of political sensitivity, which you quite properly raised, this is really exactly why a commission such as ours exists. The business of attempting to reconcile sometimes divergent views among those who have under their control only part of an area is, by its very nature, a controversial one. Yet it is a set of problems which have to be solved.

There was reference when the previous witness was being questioned, to this very fact in other parts of the country, and it is not only a situation that exists in our region. We point out here particularly in our testimony that, where an agency such as ours does exist, it should be supported if you are dealing with interstate problems, because we do have experience in attempting to do this.

Now, you are quite right, Congressman. It is not easy. If it were easy perhaps there would be less need for us.

On the matter of funding, I think we have suffered most in recent years from the general cutbacks that have been in this area, or perhaps one would say from the failure to keep pace with inflation.

This is a universal problem. It is one that we face particularly because we are a small agency. We don't suggest that we ought to be a big agency. We don't want to duplicate what the States do, but there are particular interstate functions and roles here and you are quite right, Congressman, it is difficult to recognize because it does not fit the normal Federal, State, single State, single Federal Government relationship. But it is a very real problem.

Mr. MOLINARI. Well, I thank you.

I have seen some examples where you gentlemen have stood up to some very controversial subjects where we had some very powerful, powerful figures, mayors, Governors, and some of them, when they don't get their way, have a tendency to find retribution by

cutting your staff down. I know we have seen this too many times and with an agency like yours that concerns me deeply.

Mr. Chairman, I thank you.

And I thank the gentlemen for your courtesy in letting me proceed out of turn and I'd like to pursue a conversation with you after we receive your report.

Mr. ROE. That is fine.

Are there any further conversations with these witnesses?

[No response.]

Mr. ROE. Doctors, you have been very helpful. Thank you very much.

[Subsequent to the hearing, the following was received from Dr. Mytelka:]

NEEDS OF THE INTERSTATE SANITATION COMMISSION

The Interstate Sanitation Commission has both air and water quality programs. Both could be usefully expanded in order to meet the evironmental needs of the Greater New Jersey-New York-Connecticut Metropolitan Area. Because of the context in which this information was requested, only the water quality program is discussed.

Basically, the functions and responsibilities of the Commission are in:

1. monitoring of treatment plants,
2. monitoring of receiving water quality,
3. development and maintenance of a data base from which localized and regionwide environmental analyses can be made,
4. making regional water quality analyses, and
5. making and enforcement of interstate standards and requirements for the purpose of promoting regionwide compatability in the use of the common interstate water resources.

MONITORING OF TREATMENT PLANTS

The Commission inspects and samples Publicly Owned Treatment Works (POTWS) and industrial treatment facilities throughout its District. It analyzes the effluent samples for compliance purposes. Its reports of inspection and analysis results are provided to the treatment plant, the state in which the plant is situated, and to the U.S. EPA. Of course, the Commission also uses the information in its own regulatory program.

To be effective, such monitoring should be at least three to four times a year for POTWs and industrial facilities having outfalls independent of the public sewer systems. Before the current budget stringencies, the Commission met this program level for POTWs, but was not able to achieve it for industrial facilities. At present, treatment plant inspections and samplings for POTWs are mostly at the rate of twice a year for POTWs and only a total of 15 a year for industrial dischargers. The POTW visits need to be restored to their previous level and industrial monitoring should be increased to 100 sampling visits a year.

RECEIVING WATER MONITORING

The Commission has regularly sampled and analyzed the waters of the District. It formerly did so on boat runs which traversed much of the District waterbodies. These were done once a month in the winter and twice a month during the rest of the year, for a total of 18 separate monitorings a year. For reasons of efficiency in the use of personnel time and preservation of samples until they are brought to the laboratory, this work is now done by helicopter. However, the Commission can now afford only four traversals a year. Further, the outlying portions of the District were never included. The program should be expanded to restore the frequency previously maintained and to cover the entire District.

REMOTE AUTOMATIC MONITORS

Receiving water sampling from boats or helicopters is versatile in that it can cover both surface and bottom conditions and can traverse the waterways from shore to midchannel and from end to end. However, the sampling thus accomplished

and the attendant analyses are only of conditions at the discrete times when the boat or helicopter runs are made. Remote automatic monitor installations can make a continuous record of water quality conditions at the points where the equipment is installed and of water flowing passed the installation. The Commission has never been able to operate more than seven such monitors and has more often operated only three or four. This has been useful, but woefully inadequate for the size and diversity of the Interstate Sanitation District. To service the area of the Hudson River from Bear Mountain Bridge to the sea, the waterway system of the Greater New York Harbor, Raritan and Sandy Hook Bays and western Long Island Sound, 20 remote monitors should be installed and operated. The capital outlay involved would be on the order of $240,000.

It is necessary to report that within the past two months, the Commission has temporarily suspended continuous operation of its several existing remote monitors because of lack of sufficient funds. Also, its remote monitors are 20 years old and in serious need of overhaul or replacement.

CAPITAL EQUIPMENT

The Commission operates an environmental laboratory for the doing of the analytical work associated with its monitoring programs. This facility is also essential for the special projects which the Commission conducts from time to time in order to investigate particular conditions relating to the waters of part or all of the Region which it serves. A current example is the additional coliform studies which it has undertaken to ascertain what would be needed to open Raritan Bay as a reliable source of shellfish on a year-round basis.

The laboratory is in need of additional and replacement equipment. The last time it was outfitted with up-to-date major pieces of equipment was 12 years ago. Many of these items are either wearing out or becoming outmoded.

A particularly serious gap in the Commission's laboratory capability is its limited equipment for the analysis of samples to determine the presence of toxic substances, especially organics. To do this work effectively, a Gas Chromatograph-Mass Spectrophotometer is required. Once acquired, this instrument would serve for many years. However, its purchase price is approximately $150,000. The Commission has the personnel capability to make use of this instrument, but it has never been able to afford the capital outlay. The monitoring programs also produce many samples which should be tested for toxics but which are not now so analyzed because of the lack of a suitable instrument.

Examples of other major equipment needs are automated nutrient analysis instrumentation and a carbonaceous analyzer. Further, expansion of the Commission's field force which would occur if funds were available to do the monitoring proposed above, would require field equipment not now possessed by the Commission in sufficient amounts.

PERSONNEL

Additional field and laboratory personnel would be needed to expand the monitoring programs. However, some augmentation of professional and office support staff would need to accompany the higher program levels contemplated in this presentation of Commission needs. Assuming the increased activity projected here, the Commission should add an engineer, an environmental planner, a researcher and an attorney. It should also add two employees to its present office support staff which is composed of only four persons.

PHASING OF INCREASED ACTIVITY

While all of the deficiencies identified in this memorandum detract seriously from the work that the Commission should be doing currently, it is recognized that the increases proposed here would constitute an addition on the order of 70 to 75 percent in the organization's level of activity. Such an increase could not be accomplished efficiently within a few months. Thus, it should be considered that not all of the funding indicated would need to be available in a single year.

FUNDING REQUIREMENTS

The needs presented here do not involve the inauguration of new programs or the assumption of new responsibilities. The subject is the remedying of deficiencies which now prevent the Commission from accomplishing its agreed missions with the requisite degree of effectiveness. Accordingly, the funding indicated below would be

in addition to the appropriations from the member states and the U.S. EPA grants to the Commission under Section 106 of the Clean Water Act.

The needs are of two kinds:

1. increased operating funds, and
2. onetime capital outlay funds.

Some agencies are able to satisfy their capital outlay needs by saving enough from their income to build reserves from which large expenditures can be met. As with most governmental agencies, the Commission does not have reserves to serve any such purpose. It relies on annual appropriations and grants which have never been large enough to make possible the purchase of costly capital equipment from current funds. Listed below are dollar amounts which represent in funding terms the needs just discussed.

Increased operating funds (including overhead): 13 employees (per year)	$600,000
Onetime capital outlay funds:	
Gas chromatograph-mass spectrophotometer	150,000
20 remote monitors (including installation)	240,000
Automated laboratory equipment (including instruments for nutrient and carbonaceous analyses)	50,000
Equipment and transportation for field personnel	40,000
Total	480,000

Our next witness is Mr. Buddy Beach, vice president for environmental affairs, Consolidated Coal Co. and the American Mining Congress in Pittsburgh, Pa., and chairman of the AMC's Water Quality Subcommittee.

I welcome Mr. Beach to our committee.

TESTIMONY OF BUDDY BEACH, VICE PRESIDENT, ENVIRONMENTAL AFFAIRS, CONSOLIDATED COAL CO., PITTSBURGH, PA., AND CHAIRMAN, AMC'S WATER QUALITY SUBCOMMITTEE

Mr. BEACH. Good morning.

My name is Buddy A. Beach. I am vice president of Consolidation Coal Co. for environmental affairs, and chairman of the American Mining Congress Water Quality Control Subcommittee. This morning I am representing the American Mining Congress, a national association of companies that produce most of the Nation's supply of metals, coal, and industrial and agricultural minerals.

We appreciate the opportunity you have extended to us, Mr. Chairman, to express the mining industry's views on Clean Water Act amendments. Most of the facilities in our industry discharge effluents to waters of the United States and are directly regulated by the Clean Water Act.

AMC supports the purposes and basic structure of the Clean Water Act. As an industry, we have faithfully complied with the act's mandates, expending large sums of money to do so. Our mines, mills, smelters, and refineries have achieved a very good record of pollution reduction through compliance with the act's technology-based standards. It is out of the industry's extensive experience with the provisions of the act that we make recommendations for amending it, not to weaken it but to make certain provisions more workable.

Due to the schedule on which EPA has been promulgating its technology-based effluent limitations guidelines for industry categories, it is inevitable that the compliance deadlines in section 301 of the act must be extended beyond July 1, 1984. For example, it will be at least late 1984 before phases I and II of the regulations for nonferrous smelters and refineries are promulgated.

The deadline for compliance must be extended to permit regulated facilities sufficient time to raise the capital and acquire and install the technology necessary to meet the prescribed limitations. AMC favors extending the compliance deadlines to at least 36 months from the date that the pertinent effluent limitations guidelines become effective.

When Congress wrote the Federal water pollution control law in 1972, it rightfully recognized that, for various reasons, not all surface waters could be upgraded to fishable-swimmable levels of water quality. Accordingly, section 303 of the Clean Water Act directs the States to establish water quality standards to protect public health and enhance water quality, taking into account the stream's existing uses and values.

Furthermore, in section 303 and 304, Congress directed that the standards are to be based on national water quality criteria that reflect the latest scientific knowledge and take account of multiple use of the waters.

These statutory provisions, however, were implemented in an inflexible way. In response to Federal pressure in the form of the act's fishable-swimmable goal and EPA's policy of presumptive applicability, States set unrealistically high use classifications for various streams and applied the national criteria automatically, irrespective of a stream's particular characteristics.

More recently, EPA has revoked its policy of presumptive applicability and proposed regulations that would assist States in establishing use designations suited to the characteristics of a particular water body and in modifying national criteria based on site-specific conditions.

AMC favors this realistic and scientific approach to the setting of State water quality standards. Congress should take care that any Clean Water Act amendments preserve State flexibility in setting standards that take into consideration a water body's use and value for public water supply, agricultural and industrial purposes, propagation of fish and wildlife, and the like. States should be encouraged to develop criteria and standards that reflect the site-specific nature of particular water bodies.

AMC recommends that ephemeral and intermittent streams be exempted from water quality standards. The imposition of water quality-based effluent limitations on streams without careful consideration of stream characteristics may have unfair and burdensome results. This is true particularly in the case of ephemeral and intermittent streams that have no natural flow during dry weather. In such periods, effluent from the discharger becomes the stream flow.

This situation exists often in mountainous areas in the upper reaches of streams that by their nature are intermittent, and in the arid West where streams may be dry for sometimes large portions of the year.

In cases where the effluent from the discharger becomes most or all of the stream flow, technology-based standards of the act should be controlling. Effluent limitations that require controls beyond BAT should not be imposed except where it is shown on a case-by-case basis that there is a significant environmental benefit. Otherwise, an economic burden may be imposed that is not justified and,

in many cases, is not achievable. As you know, BAT defines the best technology that is economically achievable.

Section 302 of the Clean Water Act authorizes EPA to establish effluent limitations, based on water quality, that are more stringent than the technology-based limitations required under section 301. Before imposing these more stringent limitations, however, EPA must consider the economic and social costs of achieving them. They cannot be imposed if there is no reasonable relationship between the economic and social costs and the benefits to be obtained.

While such considerations of economic and social costs are eminently reasonable, the value of this provision is limited because it applies only to EPA-imposed water quality-based effluent limitations. AMC urges that this provision be extended to State-imposed water quality-based effluent limitations such that economic and social costs and impacts may be considered during permit proceedings.

The term for NPDES permits should be extended to at least 10 years. Such a change will provide certainty for planning and ease the administrative burden upon industry and government, but would not diminish protection to the environment. The bill approved by the Senate Environment and Public Works Committee and pending Senate floor action contains such a provision and we would urge this committee to adopt a similar provision.

At many mining sites, storm water runoff, which once flowed across disturbed areas and became contaminated, is now diverted away from contamination by conveyances and structures built by the operator. These structures prevent or minimize storm water runoff contamination resulting from contact with active operating areas.

The structures and conveyances built to divert such run-off should be excluded from the act's definition of point source and thus not be subject to discharge permits. To do otherwise penalizes operators for using good management practices and making expenditures to prevent storm water runoff contamination. The construction of such diversion facilities is a preventive, often voluntary measure that does not warrant an NPDES permit.

Here again S. 431, as approved by the Senate Environment and Public Works Committee, contains a provision exempting such diversion structures associated with mining, and oil and gas operations from the permitting process. AMC strongly urges this committee to adopt an equivalent provision.

Mr. Chairman, this concludes my statement. I will attempt to answer any questions you may have concerning the matters I have discussed.

Mr. ROE. Thank you very much for your statement, Mr. Beach. Do any of the members have any questions?

[No response.]

Mr. ROE. You are getting off very easily. We thank you for being here with us this morning and we will consider your recommendations.

Mr. CLINGER. Mr. Chairman, I was going to ask unanimous consent if we might submit some questions to Mr. Beach for the record.

Mr. ROE. Fine, no objection.

They will submit some written questions to you for your review if you will be kind enough to respond.

[The questions to Mr. Beach and responses follow:]

The Honorable Arlan Stangeland
U.S. House of Representatives
Washington D.C. 20515

Dear Congressman:

On October 20, 1983, Buddy A. Beach testified on behalf of the American Mining Congress (AMC) before the House Water Resources Subcommittee concerning amendments to the Federal Water Pollution Control Act. Subsequently, you sent Mr. Beach a number of questions in writing to be answered for the hearing record. Below is a restatement of each question followed by AMC's response.

Question: Mr. Beach, on page 2 of your statement, you indicate that "it will be at least 1984 before Phases 1 and 2 of the regulations for nonferrous smelters and refineries will be promulgated." Does this reflect, as I believe it does, a new delay in terms of EPA's currently planned promulgation schedule? I was under the impression that the agency intended to have these regulations promulgated by July 1, 1984.

Response: EPA's most recent Regulatory Agenda indicates that Effluent Guidelines for Nonferrous Metals Manufacturing (Phase I) should have been promulgated by the end of January 1984. 48 Federal Register 47864, 47884 (October 17, 1983). The guidelines for Phase II are scheduled for proposal in February 1984 and for promulgation in November 1984. Id. at 47886.

As of this date, neither the Phase I nor II regulations have been published. EPA has indicated to us that it expects the Phase I final regulations to be signed and sent to the Federal Register by February 17, 1984.

The schedule for EPA's proposal and promulgation of these regulations is governed by a consent decree under the jurisdiction of the U.S. District Court for the District of Columbia. On August 2, 1983, the court issued an order revising the consent decree to allow the

Continued . . .

rulemaking schedule that contains the above-stated dates for Phase I and II rules. NRDC v. Ruckelshaus, Nos. 2153-73 et al. (D.D.C., August 2, 1983) (order revising consent decree).

The previous court-approved schedule indicated that Phase II rules would be proposed in September 1983 and promulgated in June 1984. See NRDC v. Gorsuch, Nos. 2153-73 et al. (D.D.C., October 25, 1982) (order revising consent decree).

Question: On the bottom of page 2 of your statement, you suggest that EPA's policy of "presumptive applicability" led states to set unrealistically high use classifications for various streams. Would you expand on this statement a little more for us? How and when was the concept of presumptive applicability developed? To what extent were state standards established on the basis of this concept? Why did the agency revoke the presumptive applicability policy? The committee would be most interested in any analysis that you might have or could make available, providing as many specific examples as possible which illustrate the problem you are calling to our attention.

Response: The response to this question has been prepared on AMC's behalf by Richard O. Austermann, an attorney with Climax Molybdenum Company in Denver. Due to the length of the response, it is attached as an appendix to this letter.

Question: On page 3 of your statement, you recommend that ephemeral and intermittant streams be exempted from water quality standards. If this policy recommendation were to be accepted, how should ephemeral and intermittant streams be defined?

Response: Intermittant and ephemeral streams have well-known meanings in scientific literature, as illustrated by the following:

> Stream channels that carry water part of the year and are dry the other part, but which receive flow from the groundwater table when it is high enough, are called intermittant. [Morisawa, Marie, Streams: Their Dynamics and Morphology (New York: McGraw-Hill, 1968), p. 11.]
>
> Ephemeral streams are streams or portions of streams that flow only in direct response to precipitation. They receive little or no water from springs and no long-continued supply from melting snow or other sources. The stream's channel is at all times above the water table. [American Geological Institute, Dictionary of Geological Terms (Garden City, N.Y.: Dolphin Books, 1962), pp. 162-3.]

Question: On page 5 of your statement, you indicate support for a provision in S. 431 which extends NPDES permit life from five years to a maximum of ten years. If I am not mistaken, the

Senate provision is rather tightly drawn to (1) require that the permit be reopened and modified under a number of listed conditions and (2) apply only to permits which do not include a waiver or modification of any otherwise applicable requirement under the act. Some concern has been raised that these restrictions may be overly burdensome. Are you satisfied that the provision as drawn is implementable and beneficial?

Response: AMC has concerns that the provision in S. 431 is too tightly drawn. Specifically, we are concerned with that portion of the provision requiring modification of a permit

> . . . whenever new or revised requirements under Sections 301, 302, 303, 304, 307, 403 or 405 are established which are more stringent than any requirement in the permit or which control pollutants not limited in the permit and such modification implements these new or revised requirements.

This provision would significantly revise the permit modification and reopener provisions of existing law.

EPA existing modification provisions are set forth in 40 C.F.R. §122.62 (48 Federal Register 14146, 14174; April 1, 1983). Under these regulations, reopening and modifying a permit is a discretionary responsibility of the permit-issuing authority. The only mandatory modification requirement is set forth in §122.44, which would require the automatic incorporation of more stringent limitations promulgated under Sections 301(b)(2)(C) and (D), 304(b)(2), and 307(a)(2).

The Senate bill provision would destroy this flexibility and discretion, making the process mandatory over a broader range of circumstances. The provision will result in increased administrative burdens for both the permit issuer and the permittee and will greatly decrease the certainty associated with the holding of an approved NPDES permit.

AMC believes that the carefully crafted modification procedures outlined in EPA's existing regulations are workable, practicable and not in need of the wholesale revision that is specified in the Senate bill. We urge the subcommittee to adopt a provision that extends the fixed term of NPDES permits but allows EPA's existing regulatory provisions regarding modification, revocation and termination of such permits to remain in place.

Question: On page 5 of your statement, you suggest that structures and conveyances built to divert stormwater-runoff should be excluded from the act's definition of "point source." How are such conveyances and structures currently permitted? Could they be handled appropriately by issue of general permits?

Response: It appears that there is no consistent policy among the EPA regions regarding the permitting of stormwater diversion structures at mining operations. Technically such structures do fall within the definition of "point source," and in some instances permits have been required (see e.g. "Statement of the Western Regional Council before the Subcommittee on Water Resources, House Committee on Public Works and Transportation," September 20, 1983, p. 3). It appears that such diversion structures could be administratively addressed by issuance of general permits. While the structures may differ in their construction, their general effects would be similar, that is they would be diverting natural stormwater runoff that has not come in contact with previously mined or disturbed areas.

The Senate provision specifically removes from the exemption runoff contaminated by "toxic pollutants." This limitation effectively vitiates the effectiveness of the amendment. Stormwater runoff from undisturbed areas surrounding mining sites may contain some low levels of minerals due to the naturally mineralized areas over which the water flows. AMC does not believe that the mining company that builds a diversion structure should be required to treat such stormwater to remove background levels of inorganics that appear on the Section 307 toxic pollutants list. We suggest that individual permit-issuing authorities be given discretion to address this issue on a case-by-case basis or that a general permit be promulgated that authorizes the discharge of stormwater runoff containing only background levels of contaminants.

Question: The committee has received a number of comments concerning how the requirements of Section 404 of the act might be improved. Are you satisfied with the current provisions of Section 404 and how they are being implemented? If not, would you please provide the committee with your suggestions for making Section 404's dredge and fill permit program more workable and effective?

Response: The dredge and fill permit program in Section 404 is one of the most controversial aspects of the Clean Water Act. Much of AMC's concern for this section arises from its overly expansive scope and its ambiguous and complicated multiagency administration.

The jurisdictional scope of the permit program should be limited. The program should be designed to protect only those wetlands truly in need of protection. Not all wetlands are of the same value and not all merit high priority protection. As it is currently written and administered, the act does not recognize this variability in wetlands' values.

Also, Section 404(c) should be amended to provide that only the Corps of Engineers has the authority over the issuance and supervision of Section 404 dredge and fill permits. At the very least, the role of the Corps should be strengthened

vis-a-vis other agencies. Joint jurisdiction is unnecessary and only adds to uncertainty, time delays and costs of administering the Section 404 permit program.

Congress should clarify whether the section's (b)(1) guidelines are mandatory or discretionary.

The act should be amended to reduce impediments to state administration of the permit program. The existing legislative and regulatory provisions are so cumbersome that no states have been willing to accept primacy for the program.

Question: To what extent do you believe the act's current provisions relating to the fishable-swimmable goal of the act should remain unchanged? Would you please explain the reasons for your position?

Response: AMC is not advocating at this time that the fishable-swimmable goal of the act be modifed.

Hopefully, these responses will be helpful to the subcommittee. If you have any questions, please call me at (202)861-2878.

Sincerely,

Douglas E. McAllister

Douglas E. McAllister
Assistant Chief Counsel

APPENDIX A

EPA'S DOCTRINE OF "PRESUMPTIVE APPLICABILITY" AND OTHER RELATED CONSTRAINTS UPON THE STATES' ADOPTION OF WATER QUALITY STANDARDS

1. Nature of the Problem. EPA's "presumptive applicability" doctrine, and the effect this doctrine has had on the development of state water quality standards, is only one example of a somewhat broader problem relating to the process by which water quality standards are adopted and implemented under the Clean Water Act. In order to describe the impact of "presumptive applicability" in a meaningful way, I will have to place it in the context of the broader problem.

Ever since Congress enacted the Water Quality Act of 1965. the state and federal governments have been engaged in an ongoing effort to adopt and implement mutually acceptable water quality standards. Prior to 1973, these standards were limited in their effect to "interstate" waters. Beginning in 1973, standards have been required for all "navigable" waters.

From the very beginning of this effort, the federal government has put pressure on states to adopt ambitious water quality goals. This pressure has assumed at least three forms:

i. Requirements as to what kinds of uses states must include in their standards;

ii. Restrictions on changes to these uses; and

iii. Restrictions on the states' ability to "tailor" numeric water quality criteria to local needs and conditions.

These restrictions are sometimes distinguished from one another for the purpose of analysis. However, in practice, they always operate together; you cannot tamper with any one without affecting the others.

The doctrine of "presumptive applicability" was one ill-fated manifestation of the third form of restriction. Although this policy has been "revoked" by EPA, some of its elements continue to exist, albeit in altered form. Furthermore, its effects linger on in the form of unreasonably stringent water quality criteria which sometimes cannot be modified because of restrictions on "downgrading" or other "degradation" (which are examples of the second form of restriction). The purpose of this paper will be to describe how and why this occurred, why it is not good policy, and how the process might be improved.

2. Development of Federal Policy on Water Quality.

A. The Formative Period, 1965-1972 -- Prevention of Degradation. Section 5(a) of the Water Quality Act of 1965 amended Section 10(c) of the Federal Water Pollution Control Act to require states to adopt water quality standards for "interstate" waters sufficient to "protect the public health or welfare, enhance the quality of water and serve the purposes of this Act." The purpose of the Act was "to enhance the quality and value of our water resources and to establish a national policy for the prevention, control, and abatement of water pollution."

The Interior Department, which administered the Act at that time through the Federal Water Pollution Control Administration, never adopted any formal policy or regulation to define what it might take to "serve the purpose of the Act." However, it did informally adopt the following "policy guidelines":

> 1. Water quality standards should be designed to 'enhance the quality of water'. If it is impossible to provide for prompt improvement in water quality at the time initial standards are set, the standards should be designed to prevent any increase in pollution. In no case will standards providing for less than existing water quality be acceptable.
>
> * * *
>
> 3. Water quality criteria should be applied to the stream or other receiving water or portions thereof . . . In the absence of appropriate numerical values or biological parameters, criteria should consist of verbal descriptions in sufficient detail as to show clearly the quality of water intended . . .
>
> * * *
>
> 5. Water quality criteria should be accompanied by a description of present water quality and uses, together with uses expected in the future and the water quality required to make those uses possible. The water quality standards proposed by a state should provide for:

(a) Potential and future uses as well as the present intended use and uses;

(b) The upgrading and enhancement of water quality and the use or uses of streams or portions thereof that are presently affected by pollution;

(c) The maintenance and protection of quality and use or uses of water now of a high quality or of a quality suitable for present and potential future uses.

* * *

8. No standard will be approved which allows any waste amendable to treatment or control to be discharged into any interstate water without treatment or control regardless of the water quality criteria and water use or uses adopted. . .

Hearings on Water Pollution Before the House Committee on Public Works, 90th Cong., 1st Sess. 86-88 (1976); Hearings Before the Subcommittee on Air and Water Pollution of the Senate Committee on Public Works, 90th Cong., 2nd Sess. (March 27, 1968). Soon thereafter, the Department published its first set of water quality criteria. Water Quality Criteria -- Report of the National Technical Advisory Committee to the Secretary of the Interior (April 1, 1968) (now referred to as "the Green Book").

Although guideline 1 would seem to have established an absolute non-degradation requirement, the policy does not appear to have been interpreted in this way. In a press release dated February 8, 1968, Secretary Udall stated that:

> Waters whose existing quality is better than the established standards as of the date on which such standards become effective will be maintained at their existing high quality. These and other waters of a state will not be lowered in quality unless and until it has been affirmatively demonstrated to the state water pollution control agency and the

> Department of the Interior that such change is justifiable as a result of necessary economic or social development and will not interfere with or become injurious to any assigned uses. . . . (emphasis added)

In these statements we can see the beginning of several policies that have continued in effect to the present:

i) States were encouraged to "upgrade" their water. However, no specified uses or levels of quality were identified as minimum acceptable goals.

ii) Existing uses were to be protected.

iii) Existing "high quality" waters were to be protected, although degradation in quality would be allowed for "necessary" development.

These guidelines were adopted with little or no public discussion. Although they were controversial, they were not the focus of much attention in the debate preceding adoption of the 1972 amendments. In this debate, attention was primarily directed toward problems created by the absence of effective enforcement mechanisms to implement water quality plans. In response to this problem the 1972 amendments created the NPDES permit program and a two-stage process for meeting the goals of the Act. The first stage consisted of the development and implementation of technology-based effluent limitation guidelines representing secondary treatment and BPT. The second stage consisted of the development and implementation of technology-based effluent limitations representing BAT. Both of these tasks were entrusted almost entirely to EPA.

The 1972 amendments retained requirements for "going beyond BAT", if necessary to protect water quality standards. However, little thought was given to this requirement. Indeed, most of the controversy related to the question of whether BAT was affordable. In this regard, considerable concern was expressed over the fact that Congress was establishing ambitious goals without knowing the cost of attaining them. This criticism was defused by assurances that the process for adopting standards was flexible enough to allow for meaningful consideration of economic impacts.

While the development of technology-based effluent guidelines was left almost entirely to EPA, the 1972 amendments designed the process of "going beyond BAT" as a joint enterprise between EPA and the states. This division of authority was the result of a compromise between the House and Senate. S. 2770 generally called for a strong federal role via the imposition and enforcement of strict deadlines for attainment of the Act's goals. H.R. 11896 gave the states more flexibility.

As finally enacted, the 1972 amendments contained four sections which relate to the process of going beyond BAT: Section 101 sets forth the goals of the Act; Section 303 requires states to adopt water quality standards, and to adopt a statewide "continuing planning process"; Section 208 requires states and local agencies to adopt "areawide" waste treatment management plans, i.e., plans to implement water quality goals established pursuant to Section 303; and Section 302 gives EPA residual authority to impose effluent limitations that are better than BAT, if necessary to meet the goals of the Act (not applicable standards).

B. Post-1972 Development of Federal Policy Regarding Use Restrictions -- "Fishable, Swimmable" Waters as the Norm. For the first several years after adoption of the 1972 amendments, EPA directed most of its energy toward the development of technology-based effluent limitation guidelines. Little attention was paid to the problem of water quality standards, or going beyond BAT. In 1973 and 1974 the agency did adopt interim regulations governing "statewide" continuing planning processes and "areawide" waste treatment management programs. See 38 Fed. Reg. 8034-8039 (March 27, 1973); 38 Fed. Reg. 13567-13571 (May 23, 1973); 38 Fed. Reg. 14230-14232 (May 30, 1973); 38 Fed. Reg. 25681-25683 (September 14, 1973); 39 Fed. Reg. 17202-17206 (May 13, 1974); 39 Fed. Reg. 19634-19639 (June 3, 1974). However, these rules were primarily procedural in character. They did little to prescribe substantive requirements:

> Recommendations for revisions of standards shall consider the objectives of the Act, as specified in § 101(a) of the Act, and the social, economic and technical, including natural, considerations for achieving these objectives.

Former 40 CFR § 131.308(b), adopted at 39 Fed. Reg. 19642 (June 3, 1974) (emphasis added).

In its final regulations relating to areawide waste treatment management plans, EPA did not require the states, as planning agencies for "nondesignated" areas, to prepare detailed treatment plans meeting the requirements of § 208(b)(2) (F through K). See former 40 CFR § 126.20, adopted at 38 Fed. Reg. 25683 (September 14, 1973). This appears to have been done by the agency in an attempt to reconcile apparently conflicting requirements of § 208 and § 303. However, NRDC and EDF challenged this decision, and in the case of NRDC v. Train, 396 F. Supp. 1386 (D.D.C. 1975), the court held that EPA's action was illegal.

Shortly after this decision, EPA proposed amendments to 40 CFR Parts 130 and 131. In part, these proposals responsed to NRDC v. Train by beginning the integration of the § 208 and § 303 planning processes. In addition, they rearticulated an antidegration policy for the first time since adoption of the 1972 amendments. They also indicated that a more aggressive policy regarding water quality standards would soon be developed by the agency:

> The primary objective of the State water quality management plans will be to achieve the 1983 national water quality goal of the Act, where attainable. The plans will . . . . identify necessary revisions to water quality standards. . . .
>
> * * *
>
> EPA will prepare guidelines concerning the development of State water quality management plans to assist the States in carrying out the provisions of these regulations. In addition, EPA anticipates proposing, toward the end of calendar year 1975, regulations governing the review and revision of water quality standards under § 303(c) of the Act and the determination of water quality related effluent limitations under § 302 of the Act. These regulations, therefore, will address the relationship between the social and economic considerations required in § 302 of the Act and the attainability of the national water quality goal expressed in § 101(a)(2) of the Act.

40 Fed. Reg. 29887 (July 16, 1975).

On November 28, 1975, after little or no public debate, EPA issued final regulations which completed the integration of the § 208 and § 303 planning processes, and which fully articulated the agency's policy on water quality standards. In these regulations EPA clearly indicated that it considered the § 101 goals to be mandates, and that the agency intended to take a dominant role in the process of going beyond BAT. The only power to be reserved to the states was flexibility to determine how the goals of the Act should be met:

> The final regulations reflect the primary role of the states in coordinating planning on a statewide basis, consistent with Judge Smith's court order . . . .
>
> * * *
>
> State and areawide planning agencies have been concerned throughout the development of these regulations that EPA has not adequately addressed the issue of revisions to water quality standards and development of a statewide policy on anti-degradation. These regulations set forth clearly EPA's policy regarding the role of water quality standards in achieving the goals of the Act and the agency's anti-degradation position.
>
> EPA strongly supports the establishment of water quality standards which will support the protection and propagation of fish, shellfish and wildlife and recreation in and on the water. In furtherance of this objective, EPA believes that water quality standards should be established at levels consistent with the national water quality goal of § 101(a)(2) of the Act for every stream segment wherever those levels are attainable . . . . While standards at these levels may not be attainable now for some stream segments, EPA expects the state to continue to review their standards and upgrade them to the national water quality goal whenever such standards become attainable.

> EPA Regional Administrators will review the actions of the States regarding these revisons and will, when appropriate, request additional information from the States to evaluate the basis for establishing standards at levels less stringent then the national water quality goal.
>
> These regulations further provide that existing water quality uses shall be maintained, and where existing water quality standards do not specify and protect the existing use, that the state shall upgrade its standards to achieve such specification and protection of these uses. These regulations also provide that designated uses in existing water quality standards shall be maintained and that the existing standards shall not be downgraded to designate and protect less restrictive uses unless one or more of the criteria listed in § 130.17(c)(3) are met.
>
> It should also be emphasized that in addition to the water quality standards established by the states, EPA's commitment to achieving the national water quality goal will also be implemented through the application of § 302 of the Act. . . . EPA is convinced . . . that the adoption of stringent water quality standards, supplemented with appropriate use of § 302 limitations will make the achievement of the national water quality goal a reasonable prospect.
>
> The agency's anti-degradation policy is the same in many respects as the policy that EPA and its predecessor agency have encouraged the states to adopt in the past.

40 Fed. Reg. 55335-55336 (November 28, 1975) (emphasis added).

These final regulations were immediately challenged. However, in the case of Commonwealth Edison v. Train, 649 F.2d 481 (7th Cir. 1980), the court held that they were not ripe for review.

On July 10, 1978 EPA restated this policy, and gave notice that it was considering the adoption of further restrictions on the states' ability to "downgrade" use classifications. See 43 Fed. Reg. 29588-25292 (July 10, 1978). During the next several years draft copies of a new regulation were circulated to the public, but nothing was ever formally proposed.

The next formal proposal occurred on October 29, 1982. 47 Fed. Reg. 49234-49252. In this proposal EPA attempted to address some of the issues raised in the Commonwealth Edison case. However, the final regulations, which were issued on November 8, 1983, essentially revert to the old policy. See 48 Fed. Reg. 51400-51413.

C. Post-1972 Development of Federal Policy Regarding Criteria -- What are "Fishable, Swimmable" Waters? As noted above, the first federal water quality criteria were issued in 1968 by the Federal Water Pollution Control Administration pursuant to the Water Quality Act of 1965. This "Green Book" was intended as guidance only, to be used by state agencies in conjunction with their knowledge of local conditions.

In 1973, soon after responsibility was transferred to EPA, the agency published a draft revision to the Green Book. See 38 Fed. Reg. 29646-29647 (October 26, 1973). This document is now referred to as "the Blue Book". In the notice announcing the availability of this document, the agency stated that:

> The proposed criteria prescribe maximum limits of acceptability for constituents in the nations's waters. . . .
>
> * * *
>
> The new criteria now being proposed will be the basis for future revisions of state standards.
>
> * * *
>
> The EPA criteria for harmful constituents . . . . prescribe specific maximum acceptable limits. . . .

38 Fed. Reg. 29646 (October 26, 1973) (emphasis added).

On August 6, 1976 EPA published its final version of the new criteria document. Quality Criteria for Water, EPA (July 1976); see 41 Fed. Reg. 32947-32948. This document is now referred to as "the Red Book". In the transmittal letter for the Red Book, Eckardt Beck noted that "[w]ater quality criteria do not have direct regulatory use." However, Administrator Train, in his Foreword, noted that "[g]uidelines to implement the consideration of criteria . . . in the development of water quality standards . . . are being developed. . . ."

On July 10, 1978 the agency formally announced these guidelines. They assumed the form of the doctrine of "presumptive applicability":

> The numerical limits in the Red Book are derived on a national scale and generally do not take into account the variability of waters from State-to-State. EPA therefore does not require that States automatically adopt the Red Book numbers for all of their waters.
>
> Nevertheless, EPA feels that the data base for the Red Book numbers is sufficiently broad for the numbers to have presumptive applicability. EPA's policy is that a State may adopt a numerical concentration level for a Red Book pollutant that is less stringent than the Red Book number, but only if a State provides adequate technical justification for the deviation.
>
> * * *
>
> Some unpolluted waters in the nation may exceed designated criteria for particular consituents. There is variability in the natural quality of water and certain organisms become adapted to that quality, which may be considered extreme in other areas. Thus, for those particular waters EPA can accept less stringent numerical criteria than those in "Quality Criteria for Water" when a State can justify such action because of natural background water quality . . . . Criteria for manmade or man-induced pollutants must be compatible with those found in the "Quality Criteria for Water".

43 Fed. Reg. 29588, at 29590, 29592 (July 10, 1978) (emphasis added).

In lawsuits first filed in 1973 and 1975, several environmental groups challenged EPA for its failure to adopt a viable program for the control of toxic pollutants under § 307 of the Act. In a settlement agreement entered into on June 7, 1976 the agency agreed to adopt such a program. See NRDC v. Train, 8 ERC 2120 (D.D.C. 1976). However, the settlement went far beyond § 307. In particular, in paragraph 11 of the consent agreement, EPA agreed to adopt new water quality criteria for 65 specified "toxic" pollutants.

On May 18, 1978 EPA published technical guidelines it planned to use in developing these criteria. 43 Fed. Reg. 21506-21518. A review of these guidelines, and subsequent elaborations thereof, makes it clear that the criteria are designed to provide an extremely high degree of protection for uses, even when protection of public health is not involved. In effect, EPA is giving precise meaning to the "fishable, swimmable" standard. For instance, in evaluating toxicity data for the protection of aquatic life, EPA elected to discard all data from tests in which test organisms had previously been exposed to "significant concentrations" of test material. See 44 Fed. Reg. 15971 (March 15, 1979). Thus, the criteria do not take into account the tolerances that aquatic species develop to real-world concentrations of pollutants.

The criteria also include substantial "margins of safety". For instance, to derive criteria for acute toxicity to aquatic life, the agency first calculated the geometric mean of "standardized" 96-hour LC50s -- that is, concentrations of pollutants that will kill one-half of a standardized test population in 96 hours. These figures were then multiplied by a "sensitivity factor" of 0.2564 to derive the criteria. See 43 Fed. Reg. 21507. To derive criteria to protect against chronic toxicity to aquatic life, the agency first calculated the geometric mean of "standardized" MATCs -- that is, maximum acceptable toxicant concentrations. These represent the highest concentrations of pollutants that will have no measurable adverse effect on survival, growth, or reproduction of a species. The average MATCs were then multiplied by a "sensitivity factor" of 0.149 to derive the criteria. See 43 Fed. Reg. 21507 (May 18, 1978).

As a result of these statistical manipulations, criteria for the protection of aquatic life are set at a level which will, on average, protect 98% of exposed test populations. As EPA has stated:

> The criteria for the protection of aquatic life specify pollutant concentrations which, if not exceeded, should protect most, but not all, aquatic life and its uses.

45 Fed. Reg. 79321 (emphasis added). See also "The Philosophy of Quality Criteria" in the Red Book. In most cases, these aquatic life criteria are the limiting factors for the protection of water quality, i.e., no other criteria are more stringent.

Water quality criteria for the 65 specified "toxic" pollutants were proposed on March 15, July 25, and October 1, 1979. 44 Fed. Reg. 15926-15981, 43660-43697, and 56628-56657. Final criteria for all but one of these pollutants were published on November 28, 1980. 45 Fed. Reg. 79318-79379. They supercede Red Book criteria in the event of conflict. Otherwise, Red Book criteria remain in effect.

In the preamble to the final "toxics" criteria, EPA formally rescinded its doctrine of "presumptive applicability":

> In the ANPRM, EPA announced a policy of "presumptive applicability" for § 304(a)(1) criteria codified in the "Red Book" . . . . EPA is rescinding the policy of presumptive applicability because it has proven to be too inflexible in actual practice.
>
> . . . . In certain circumstances, the criteria may not accurately reflect the toxicity of a pollutant because of the effect of local water quality characteristics or varying sensitivities of local populations. For example, in some cases, ecosystem adaptation may enable a viable, balanced aquatic population to exist in waters with high natural background levels of certain pollutants. Similarly, certain compounds may be more or less toxic in some waters because of differences in alkalinity, temperature, hardness, and other factors.

45 Fed. Reg. 79319-79320 (November 28, 1980).

This rescission is as significant for what it said as for what it did not say. First, the agency did not substitute a clear-cut standard of review for the old standard. Thus, in the event of disagreement between a state and EPA, it is unclear what the state must do to obtain approval of its water quality standard. Second, the agency suggested that criteria may not be relaxed when aquatic organisms have become tolerant of manmade pollution. Instead, to justify the relaxation of criteria, tolerance must be based on a response to natural pollutants. Third, the agency did not indicate that states may provide a lesser degree of protection to aquatic life, and still have a "fishable, swimmable" stream within the meaning of Section 101.

In the case of Mississippi v. Costle, 625 F. 2d 1269 (5th Cir. 1980), the Fifth Circuit held that EPA is free to substitute its own criteria for those adopted by a state, if necessary to protect state-designated uses.

D. Summary of Current Policy. Due to the length of the preceding discussion, before proceeding further it will be useful to summarize EPA's current restrictions on state modification of water quality standards:

A. As to use classifications --

i. "Fishable, swimmable" use designations are deemed to be the norm. All stream segments must carry all use classifications identified in § 101(a) of the Act unless they are "unattainable".

ii. Uses are "unattainable" only if one or more of the following criteria are met: the use cannot be met due to natural conditions; the use cannot be met due to irremedial man-induced conditions; or attainment of the use would result in substantial and widespread economic and social impact.

iii. "Existing" uses may never be downgraded. Nor may they be "subcategorized" to provide a lower degree of protection to the use.

iv. "Designated" but "non-existing" uses may be downgraded, but only if the designated use is "non-attainable", as described above.

B. As to numeric criteria or standards --

i. "High quality" waters may be degraded to criteria levels necessary to protect all designated uses, but only if such degradation is necessary to accommodate important economic or social development.

ii. To protect designated uses, EPA criteria adopted under § 304(a)(1) of the Act are the norm. States bear the burden of proving that any deviation from this norm is "appropriate".

iii. For a deviation to be "appropriate", it appears that the toxicity of the relevant parameter must be reduced by local natural conditions or acclimation to such conditions.

iv. Alternate criteria must provide the same degree of protection for uses as EPA criteria.

3. Effect of EPA Policy on State Action. In my experience, the foregoing federal policies have had a profound impact on state action. As an example I will use Colorado, the state with which I am most familiar.

A. The Formative Period, 1965-1972 -- Prevention of Degradation. As noted above, the federal Water Quality Act of 1965 was adopted on October 2, 1965. 79 Stat. 903. In response to this, on March 9, 1966, the Colorado legislature adopted the Colorado Water Pollution Control Act of 1966. L. 66, pp. 199-209, C.R.S. 1963 § 66-28-1 et seq. (1967 Perm. Cum. Supp.). Section 8 of this Act specifically authorized the State Water Pollution Control Commission to adopt water quality standards necessary to comply with the federal act.

On August 15, 1966 the commission notified Secretary Udall of its intent to adopt such standards. The first set of standards were proposed on December 21, 1966, and finally adopted on January 25, 1967.

These regulations assumed the following form:

i) The commission adopted narrative "Basic Standards" that were applicable to all waters of the state. These standards

included the requirement that all waters be free from "toxic, or other deleterious substances attributable to municipal, domestic, industrial wastes, or other controllable sources in levels or concentrations or combinations sufficient to be harmful to human or animal life."

ii) The commission adopted the following system of use classifications:

A. Public Water Supply

B. Recreational Waters
   1. Fish and Wildlife
   2. Body Contact Sports

C. Industrial Water Supply

D. Agricultural Water Supply
   1. Irrigation Water
   2. Livestock Watering

iii) The commission adopted a limited set of supplemental numeric criteria for each use classification that would automatically apply as standards to each interstate stream segment receiving that classification. In other words, they were "presumptively applicable".

Subsequent to the adoption of these standards, the commission held classification hearings for each of the four major river basins in the state. Classifications were not applied to all waters, but only to the mainstems of the interstate rivers and their major tributaries. For instance, the Arkansas River basin was divided into six "sections" or segments, each of which consisted of the mainstem of the river and named tributaries. An A.1 "public water supply" classification was adopted for five of the six segments, B.1 for all six segments, C for two segments, D.1 for all six segments, and D.2 for five of the six segments.

On October 21, 1968 Secretary Udall "approved" these standards with several exceptions. The most important exception was the state's failure to adopt an anti-degradation provision.

In response to Secretary Udall's action, the state amended its Basic Standards to include an anti-degration standard for "high quality" waters. These amended standards were approved by EPA Administrator Ruckelshaus on March 4, 1971.

B. Post-1972 Developments Regarding Use Restrictions -- "Fishable, Swimmable" Waters as the Norm. On April 13, 1971 the commission adopted revised water quality standards and stream classifications for the entire state. The Basic Standards did not change much: the "B" classification for "Recreational Waters" was refined to distinguish between warm water and cold water fisheries; and additional numeric criteria were adopted for classified uses. The classification system, on the other hand, was considerably refined and expanded. The state was now divided into ten basins and subbasins, and use classifications were applied to all waters within each basin. In addition, segmentation was increased. For instance, in the Arkansas River Basin, the previous six segments were replaced by twenty- three new segments. Of these, an "A" Public Drinking Water Supply classification was applied to ten segments, "B_1" Cold Water Fishery to eleven segments, "B_2" Warm Water Fishery to two segments, "C" Industrial Water Supply to ten segments, and "D_1" Irrigation to all twenty-three segments. Six segments lacked any aquatic life classification, and none of the segments were classified for body contact sports.

On January 18, 1973, subsequent to enactment of the Federal Water Pollution Control Act Amendments of 1972, the regional EPA office sent a "critique" of the state's new water quality standards to Governor Love. Attachment 1. This critique consisted of two parts: a list of changes which "[were] to be incorporated into your state's water quality standards by April 18, 1973, for interstate waters, and by June 18, 1973, for intrastate standards. . ."; and a further list of changes that the region "recommended", but which were not subject to federal promulgation in the absence of state action.

As to use classifications, EPA asked Colorado to justify its failure to prescribe "aquatic life" and "contact recreation" classifications for all stream segments.

As to criteria, EPA wanted the state to supplement its statewide narrative standards with certain minimum numeric criteria. In describing these criteria, EPA distinguished between two "classes" of water: Class "A" waters, which it defined as waters to be classified for Primary Contact Recreation; and Class "B" waters, which were defined as waters to be classified for Secondary Contact Recreation and for the protection and propogation of fish, shellfish and wildlife.

EPA's "nonenforceable" recommendations related to the use of mixing zones.

Colorado did not meet the deadlines prescribed in EPA's letter. Nonetheless, on July 6, 1973 the Colorado legislature enacted the Colorado Water Quality Control Act

of 1973, L. 1973, pp. 709-731, C.R.S. 1973 § 25-8-101 et seq. This Act was specifically designed to enable Colorado to meet all requirements of the new federal act, and in November 1973 the renamed Water Quality Control Commission proposed a comprehensive revision to the existing standards and classifications. On January 15, 1974 the commission adopted the new standards, and on March 19, 1974 it adopted the new classifications.

The new regulations were a clear response to EPA's critique:

i) The Basic Standards were modified to conform to EPA's desires, particularly with regard to the protection of aquatic life.

ii) The old classification scheme was discarded. In its place was substituted a new scheme which was clearly based on EPA's "A" and "B" distinction. The new scheme contained only four categories: "A_1", which was to be applied to cold water suitable or to become suitable for all purposes for which raw water is customarily used, including primary contact recreation; "A_2", which was to be applied to warm water suitable or to become suitable for the same purposes; "B_1", which was to be applied to cold water suitable or to become suitable for all purposes for which raw water is customarily ues, except primary contact recreation; and "B_2", which was to be applied to warm waters suitable or to become suitable for the same uses.

iii) The numeric water quality criteria for each classification generally corresponded to EPA's recommendations. They remained "presumptively applicable".

Once again, the state was divided into ten basins. However, due to the simplification of the classification scheme, segmentation was reduced. For instance, the Arkansas River basin was reduced to thirteen segments. Furthermore, each segment had a single classification, A_1, A_2, B_1, or B_2. Thus, each segment was automatically "classified" for all uses mentioned in Section 101(a)(1) of the federal act.

Almost as soon as these new standards and classifications were adopted, it became apparent that they would have to be changed. For one thing, the new use categories failed to provide any meaningful distinction among stream segments. For another, EPA's publication of the Blue Book made it clear that more detailed criteria would be needed. An ad hoc committee to review the regulation was appointed in 1976, and the committee filed a detailed report to the full commission in November 1976. After taking the matter under advisement, the commission proposed a new set of standards on December 1, 1977. After public hearings, these standards were adopted on May 2, 1978.

The new standards were considerably more detailed than before. Once again, they clearly responded to EPA policy.

As to use classifications:

i) The commission adopted the following new set of use classifications:

A. Recreation - Class 1 - Primary Contact

B. Recreation - Class 2 - Secondary Contact

C. Agriculture

D. Warm Water Aquatic Life - Class 1

E. Warm Water Aquatic Life - Class 2

F. Cold Water Aquatic Life - Class 1

G. Cold Water Aquatic Life - Class 2

H. Domestic Water Supply - Uncontaminated

I. Domestic Water Supply - Water Requiring Treatment

J. Existing High Quality Waters - Class 1 - Resource Waters

K. Existing High Quality Waters - Class 2 - Non-resource Waters

L. Special Protection Waters

ii) Streams were to carry the highest use classifications "attainable". Uses were deemed "attainable" if they could be achieved within twenty years utilizing recognized control techniques that were environmentally and socially acceptable.

iii) Existing uses could not be downgraded.

iv) Designated but non-existing uses could be downgraded, but only if the designated uses were "nonattainable", as described above.

As to numeric water quality criteria:

i) The commission adopted a detailed set of tables establishing numeric criteria for each use category. These criteria continued to be "presumptively applicable", i.e., they automatically applied to stream segments carrying the specified classifications unless, after a rule-making hearing, the commission decided that alternative standards were more appropriate. These "table numbers" closely paralleled EPA's Red Book numbers.

ii) Class 1 - High Quality Waters could not be degraded.

iii) Class 2 - High Quality Waters could be degraded, but only if necessary to accommodate important economic or social development.

C. Post-1972 Developments Regarding Criteria -- What are "Fishable, Swimmable" Waters? New stream classification hearings were planned following adoption of these standards. However, there was an immediate outcry against the standards, particularly with regard to the presumptive applicability of table numbers. The standards were challenged, and in response to some of the issues raised in this lawsuit the commission elected to revise the standards before proceeding with the new classification proceedings. An amended regulation was proposed on August 24, 1978, and adopted in final form on May 22, 1979. This regulation differed from the previous regulation in at least two major respects:

i) "Special Protection Waters" were deleted as a use classification.

ii) Table numbers were no longer presumptively applicable. In other words, they were not automatically converted into "standards" upon adoption of use classifications. Instead, standards had to be specifically adopted for each segment, based upon a rulemaking record.

This regulation has been amended several times since 1979, but not in ways that are relevant to this discussion. A copy of the current regulation, now referred to as "The Basic Standards and Methodologies", is attached hereto as Attachment 2.

D. State Reaction Against the Vestiges of "Presumptive Applicability". Upon adoption of these new standards, the commission commenced the process of reclassifying state waters under the new system, and adopting numeric standards necessary to protect those uses. This effort took almost five years, and has just been completed.

Notwithstanding the demise of the "presumptive applicability" doctrine at both the state and federal levels, vestiges of the doctrine and its related policies had a significant impact on the manner in which the commission undertook this reclassification of Colorado's rivers. This influence occurred in at least three ways: in the definition and application of the "Cold Water Aquatic Life - Class 1" use classification; in the treatment of in-stream monitoring data; and in the use of "table numbers" when monitoring data was not available.

(1) Definition and Application of "Cold Water Aquatic Life - Class 1" Use Classification. In Colorado, "Class 1" aquatic life classifications are generally the most restrictive use categories in terms of the criteria they carry. Thus, since classifications "drive" numeric standards, the applicability or nonapplicability of such a classification is generally a central issue in the commission's proceedings .

As noted above, under EPA policy, "fishable" use classifications are deemed to be the "norm", i.e., if states do not include them, they bear the burden of proving that they are unattainable. In Colorado, this federal policy has been implemented in the following manner: a "Class 1" aquatic life use classification is generally deemed

to be appropriate unless the use is shown to be attainable for reasons other than water quality. As I tried to explain in my earlier testimony, this cannot always be done. As a consequence, the commission has adopted "Class 1" use classifications for numerous stream segments that do not support "Class 1" aquatic communities because of water quality limitations. This was often done without explicit recognition that the classification was a goal, and with little or no consideration of whether or not the use was "attainable". This approach has led to a high number of "Class 1" streams. For instance, in the Colordo River Basin, which was the first basin to be reclassified under the new system, of 75 segments receiving classifications, fully 68 of them carried "Aquatic Life Class 1" or "High Quality" classifications.

(2) Treatment of In-Stream Monitoring Data. As noted above, in its computation of water quality criteria EPA discards any data from tests in which test organisms have previously been exposed to pollution. Furthermore, in its revocation of the "presumptive applicability" doctrine, the agency suggested that deviations from its criteria could not be justified on the basis of manmade pollution. In Colorado, this policy was reflected in the state's general policy of refusing to give any effect to in-stream monitoring data that reflected the influence of manmade discharges.

(3) Use of "Table Numbers" in the Absence of Other Data. Even though EPA's water quality criteria are no longer "presumptively applicable", states must still justify any deviation from them. In Colorado, this policy is reflected in the fact that "table numbers" are applied to stream segments when there is no other water quality data available.

E. Legislative Response to the Vestiges of "Presumptive Applicability". As suggested above, the foregoing policies had a severe impact on some dischargers. This occurred in one of two ways. Under the first scenario, the state adopted ambitious water quality goals with little or no recognition of the fact that additional treatment would be required to attain them. Under the second scenario, the state adopted stringent use classifications accompanied by relaxed numeric standards. While this, in itself, might not lead to unreasonable treatment requirements, it placed dischargers at risk under the doctrine of Mississippi v. Costle: EPA might approve the use classification, but impose substantially more stringent numeric criteria.

Partially in response to its dissatisfaction with the foregoing practices, the Colorado legislature totally revised the Colorado Water Quality Control Act in 1981. L. 81, pp. 1310-1339, C.R.S. § 25-8-101 et seq.

(1982 Replacement Volume). In this new law, the legislature required that all of the commission's actions be "economically reasonable". Specifically, in the process of "going beyond BAT", the water quality benefits of pollution control measures must bear "a reasonalbe relationship to the economic, environmental, energy, and public health costs and impacts of such measures. . ." C.R.S. § 25-8-102(5). Pursuant to this requirement, the commission has begun to modify some of its earlier decisions.

EPA's response to this change has been unfortunate -- it has threatened to revoke Colorado's right to administer the NPDES program. This threat is not based upon any conflict between the Colorado statute and the language of the Clean Water Act. Nor is it based upon any allegation that state-issued permits fail to provide adequate protection of water quality. Instead, the threat is based upon a conflict between the Colorado statute and EPA policy. Under EPA policy, all streams must be "fishable and swimmable" in the precise manner defined by EPA unless attainment of such a goal would result in "substantial and widespread economic and social impact". Under state law, a lesser degree of protection may be provided if the water quality benefits bear no reasonable relationship to the costs.

4. Analysis and Resolution of the Problem. The issue here is primarily one of state-federal relations. In our opinion, Colorado's response to EPA's policies has been perfectly reasonable.

Under the Clean Water Act, the task of going beyond BAT to meet the goals of Section 101 was designed as a joint federal-state enterprise, as a "partnership". However, EPA's interpretation of the act has turned this design into a shambles. To the extent that a partnership exists at all it is a limited partnership, with EPA as the general partner making all policy decisions, and with the states as limited partners who do nothing more than contribute money to pay for EPA's programs. This is not good policy. The federal intrusion into local planning matters is too great.

The current situation needs to be changed in at least three ways:

i. The goals of Section 101 should not be given a fixed, inflexible meaning. The states should have greater flexibility to determine the meaning of "fishable, swimmable". They should be free to provide a greater or lesser degree of protection to aquatic life than EPA currently seems to demand, and they should be free to take into account the real-world tolerance to manmade pollution that aquatic life often develops.

ii. The states should have greater flexibility to determine when the goals of Section 101 are not reasonably attainable.

iii. In its review of water quality standards, EPA should bear the burden of proving that the states have failed to "meet the requirements" of the act. In this effort, EPA should not be able to require states to do more than the Administrator could do himself under Section 302.

ENVIRONMENTAL PROTECTION AGENCY
REGION VIII
SUITE 900, 1860 LINCOLN STREET
DENVER, COLORADO 80203

January 18, 1973

RECEIVED
FEB 1 - 1973
WATER POLLUTION
CONTROL DIVISION

Our Ref: 8A

Honorable John A. Love
Governor of Colorado
State Office Building
Denver, Colorado 80202

Dear Governor Love:

The enclosed attachments constitute the results of a review of your State's Water Quality Standards by the Environmental Protection Agency pursuant to Sections 303(a)(1), (2), and (3) of the Federal Water Pollution Control Act Amendments of 1972. The authority to make this notification and to approve or disapprove all suggested changes to water quality standards, including criteria, uses, implementation plans and the anti-degradation statement, has been delegated to me by the Administrator of the Environmental Protection Agency.

Attachment A contains the standards provisions which are to be incorporated into your State's Water Quality Standards by April 18, 1973, for interstate waters, and by June 18, 1973, for intrastate standards. Attachment B sets out changes in standards which we recommend to your State for consideration but which are not subject to Federal promulgation.

In providing these recommendations, we recognize and applaud the outstanding effort which your State has provided in adopting and enforcing water quality standards. This effort has resulted, in some instances, in State standards which are more demanding than minimums stated here, a development which we will continue to encourage.

Under the provisions of the Act, water quality standards are to be established for all interstate and intrastate waters. After adoption by the State and approval by the Environmental Protection Agency, standards will apply to all navigable waters, i.e., all surface waters of the State. It will be necessary for the State Attorney General to indicate to this Office by letter that any State changes in water quality standards were adopted in a manner that satisfies the administrative requirements of State law.

Although we have chosen to incorporate herein comments applying to standards for both interstate and intrastate waters, the applicability of these comments to intrastate waters must not be considered final until March 18, 1973. At that time, we will provide you with a final review letter applying to intrastate waters incorporating public comments which we receive in the interim. Public participation in the development and revision of water quality standards at the State and Federal level is required by Section 101(e) of the Act.

As you are aware, the new Permit Program contained in the 1972 Act will accomplish what the previous implementation plans were designed to accomplish. We are, therefore, not specifying new implementation plan dates, and are not encouraging the State to undertake a major revision of the implementation plans. I am, however, taking this opportunity to point out that each implementation date will undergo a separate case-by-case review that will ultimately result in the issuance of a permit under Section 402 of the Act.

Additionally, I would like to take this opportunity to point out that Section 301(b)(1)(C) of the Federal Water Pollution Control Act Amendments of 1972 provides that water quality standards shall be met not later than July 1, 1977.

We look forward to working closely with your State in achieving the changes in water quality standards necessary to provide for the degree of protection of our Nation's waters mandated by the 1972 Federal Water Pollution Control Act Amendments.

Sincerely yours,

John A. Green
Regional Administrator

ATTACHMENT "A"

PROVISIONS SUBJECT TO PROMULGATION

STATE WATER QUALITY STANDARDS

STATE OF COLORADO

Stream Use Classification

As an initial step in proceeding toward the national goal of water quality which provides for the protection and propagation of fish and wildlife, and provides for recreation in and on the water by 1983 (Section 101(a)(2)), the Environmental Protection Agency has adopted a policy that all waters should currently be protected for the preservation and propagation of desirable species of aquatic life (specified as warm or cold water), and for recreation in or on the water. Additional use classifications for public water supplies, agriculture, industry, and other purposes may be adopted but, except as provided below, the criteria supporting these uses may not be less stringent than the following recreation and aquatic life criteria, nor interfere with recreation and aquatic life uses.

The Environmental Protection Agency recognizes that because naturally occurring poor quality or man-made pollution combined with technological limitations may prohibit improvement of water quality to the degree necessary, some waters may qualify for an excepted classification. No water may be lowered in quality from an existing higher quality because of the previously approved anti-degradation provision. Any exceptions must be supported by data gathered from State and Federal sources, and will be granted only on a case-by-case basis for specific water quality criteria. Exceptions must be carefully scrutinized during the periodic review of standards provided for by Section 303(c) of the Act. If your State desires to except waters from the recreation and aquatic life use classifications, please provide us with the specific supporting data prior to April 18, 1973.

Water Quality Criteria

The minimum criteria necessary to protect various use classifications are those set by the National Technical Advisory Committee in its report to the Secretary of the Interior on Water Quality Criteria, April 1, 1968, and other information provided by the Environmental Protection Agency.

A review of the general water quality criteria applicable to all State waters should be made to insure that as a minimum, the following criteria are adopted. Waters shall be:

(1) Free from substances attributable to municipal, industrial, or other discharges or agricultural practices that will settle to form objectionable sludge deposits.

(2) Free from floating debris, scum, and other floating materials attributable to municipal, industrial, or other discharges or agricultural practices in amounts sufficient to be unsightly or deleterious.

(3) Free from materials attributable to municipal, industrial, or other discharges or agricultural practices producing color, odor, or other conditions in such degree as to create a nuisance or render any undesirable tastes to fish flesh or in any way make fish inedible.

(4) Free from substances attributable to municipal, industrial, or other discharges or agricultural practices in concentrations or combinations which are toxic or harmful to human, animal, plant or aquatic life.

(5) Free from substances and conditions or combinations thereof attributable to municipal, industrial, or other discharges or agricultural practices in concentrations which produce undesirable aquatic life.

(6) Free from residue attributable to wastewater or visible film oil or globules of grease which cause a film or sheen (or be present in concentrations at or in excess of 10 mg/l) upon, or discoloration of the surface or emulsion to be deposited beneath the surface of the water or upon adjoining shorelines or prevent classified uses of such waters.

In order to insure that all waters of your State are protected for (1) primary contact recreation, and/or (2) aquatic life and secondary contact recreation uses, it is a requirement that as a minimum, the following water quality criteria be adopted for all waters of your State. Other values may be adopted for those waters which qualify for an excepted classification.

Class "A" Waters*: Those waters to be classified for primary contact recreation purposes.

Class "B" Waters*: Those waters to be classified for secondary contact recreation and for the protection and propagation of fish, shellfish, and wildlife.

Bacteria

Bacteriological concentrations in Class "A" Waters should not exceed a geometric mean of 200 fecal coliform groups per 100 milliliters or 1000 total coliform groups per 100 milliliters based on a minimum of not less than five samples obtained during separate 24-hour periods for any 30-day period, nor shall 10 percent of the fecal coliform groups exceed 400 groups per 100 milliliters, nor should 20 percent of the total coliform groups exceed 2000 groups per 100 milliliters during any 30-day period.

Bacteriological concentrations in Class "B" Waters should not exceed a geometric mean of 10,000 total coliform groups or 1000 fecal coliform groups per 100 milliliters based on a minimum of not less than five samples obtained during separate 24-hour periods for any 30-day period, nor shall 10 percent of the fecal coliform samples exceed 2000 groups per 100 milliliters during any 30-day period.

Dissolved Oxygen

The dissolved oxygen concentration in Class "A" Waters shall not be less than 5 milligrams per liter.

The dissolved oxygen concentration in Class "B" warm water fisheries shall not be less than 5 milligrams per liter.

---

* The water quality criteria for Classes "A" and "B" Waters are compatible with agricultural, industrial, and navigational uses. In addition, waters designated for public water supplies should meet the revised Environmental Protection Agency Drinking Water Standards.

The dissolved oxygen concentration in Class "B" cold water fisheries shall not be less than 6 milligrams per liter with a minimum of 7 milligrams per liter required during spawning periods.

pH

In Class "A" Waters the pH shall be maintained between 6.5 and 8.3 units.

In Class "B" Waters the pH shall be maintained between 6.0 and 9.0 units.

Temperature

For Class "A" Waters the maximum temperature should not exceed 90 degrees Fahrenheit.

For all Class "B" Waters there should be, based on the minimum expected flow for that month, no more than a 5 degree Fahrenheit change in ambient stream temperature, nor should the maximum incremental temperature exceed 2 degrees Fahrenheit per hour.

For Class "B" warm waters the maximum temperature should not exceed 90 degrees Fahrenheit. There should be no more than a 3 degree Fahrenheit change above ambient temperature in impoundments.

For Class "B" cold waters the maximum temperature should not exceed 58 degrees Fahrenheit except those areas managed for brown trout fisheries where a maximum temperature of 65 degrees Fahrenheit is permitted.

For all Class "B" Waters there shall be no induced temperature change over spawning beds.

Color and Turbidity-Producing Substances

For Class "A" Waters, a secchi disc should be visible to a minimum depth of one meter.

For Class "B" Waters the turbidity in the receiving water should not exceed 50 JTU in warm water streams, or 10 JTU in cold water streams.

20-955 O—84——77

Total Dissolved Gas Pressure

In waters protected as cold water fisheries, discharges from impoundments or other sources shall not cause the total dissolved gas pressure to exceed 110 percent of existing atmospheric pressure.

Radiological Criteria

1. The average dissolved concentrations (including the naturally-occurring or "background" contribution) of Iodine-131, Radium-226, Strontium-89, Strontium-90, and Tritium shall not exceed the following concentration limits:

Iodine-131	5 pCi/l
Radium-226	1 pCi/l
Strontium-89	100 pCi/l
Strontium-90	10 pCi/l
Tritium	3000 pCi/l

For all other radionuclides, the average dissolved concentration limits shall be 1/150 of the corresponding maximum permissible concentration in water for continuous occupational exposure as recommended by the National Committee on Radiation Protection (National Bureau of Standards Handbook 69, or subsequent revisions).

2. For the case of a mixture of radionuclides, the following relationship shall be satisfied:

$$\frac{C_1}{L_1} + \frac{C_2}{L_2} + \ldots + \frac{C_n}{L_n} \leq 1.00$$

Where C denotes the average concentration of the respective radionuclide, and L denotes its concentration limit (Item 1).

3. In cases where alpha emitters, Strontium-90, Radium-228, Iodine-129, Iodine-130, and Lead-210 are known to be absent, routine analyses for dissolved gross beta radioactivity (excluding Potassium-40 contribution) may be employed to monitor and show compliance with this criteria (except for Tritium) so long as the gross concentration does not exceed 100 picocuries per liter. When these conditions are not met, routine quantitative analyses of individual radionuclides shall be performed to show compliance. Except in cases where Tritium from other than natural sources is known to be absent, routine Tritium analyses shall be performed to show compliance. (Note: Absence taken to mean a negligibly small fraction of the specific concentration limit, where the limit for unidentified alpha emitters is taken as the limit for Radium-226.)

4. For radionuclides associated with suspended material in transport, the average concentration limits shall be 1/150 of the corresponding maximum permissible concentration in water (insoluble form) for continuous occupational exposure as recommended by the National Committee on Radiation Protection. Moreover, in-stream sedimentation of these materials shall not produce solids beds such that there is non-compliance with the provisions of Items 1 and 2 (because of leaching) and/or excessive accumulation in native flora and fauna.

5. "Average" concentrations shall be computed from monitoring data acquired during the previous twelve months; however, maximum concentrations shall not exceed three (3) times the average concentration limits specified herein.

6. Variances from concentration limits specified herein shall be permitted only if (a) the contributing source(s) is a non-controllable, natural source; (b) best available treatment is provided for man-made discharges; and (c) the exposure received by affected population groups is within established dose limits.

Salinity

Your State Water Quality Standards should reflect the following policy with respect to Salinity:

1. High salinity (Total Dissolved Solids) is recognized as a significant water quality problem causing adverse physical and economic impacts on water users. Salinity concentrations are affected by two basic processes: (a) salt loading - the addition of mineral salts from various natural and man-made sources, and (b) salt concentrating - the loss of water from the system through consumptive use or depletion.

2. Studies to date have demonstrated that the high salinity of stream systems can be alleviated. Although further study may be required to determine the economic and technical feasibility of controlling specific sources, sufficient information is available to develop a salinity control program. Emphasis will be placed on controlling high salinity through improved water management and conservation practices.

3. The anti-degradation policy will be applied to salinity.

4. The State will determine salinity problem areas within the State and the need for specific numerical standards in terms of quantity and concentration and promulgate such criteria no later than October 18, 1975.

Since salinity is a water quality problem in the Colorado River Basin, ambient numerical standards in terms of quantity and concentration for total dissolved solids (minerals and inorganic chemical constituents) must be established for the Colorado River portion of your State. The levels established should be sufficient to serve the purposes of the Act and meet recommendations of the Colorado River Basin Conference of April 1972.

Miscellaneous Provisions

Tests or analytical procedures should be modified to reflect the following:

1. "All methods of sample collection, preservation, and analyses used in applying any of the rules and regulations in these standards shall be in accord with those prescribed in the current edition of 'Standard Methods for the Examination of Water and Waste Water' or methods prescribed in subsequent Environmental Protection Agency publications.

2. For bioassay tests median tolerance concentrations shall be based on the most recent research results for the materials being studied, or by bioassay tests simulating actual stream conditions in accordance with procedures outlined in the latest edition of 'Standard Methods for the Examination of Water and Waste Water' published by the American Public Health Association, or in accordance with tests or analytical procedures that have been found to be equal or more applicable by the Environmental Protection Agency. Bioassay studies should be made using the most sensitive local species and life stages of economic or ecological importance.

3. When specific application factors are not available, the application factor should be determined by using methods listed in the latest edition of 'Water Quality Criteria' published by the Federal Water Pollution Control Administration (1968), or by using other methods accepted as equal or applicable by the Environmental Protection Agency."

In addition to those items specifically outlined in Attachment A, all other statements, policies, and declarations contained within your State's Water Quality Standards that conflict with the Federal Water Pollution Control Act Amendments of 1972, shall be revised to be consistent with the intent, policies, and goals of the Act.

ATTACHMENT B

RECOMMENDED CHANGES TO

STATE WATER QUALITY STANDARDS

COLORADO

RECOMMENDED CHANGES TO STATE WATER QUALITY STANDARDS

The following comments constitute items which we recommend to the State for inclusion in the State Water Quality Standards. If not adopted, the changes suggested are not subject to promulgation by the Environmental Protection Agency.

It is recommended that efforts be made to develop a fairly comprehensive mixing zone definition. The following definition and criteria are provided for your consideration:

A mixing zone is defined as that volume of water wherein any pollutant may exceed the allowable standards. The following criteria apply:

A. All permissible water discharges to surface water shall be entitled to a mixing zone at the edge of which established receiving water criteria shall be met.

B. The mixing zone should be kept as small as possible and shall not be of a size and shape as to cause or contribute to the impairment of water uses.

C. The mixing zone in streams shall not exceed 25 percent of the surface width or 10 percent of any cross sectional area measured perpendicular to stream flow at the point of discharge.

D. The mixing zone dimensions parallel to stream flow shall not be more than five times the greatest dimension perpendicular to stream flow.

E. The mixing zone should not: (1) be located in or extend into spawning, nursery, or rearing areas of fin fish or shellfish; (2) be so situated as to block or in any way interfere with the migration of fin fish or impede the movement of any motile organisms; (3) be located in or extend into public bathing waters or waters which are a part of public parks, preserved in their natural state or for primary contact water recreation use; (4) be located in or extend into the near-vicinity of public or industrial water supply intakes; (5) be located in such a manner which would permit other significant impairments of water use or adverse effects to aquatic life.

F. The mixing zones in lakes, impoundments, and bays shall not exceed 25 percent of the surface areas or 10 percent of the volume measured from the shoreline to the 30-foot depth line between any two parallel lines perpendicular to the shoreline trend. In such bodies of water where the average depth is less than 30 feet, the mixing zone shall be defined by the Administrator.

G. No horizontal dimension of a mixing zone in lakes or bays shall at any time be greater than five times any other horizontal dimension.

H. Mixing zones should not overlap or intersect at any time nor should the areas covered by mixing zones at one time or another overlap or intersect.

I. Mixing zones shall not intersect the bottom of the receiving water unless the Environmental Protection Agency and the State determine that the resident biota will not be adversely affected.

J. Heated water discharges to thermally stratified waters shall be to the epilimnion except where it can be demonstrated to the Environmental Protection Agency and the State that such discharges to other strata would be beneficial for fisheries management.

K. Heated water discharges shall not be permitted to cause a thermocline of other than a transient nature to be created over an area larger than the maximum mixing zone surface area. The temperature difference across such a thermocline shall not exceed 5 degrees Fahrenheit.

The Environmental Protection Agency is recommending that a policy statement be adopted in regard to phosphorus levels to the effect that "Total phosphorus as P should not exceed 100 ug/l in any stream nor exceed 50 ug/l in any reservoir or lake, or in any stream at the point where it enters any reservoir or lake." This policy is identical to that presented in the 1968 publication, Water Quality Criteria.

It is strongly recommended that the State coordinate closely with neighboring States to minimize inconsistencies in standards among contiguous States.

COLORADO DEPARTMENT OF HEALTH
Water Quality Control Commission

Adopted: May 22, 1979
Effective: July 10, 1979
Amended: December 12, 1983
Effective: January 30, 1984

3.1.0 ~~REGULATIONS ESTABLISHING BASIC STANDARDS AND AN ANTIDEGRADATION STANDARD AND ESTABLISHING A SYSTEM FOR CLASSIFYING STATE WATERS, FOR ASSIGNING STANDARDS, AND FOR GRANTING TEMPORARY MODIFICATIONS~~

BASIC STANDARDS AND METHODOLOGIES

3.1.1 ~~AUTHORITY~~ AUTHORITY AND SCOPE

These Regulations are promulgated pursuant to C.R.S. 1973, 25-8-101 et seq., as amended, and in particular, 25-8-203 and 25-8-204. THEY PROVIDE BASIC STANDARDS AND A SYSTEM: FOR CLASSIFYING STATE WATERS; FOR ASSIGNING STANDARDS; AND FOR GRANTING TEMPORARY MODIFICATIONS.

3.1.2 PURPOSES

These Regulations establishing basic standards and an antidegradation standard and establishing a system for classifying State waters, for assigning standards, and for granting temporary modifications (hereinafter referred to as "Regulations") and accompanying Tables are the foundation for the classification of the waters of the State of Colorado, as prescribed by the Colorado Water Quality Control Act. They are intended to implement the State Act by maintaining and improving the quality of the waters of the State. These Regulations and accompanying Tables are based on the best available knowledge to insure the suitability of Colorado's waters for beneficial uses including public water supplies, domestic, agricultural, industrial and recreational uses, and the protection and propagation of terrestrial and aquatic life. They are further intended to be consistent with the 1983 and 1985 goals and objectives of the Federal Act. These Regulations shall be construed in a manner consistent with these purposes and shall be considered part of the implementation of the 1983 and 1985 goals and objectives.

3.1.3 INTRODUCTION

These Regulations and Tables present a classification system which establishes beneficial use categories together with basic standards (Section 3.1.11), an antidegradation standard (Section 3.1.8), and numeric Tables which define the conditions generally necessary to maintain and attain such beneficial uses. In addition, they establish procedures for classifying the waters of the State, for assigning water quality

3.1.3 (continued)

standards, and for continued review of the classifications and standards.

The classifications will be assigned by applying the system to specific waters of the State, including surface and groundwaters, in accordance with proper procedures, including public hearings. The basic standards and the antidegradation standard will apply to all waters of the State at the effective date of these Regulations. Whenever a specific stream segment or body of water receives a classification for one or more of the uses, additional numeric standards may be assigned. All classified uses will be protected. This does not mean that any entity has the right to rely on the presence of specific pollutants in the stream even though those pollutants may be utilized by the entity. Water quality standards, temporary modifications of numeric standards, and classifications shall be reviewed at least one every three (3) years and revised where appropriate. NO PROVISION OF THIS REGULATION SHALL BE INTERPRETED SO AS TO SUPERCEDE, ABROGATE, OR IMPAIR RIGHTS TO DIVERT WATER AND APPLY WATER TO BENEFICIAL USES.

3.1.4 IMPLEMENTATION

No pollutant may be released into any State waters without first receiving the treatment or other corrective action necessary to protect the legitimate and beneficial uses of such waters. Facilities, processes, activities, or waste piles shall be conducted, operated, and maintained to prevent any adverse effects to the classified uses of classified waters and beneficial uses of unclassified waters to which they discharge. Failure to do so will be considered a violation of these Regulations and of the Colorado Water Quality Control Act.

3.1.5 DEFINITIONS

See the Colorado Water Quality Control Act, C.R.S. 1973, 25-8-101 et seq., as amended, and the codified water quality regulations for additional definitions.

(1) "ACT" means the Colorado Water Quality Control Act, C.R.S. 1973, 25-8-101 et seq., as amended.

(2) "ANTIDEGRADATION STANDARD" means the standard established in Section 3.1.8.

3.1.5 (continued)

(3) "BASIC STANDARDS" means those standards as established in Section 3.1.11.

(4) "BENEFICIAL USES" means those uses of the waters of the State to be protected such as those identified in the classification system.

(5) "BMP" (Best Management Practices) means a practice or a combination of practices that is determined by a governmental agency after problem assessment, examination of alternative practices, and appropriate public participation, to be the most effective, practicable (including technological, economic, and institutional considerations) means of preventing or reducing the amount of pollution generated by nonpoint sources to a level compatible with quality goals.

(6) "COMMISSION" Means the Colorado Water Quality Control Commission.

(7) "DIVISION" Means the Division of Administration of the Colorado Department of Health of which the Water Quality Control Division is a part.

(8) "FEDERAL ACT" means the Clean Water Act, U.S.C. Section 1251 et seq., as amended.

(9) "LC-50" means the concentration of a parameter that is lethal to 50% of the test organisms within a defined time period.

(10) "MIXING ZONE" means that area of a water body designated on a case-by-case basis by the Division which is contiguous to a point source and in which standards may not apply.

(11) "NUMERIC VALUE" means the measured concentration of a parameter.

(12) "PARAMETER" means the chemical constituents or other characteristics of the water such as algae, fecal coliform, total dissolved solids, dissolved oxygen, or the magnitude of radioactivity levels, temperature, pH, and turbidity, or other relevant characteristics.

3.1.5 (continued)

(13) "PERMIT" means a National Pollutant Discharge Elimination System (NPDES) permit or other state water quality permit.

(14) "SALINITY" means total dissolved solids (TDS).

(15) "STANDARD" means a narrative and/or numeric restriction established by the Commission applied to waters of the State to protect one or more beneficial uses of such waters. Whenever only numeric or only narrative standards are intended, the wording shall specifically designate which is intended.

(16) "TABLES" means Tables I, II, ~~III~~, AND III, ~~and IV~~ appended to these Regulations, which set forth accepted levels for various parameters which will generally protect the beneficial uses of the waters of the State. These Tables are not adopted as regulations.

(17) "USES" - see Beneficial Uses.

(18) "WATERS OF THE STATE" means any and all surface and subsurface waters which are contained in or flow in or through this State except waters in sewage systems, waters in treatment works of disposal systems, waters in potable water distribution systems, and all water withdrawn for use until use and treatment have been completed. "Waters of the State", "waters", "State waters", and "water bodies" are used interchangeably and mean surface and groundwaters of Colorado coming under the above definition. Whenever only surface or only groundwater is intended, the wording shall specifically designate which is intended.

(19) "WATER QUALITY STANDARD" means standard.

3.1.6 PROCESS FOR ASSIGNING CLASSIFICATIONS

The Commission is responsible for classifying the waters of the State as set forth in C.R.S. 1973, 25-8-202(1)(a), and 25-8-203. All waters of the State ~~shall~~ MAY be classified in one or more of the use classifications as set forth in Section 3.1.12.

Waters shall be classified for ~~all uses for which they are suitable or are to become suitable. It should be noted that existing high quality waters may include all beneficial uses~~. THE PRESENT BENEFICIAL USES OF THE WATER, OR THE BENEFICIAL USES THAT MAY BE REASONABLY EXPECTED IN THE FUTURE FOR WHICH THE WATER IS SUITABLE IN ITS PRESENT CONDITION OR THE BENEFICIAL USES FOR WHICH IT IS TO BECOME SUITABLE AS A GOAL. The assignment of one or more classifications to a portion of the waters of the State is based upon its current suitability for the designated uses

3.1.6 (continued)

or goals for future uses. Where the use classification is based upon a future use for which the waters are to become suitable, the numeric standards assigned to such waters to protect the use classification may require a temporary modification to the underlying numeric standard and an implementation plan for eliminating the temporary modification.

When assigning classifications to waters of a given area, the Commission will consider the goals, objectives, and requirements of Federal and State statutes and regulations, recommendations of the areawide water quality management plans (208 plans); 208 plans of adjoining regions; testimony, comments, and documents presented at public hearings on the issue; and other relevant information.

(1) Considerations in Assigning Classifications

The following will serve to guide the Commission in assigning classifications:

(a) Classifications should be directed towards the realization of the water quality goals as set forth in the Federal and State Acts.

(b) It is State law and policy to prevent any water quality degradation that can interfere with present uses.

(c) Upstream classifications must not jeopardize downstream classifications or actual uses.

(d) Classifications must protect all current classified and actual uses, unless it is determined after a public hearing that downgrading is justifiable. (See Section 3.1.6(2)(b)). A reclassification from A_1, A_2, B_1, or B_2 to Aquatic Life, Class 1 or Class 2, shall not constitute a downgrading.

(e) Classifications should be for the highest water quality attainable. Attainability is to be judged by whether or not the use classification can be attained in approximately twenty (20) years by any recognized control techniques that are environmentally, economically, and socially acceptable as determined by the Commission after public hearings.

(f) Non-chemical quality parameters such as flow and stream bed conditions are valid quality concerns.

20-955 O—84——78

3.1.6 (continued)

(2) Upgrading and Downgrading

Upgrading is a change in classification which designates one or more new additional uses. Downgrading is a change in classification which eliminates one or more presently designated uses. The term "uses" refers to those beneficial uses identified in the classification categories of Section 3.1.12.

(a) Upgrading

The State shall maintain those water use classifications which are currently being attained. Where existing classifications specify fewer designated water uses than those which are presently being attained, the Commission shall upgrade the designated classification to reflect the uses actually being attained.

(b) Downgrading

At a minimum, the State shall maintain those water use classifications currently designated by stream classifications in effect as of the date of these Regulations, unless it can be demonstrated that the existing classification is not presently being attained and cannot be attained within a twenty (20) year time period. Nonattainability must be due to at least one or more of the following conditions:

(i) Natural conditions deemed uncorrectable within a twenty (20) year period; or

(ii) past human-induced conditions deemed uncorrectable within a twenty (20) year time period; or

(iii) the imposition of the necessary controls or corrective measures would result in substantial areawide adverse economic and social impact. In the application of this condition, it must be demonstrated that control strategies more severe than the strictest appropriate control required by the Federal Act would be required and that no reasonable alternative control

3.1.6 (continued)

strategies are available. In determining what constitutes a substantial areawide adverse economic and social impact, the Commission will be guided by Water Quality Standards, Chapter V, Guidelines for State and Areawide Water Quality Management Program Development, EPA 1976, and other similar documents;

(iv) agricultural practices which are considered satisfactory for the locality. It must be demonstrated that these agricultural practices preclude the present classifications. Satisfactory practices will be approved by the Commission based on evidence from areawide 208 agencies, soil conservation districts, agricultural extension services and other public input.

An additional reason for downgrading will be where previous classifications had no basis in fact and did not reflect actual beneficial uses.

(3) Procedures for Assigning or Changing Classifications

Assigning or changing a classification shall be accomplished by rule after a rulemaking hearing. Rulemaking hearings to consider a classification will be conducted according to the Procedural Regulations of the Commission. A proposal regarding a classification may be considered at any time. Any interested person shall have the right to petition the Commission to assign or change a stream classification. Such petition shall be open to public inspection. Pursuant to C.R.S. 1973, 24-4-103(7), action on such petition shall be within the discretion of the Commission. The Commission may also decide to consider a classification on its own motion. Any public hearing on a classification will be preceded by at least twenty (20) days notice. If a classification hearing is combined with a standard-setting hearing, there will be at least sixty (60) days notice.

In making a decision regarding a proposed classification, the Commission will consider the principles set forth in these Regulations. The decision will be made by the Commission applying its expertise after analyzing the evidence presented at public hearing and considering the requirements of law, its own policies, and all other matters deemed pertinent in the discretion of the Commission.

3.1.7 PROCESS FOR ASSIGNING STANDARDS AND GRANTING, EXTENDING, OR REMOVING TEMPORARY MODIFICATIONS

(1) Assigning Standards

The Commission is responsible for promulgating Water Quality Standards as set forth in C.R.S. 1973, 25-8-204. Standards may be narrative and/or numeric and include the following:

(a) Antidegradation Standard

The antidegradation standard in 3.1.8 shall apply to all waters of the State at the effective date of these Regulations.

(b) Basic Standards

The basic standards in 3.1.11 shall apply to all waters of the State at the effective date of these Regulations.

(c) Numeric Standards

A numeric standard may be assigned by the Commission either to apply on a statewide basis or to specific waters of the State. A numeric standard will be assigned by the Commission when it is presented with evidence that a particular numeric level for a parameter is the suitable limit for protecting the classified use. A numeric standard consists of a numeric level and may include a description as to how that numeric level is to be measured. A numeric standard may be exceeded due to temporary natural conditions such as unusual precipitation patterns, spring runoff or drought. Such uncontrollable conditions are not cause for changing the numeric standard.

A temporary modification of a numeric standard may be granted by the Commission if the numeric standard is not being met at the present time, but such numeric standard is necessary to allow the full attainment of the classified use.

The numeric levels for various parameters in Tables I, II, ~~III,~~ AND III, ~~and IV~~ are levels determined by the Commission after careful analysis of all available information and are generally considered to protect

3.1.7 (continued)

the beneficial use classifications. They are intended to guide the Commission and others at the use classification and numeric-standard-setting hearings. They carry no presumptive validity or applicability. Numeric standards will be assigned based on the evidence presented at the classification and numeric-standard-setting hearings. Numeric standards may not necessarily be assigned for all constituents listed in the Tables. Entities such as 208 agencies, local municipalities and industries, citizens' groups, the Water Quality Control Division, state and federal agencies, environmental organizations, and other interested persons having specific water quality data for the waters being classified, are encouraged to present such information.

(2) Granting, Extending, and Removing Temporary Modifications to Numeric Standards

Where a numeric standard is not being met at the present time, a temporary modification to the numeric standard may be granted by the Commission. The presence of a modification will be indicated by adding the words "temporarily modified" to the underlying numeric standard. A temporary modification may be granted to an entire stream or water body or to any portion thereof. It may be granted at the time a numeric standard is assigned or at any later time. When the temporary modification expires or is removed by the Commission, the underlying numeric standard will be in full effect. In every case, the modification to the numeric standard shall be temporary. All temporary modifications must be re-examined not less than once every three (3) years.

In general, requests for a temporary modification are preferred over a more permanent downgrading of a present classification where it appears that the conditions causing the lower water quality might be temporary within a twenty (20) year time frame. Retaining a classification higher than the present usage will serve as a reminder that the conditions are correctable and may increase the priority for funding to attain the classified use.

(a) Conditions for Granting a Temporary Modification

The Commission may grant a temporary modification if one of the following conditions is shown to exist:

(i) where the standard is not being met be-

3.1.7 (continued)

cause of human-induced conditions deemed correctable within a twenty (20) year period, such as:

- nonpoint source pollution which cannot be currently controlled using best management practices (BMP) or point source pollution which cannot be controlled using techniques required by the State and Federal Acts but where adequate strategies may become feasible;

- existing dams or other hydrological modifications that may be removed or operated in such a manner as to satisfy the standards;

- deposition of instream toxicants due to past human point or nonpoint source activities which could be removed by natural processes or by human efforts;

- municipal wastewater effluent which requires a higher degree of treatment for which grant funds are not currently available;

- the present inability of private permit holders to fund and construct the necessary control measures.

(ii) where the standards cannot be met because the current imposition of the necessary controls or corrective measures would result in a substantial and areawide economic and social impact. The application of this condition requires a judgment by the Commission of what constitutes a substantial and areawide impact warranting modification. In making this judgment, the Commission will be guided by Water Quality Standards, Chapter V, Guidelines for State and Areawide Water Quality Management Program Development, EPA 1976, or similar

3.1.7 (continued)

guidelines promulgated in the future by EPA and other relevant information.

(b) Eliminating the Need for A Temporary Modification

Areawide wastewater management plans (208 plans) and plan updates, discharge permits, wasteload allocations, planning, design, and construction of new, enlarged, or improved facilities, management practices, and other water quality controls and actions shall be geared toward fully attaining the classified use and underlying numeric standard and assist in eliminating the need for the temporary modification. However, wasteload allocations designed to eliminate the need for the temporary modification will be imposed only at the time that the conditions requiring the temporary modification are, in fact, correctable.

(c) Duration of a Temporary Modification

When a temporary modification is granted, the duration of the temporary modification will be set by the Commission if the time limit can be determined through testimony given at the hearing on the temporary modification. In any case, all temporary modifications must be re-examined not less than once every three (3) years to determine whether or not the temporary modification should be eliminated or extended. For example, the underlying numeric standard may have been attained, new nonpoint source control strategies or other technologies or strategies may have been developed that eliminate the need for the temporary modification, or it may become apparent that the underlying numeric standard is not attainable within a twenty (20) year time frame.

The duration of a temporary modification may depend on the availability of public funds for construction of the necessary municipal controls. Availability of public funds depends on local, state, and federal appropriations for wastewater treatment, the assignment of funding priorities by the Commission and due diligence in obtaining funds by municipalities. The ability of private permit holders to fund and con-

3.1.7 (continued)

struct necessary control measures also will be considered by the Commission when determining whether to extend a temporary modification.

In making a decision as to whether a temporary modification should be removed or extended, the Commission will consider whether those individuals utilizing the temporary modification have agreed to an implementation plan for eliminating the need for the temporary modification, whether such individuals have demonstrated due diligence in trying to implement such a plan, the impact on the uses of the stream in the area of the temporary modification and upstream and downstream of that area, and all other relevant factors.

(d) Procedures for Assigning or Changing a Standard or Granting, Removing, or Extending a Temporary Modification

Assigning or changing a standard or granting, removing, or extending a temporary modification shall be accomplished by a rule after a rulemaking hearing. Rulemaking hearings shall be conducted according to the Procedural Regulations of the Commission. A proposal regarding a standard or a temporary modification may be considered at any time.

Any interested person shall have the right to petition the Commission to consider a standard or a temporary modification. Such a petition shall be open to public inspection. Pursuant to C.R.S. 1973, 24-4-103(7), action on such petition shall be within the discretion of the Commission. The Commission may also decide to consider a standard or a temporary modification on its own motion. Any public hearing on a standard or a temporary modification will be preceded by sixty (60) days notice.

In making a decision regarding a standard or a temporary modification, the Commission will consider the principles set forth in these Regulations. The decision will be made by the Commission applying its expertise after analyzing the evidence presented at public hearing and considering the requirements of law, its own policies, and all other matters deemed pertinent in the discretion of the Commission.

3.1.8 ANTIDEGRADATION STANDARD

(1) Existing uses shall be maintained as required by state and federal law. No further water quality degradation is allowable which would interfere with or become injurious to existing uses.

(2) High Quality Waters - Class 1 - no degradation shall be allowed in High Quality Waters - Class 1. (See Section 3.1.13(e)(i). These waters shall be maintained and protected at their existing quality.

(3) High Quality Waters - Class 2 - these waters shall be maintained and protected at their existing quality unless the Commission chooses, after full intergovernmental coordination and public participation, to allow lower water quality as a result of necessary and justifiable economic or social development. See Section 3.1.13(e)(ii). In no event, however, may degradation of water quality interfere with or become injurious to existing uses.

(4) Waters Other Than High Quality Waters - the numeric values of waters other than high quality waters may change; however, a quality must be maintained which will protect the existing and classified uses.

3.1.9 FLOW CONSIDERATIONS

(1) Low Flow Exceptions

Water quality standards shall apply at all times except where surface waters are below minimum annual average seven-consecutive-day flow expected to occur once in ten (10) years. For certain substances, such as ammonia, the low flow exceptions may be based on the seasonal average seven-consecutive-day low flow expected to occur once in ten (10) years. Each season will normally consist of a minimum of three months.

(2) Waters Not Yet Classified

Discharges to waters not presently classified must meet established effluent limitation regulations, the basic and antidegradation standards and control regulations. Effluent flows which reach a classified body of water, even though the discharge point is to a water not yet classified, must be of a quality which will not cause the standards of the classified body of water to be violated.

(3) Mixing Zone

(a) The mixing zone is that area of a water body designated

3.1.9 (continued)

on a case-by-case basis by the Division which is contiguous to a point source and in which the standards may not apply. The mixing zone is intended to serve as a zone of initial dilution in the immediate area of a discharge; however, the ecological and human health effects of some pollutants may be so adverse that a mixing zone for such pollutants will not be allowed.

(b) The size and shape of the mixing zone will be determined by the Division considering the following factors:

(i) Where necessary to protect aquatic life, there shall be a zone of passage around the mixing zone which allows sufficient passage of aquatic life so as not to have a detrimental effect on their population.

(ii) Biological communities or populations of imported species shall not be interfered with to a degree which is damaging to the ecosystem in adjacent waters; nor shall there be detrimental effects to other beneficial uses.

(iii) There shall be no mixing zones for certain harmful substances such as those identified pursuant to 307(a) of the Federal Act.

(iv) Mixing zones shall not overlap so as to cause harmful effects in adjacent waters or to interfere with zones of passage.

(v) Concentrations of harmful substances in the mixing zone shall not exceed the 96-hour LC-50 concentrations for biota significant to the aquatic community.

(vi) The conditions of the mixing zone shall be controlled so as to comply with items 1(a) (b) and (f) of the Basic Standards, Section 3.1.11.

(vii) In establishing a mixing zone, potential

3.1.9 (continued)

groundwater aquifer contamination shall be considered.

(viii) The Division will also be guided by other concerns such as the mixing zone discussion in EPA, Guidelines for State and Areawide Water Quality Management Program Development, published November 1976, or similar documents.

3.1.10 DISCHARGE TO OTHERWISE DRY STREAM BEDS

"Otherwise dry stream beds" are stream beds which would be dry if effluent were not being discharged into them. To insure that conditions in such stream beds will not impair existing or classified uses in the stream or in downstream waters and will protect groundwater aquifers, discharge limitations more stringent than those established in effluent limitation regulations will be imposed if necessary.

3.1.11 BASIC STANDARDS APPLICABLE TO WATERS OF THE STATE

All waters of the State are subject to the following basic standards; however, discharge of substances regulated by permits which are within those permit limitations shall not be a basis for enforcement proceedings under these basic standards:

(1) Substances attributable to human-induced discharges, as indicated below, not otherwise controlled by permits, BMP's, or plans of operation approved by the Division, shall not be introduced into the waters of the State:

(a) which can settle to form bottom deposits detrimental to the beneficial uses. Deposits are stream bottom buildup of materials which include but are not limited to anaerobic sludges, mine slurry or tailings, silt, or mud; or

(b) which form floating debris, scum, or other surface materials sufficient to harm existing beneficial uses; or

(c) which produce color, odor, or other conditions

3.1.11 (continued)

in such a degree as to create a nuisance or harm existing beneficial uses or impart any undesirable taste to significant edible aquatic species or to the water; or

(d) in amounts, concentrations, or combinations which are harmful to the beneficial uses or toxic to humans, animals, plants, or aquatic life; or

(e) in amounts, concentrations or combination which produce a predominance of undesirable aquatic life; or

(f) in concentrations which cause a film on the surface or produce a deposit on shorelines.

(2) The radioactive materials in surface and groundwaters shall be maintained at the lowest practical level. In no case shall radioactive materials in surface waters be increased by any cause attributable to municipal, industrial, or agricultural practices or discharges so as to exceed the following levels:

Parameter	Picocuries per Liter
Cesium 134	80
Plutonium 238, 239, and 240	15
Radium 226 and 228	5
Strontium 90	8
Thorium 230 and 232	60
Tritium	20,000

No increase in radioactive materials in groundwaters of the State over naturally-occurring concentrations shall be permitted, except under specific circumstances that must be approved by the Commission or the Division pursuant to applicable regulations.

(3) THE ORGANIC PARAMETERS CONTAINED IN THE FOLLOWING TABLE ARE APPLICABLE TO ALL WATERS OF THE STATE.

NO INCREASE IN ORGANIC PARAMETERS IN GROUNDWATERS OF THE STATE OVER NATURALLY-OCCURRING CONCENTRATIONS SHALL BE PERMITTED, EXCEPT UNDER SPECIFIC CIRCUMSTANCES THAT MUST BE APPROVED BY THE COMMISSION OR THE DIVISION PURSUANT TO APPLICABLE REGULATIONS.

TABLE-IV
ORGANIC PARAMETERS

PARAMETER (1) ORGANIC (mg/l)	RECREATIONAL CLASS 1 Primary Contact	RECREATIONAL CLASS 2 Secondary Contact	AQUATIC LIFE CLASS 1 Cold Water Biota & Warm Water Biota	AQUATIC LIFE CLASS 2	AGRICULTURE	DOMESTIC WATER SUPPLY CLASS 1	DOMESTIC WATER SUPPLY CLASS 2
Chlorinated Pesticides							
Aldrin(2)			0.000003(A,H,I)(3)		To be established on a case-by-case basis

(Polychlorinated PCB Biphenyls) (4)			0.000001(A,H,I)			(4)	(4)
Chlorophenol			0.001(A,H)			0.001(A)	0.001(A)
Monohydric phenol			0.5(H)			0.001(A)	0.001(A)
Benzidine			0.0001(A,I)			0.0001(E)	0.0001(E)

TABLE IV - FOOTNOTES

(1) All organics not on this partial list are covered under Basic Standards, Section 3.1.11.

(2) The persistence, bioaccumulation potential, and carcinogenicity of these organic compounds cautions human exposure to a minimum (EPA).

(3) Aldrin and dieldrin in combination should not exceed 0.000003 mg/l.

(4) Every reasonable effort should be made to minimize human exposure (EPA).

3.1.12 SALINITY AND SUSPENDED SOLIDS

The Commission recognizes that excessive salinity and suspended solids levels can be detrimental to the water use classifications. The Commission has established salinity standards for the Colorado River Basin ("Water Quality Standards for Salinity including Numeric Criteria and Plan of Implementation for Salinity Control", Commission Regulation 3.9) but has not established or assigned other standards for salinity or suspended solids. This section is reserved for additional salinity and suspended solids control practices to be developed through 208 plans, coordination with agricultural agencies, and further studies of existing water quality.

3.1.13 STATE USE CLASSIFICATIONS

Waters are classified according to the uses for which they are presently suitable or intended to become suitable. When the term "waters" is used without the modifiers "surface" or "ground", it includes both surface and groundwater. In addition to the classifications, one or more of the qualifying designations described in paragraph 3.1.13(2), may be appended.

(1) Classifications

(a) Recreation

(i) Class 1 - Primary Contact

These surface waters are suitable or intended to become suitable for prolonged and intimate contact with the body or for recreational activities when the ingestion of small quantities of water is likely to occur. Such waters include but are not limited to those used for swimming.

(ii) Class 2 - Secondary Contact

These surface waters are suitable or intended to become suitable for recreational uses on or about the water which are not included in the primary contact subcategory.

(b) Agriculture

These waters are suitable or intended to become suitable for irrigation of crops usually grown in Colorado and which are not hazardous as drinking water for livestock.

(c) Aquatic Life

These surface waters are suitable or intended to become

3.1.13 (continued)

suitable for the protection and maintenance of aquatic life forms as described below:

(i) Class 1 - Cold Water Aquatic Life

These waters provide, or could provide, a habitat consisting of water quality levels and other considerations such as flow and stream bed characteristics which do or could protect and maintain a wide variety of cold water biota, including sensitive species. Cold water biota are considered to be life forms, including trout, in water where temperatures do not normally exceed 20° C. If there are limitations to the potential variety of life forms, they are due primarily to uncorrectable water quality conditions. This information will be considered in assigning specific standards.

(ii) Class 1 - Warm Water Aquatic Life

These waters provide, or could provide, a habitat consisting of water quality levels and other considerations such as flow and stream bed characteristics which do or could protect and maintain a wide variety of warm water biota, including sensitive species. Warm water biota are considered to be the life forms in waters with temperatures frequently exceeding 20° C. If there are limitations to the potential variety of life forms, they are due primarily to uncorrectable water quality conditions. This information will be considered in assigning specific standards.

(iii) Class 2 - Cold and Warm Water Aquatic Life

These are waters where the potential variety of life forms is presently limited primarily by flow and stream bed characteristics. Standards will be assigned to protect existing species and encourage the establishment of more sensitive species which are compatible with the flow and stream bed characteristics.

(d) Domestic Water Supply

These waters are suitable or intended to become suitable for

3.1.13 (continued)

potable water supplies. There may be waters which do not fit into either the Class 1 or Class 2 classifications but which may be suitable for domestic water supplies after special treatment.

(i) Class 1 - Uncontaminated Groundwaters

These are groundwaters which receive a high degree of natural protection and meet, without treatment, all Colorado drinking water regulations and any revision, amendments, or supplements thereto. Colorado drinking water regulations require disinfection of all domestic water supplies regardless of source unless a waiver has been obtained.

(ii) Class 2 - Waters Requiring Disinfection and/or Standard Treatment

These are waters which, after receiving approved disinfection such as simple chlorination or its equivalent or which after receiving standard treatment (defined as coagulation, flocculation, sedimentation, filtration, and disinfection with chlorine or its equivalent) will meet Colorado drinking water regulations and any revisions, amendments, or supplements thereto. This class may include groundwaters which, due to natural or human causes, do not meet the requirement for Class 1 waters.

(e) Existing High Quality Waters

Waters currently of a quality higher than necessary to support primary contact recreation and propagation of fish, shellfish, and wildlife and are generally suitable for agriculture and domestic water supply may be classified as high quality waters. This classification precludes the necessity to classify for other beneficial uses.

(i) Class 1 - These are high quality waters which constitute an outstanding state or national resource such as waters in national and state parks and forests, wildlife refuges, and waters of exceptional recreational and ecological significance.

20-955 O—84——79

3.1.13 (continued)

For example, waters which provide a unique habitat for an endangered or threatened species or rivers designated under the Wild and Scenic Rivers Act may be designated as outstanding state or national resource waters. No degradation of these waters will be allowed; thus, these waters will be protected and maintained at their existing quality.

(ii) Class 2 - These are other high quality waters which are not classified as outstanding state or national resources. These waters shall be maintained and protected at their existing quality unless the Commission chooses, after full intergovernmental coordination and public participation, to allow lower water quality as a result of necessary and justifiable economic or social development. In no event, however, may degradation of water quality interfere with or become injurious to existing instream water uses.

(2) Qualifiers

The following qualifiers may be appended to any classification to indicate special considerations. Where a qualifier applies, it will be appended to the use classification; for example, "Class 1, Warm Water Aquatic Life (Goal)".

(a) Goal

A qualifier which indicates that the waters are presently not fully suitable but are intended to become fully suitable for the classified use. "Goal" will be used to indicate that a temporary modification for one or more of the underlying numeric standards has been granted.

(b) Seasonal

A qualifier which indicates that the water may only be suitable for a classified use during certain periods of the year. DURING THOSE PERIODS WHEN WATER IS IN THE STREAM, THE STANDARDS AS DEFINED IN 3.1.7(1)(c) AND 3.1.9(1) SHALL APPLY.

(c) Interrupted Flow

A qualified which indicates that due to natural or human-induced conditions the continuity of flow is broken, not necessarily according to a seasonal schedule. This quali-

3.1.13 (continued)

fier appended to a classification indicates that the flow conditions still permit the classified use during period of flow. THE PRESENCE OF WATER DIVERSIONS IN A STREAM DOES NOT CHANGE THE CLASSIFICATIONS AND STANDARDS, AND THE STANDARDS DO NOT REQUIRE THAT FLOW BE MAINTAINED IN THE STREAM.

(3) Areas Requiring Special Protection

In special cases where protection of beneficial uses requires standards not provided by the classification above, special standards may be assigned after full public notice and hearings. Cases where special protection may be needed include but are not limited to wildlife preserves and waterbodies endangered by eutrophication.

3.1.14 INTEGRATION INTO DISCHARGE PERMITS

(1) A classification and/or standard assigned by the Commission to any segment of waters of the State may affect the degree of treatment required prior to discharge of effluent to such waters. Where effluent limitation regulations applicable to discharges into a segment of state waters or Best Management Practices (BMP's) or other activities are adequate to maintain or attain the assigned classifications and standards, only the effluent limitation regulations will control the discharge. (See Regulation 10.1). Such segments are termed "effluent limited".

(2) Where the effluent limitation regulations applicable to the discharge or BMP's or other controls are inadequate to maintain or attain the assigned classifications and standards, a degree of treatment which will maintain or attain such classifications and standards will be required. Such segments are termed "water quality limited".

(3) For water quality limited segments, Total Maximum Daily Loads (TMDL's) and Waste Load Allocations will be developed and integrated into discharge permits. Flow modifications and other factors may also affect TMDL's and may have a corresponding effect on discharge permits. Permits will also be written in accordance with any temporary modification granted by the Commission to the underlying numeric standards assigned to those waters and a plan for eliminating the temporary modifications shall be included in the discharge permits. The requirements for such plans are discussed in Section 3.1.7(2)(b).

(4) Discharge permits will be issued by the Division to comply with basic, narrative, and numeric standards and control regulations

3.1.14 (continued)

so that all discharges to waters of the State protect the classified uses.

(5) Dischargers will not be required to regularly monitor for any parameters that are not identified by the Division as being of concern.

3.1.15 SEVERABILITY

The provisions of these regulations are severable, and if any provisions or the application of the provisions to any circumstances is held invalid, the application of such provision to other circumstances and the remainder of these Regulations shall not be affected thereby.

3.1.16 STATEMENT OF BASIS AND PURPOSE

These Regulations establish Basic Standards and an Antidegradation Standard (Section 3.1.11 and Section 3.1.8). They also establish a system for classifying State waters, for assigning standards, and for granting temporary modifications. These Regulations do not classify State waters, nor do they assign any numeric standards except those radiological standards listed under Basic Standards. In addition, one of these Regulations is a control regulation. Section 3.1.4 makes it a violation to release pollutants into State waters without the treatment or other corrective action necessary to protect the beneficial uses of the waters, or to conduct, operate, or maintain facilities, processes, activities, or waste piles in such a way as to have any adverse effect on the beneficial or classified uses. This section gives the Colorado Water Quality Control Division greater flexibility to protect and maintain the quality of State waters. It is based on C.R.S. 1973, 25-8-102, 25-8-202(1), and 25-8-207(c).

The Colorado Water Quality Control Act requires the Commission to classify all waters of the State. These Regulations are intended to comply with the legislative intent as stated in C.R.S. 1973, 25-8-102(2):

> *"It is further declared to be the public policy of this state to conserve state waters and to protect, maintain, and improve the quality thereof for public water supplies, for protection and propagation of wildlife and aquatic life, and for domestic, agricultural, industrial, recreational, and other beneficial uses; to provide that no*

3.1.16 (continued)

pollutant be released into any state waters without first receiving the treatment or other corrective action necessary to protect the legitimate and benefical uses of such waters; to provide for the prevention, abatement, and control of new or existing water pollution; and to cooperate with other states and the federal government in carrying out these objectives".

In addition, the subject Regulations are consistent with the Federal Clean Water Act which states, in part: (Section 101(a))

"The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.....
(1) it is the national goal that discharge of pollutants into the navigable waters be eliminated by 1985;
(2) it is the national goal that wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983;"

C.R.S. 1973, 25-8-203(2) provides that the types of water classes shall be based on or intended to indicate relevant characteristics such as:

"(c) Present uses of the water, the uses for which the water is suitable in its present conditions, or the uses for which it is to become suitable as a goal" and
"(e) The need to protect the quality of the water for human purposes and also for the protection and propagation of wildlife and aquatic life;"

Such regulations are known as Classifications. C.R.S. 1973, 25-8-204 also requires that the Commission shall promulgate regulations which describe water characteristics or the levels of protection necessary to protect the beneficial uses. Such regulations are referred to as Standards.

In formulating the Regulations governing stream classifications, the

3.1.16 (continued)

Commission relied upon portions of the January 1974 Water Quality Standards and Stream Classifications, on the work of a broadly-based scientific committee which met publicly for several years, on testimony given at two oversight hearings and two series of public hearings, on workshops involving the public, and on documentary evidence including, but not limited to, the following:

1. EPA - Quality Criteria for Water, July 1976, U.S. Environmental Protection Agency, U.S. Government Printing Office: 1977 0-222-904, Washington, D.C. 256 p.

2. EPA - Water Quality Criteria 1972, Ecological Research Series, National Academy of Sciences, National Academy of Engineering, EPA-R3-73-033, March 1973, Washington, D.C. 594 p.

3. Davies, P.H. and Goettl, J.P., Jr., July 1976, Aquatic Life - Water Quality Recommendations for Heavy Metal and Other Inorganic Toxicants in Fresh Water, submitted to Water Quality Standards Revision Committee and Colorado Water Quality Control Commission, 29 p.

4. Parametrix Inc., Attachment II - Parametrix Reports - Toxicology Assessments of As, Cu, Fe, Mn, Se and Zn, May 1976, Bellevue, Washington, 98005, submitted to Water Quality Control Commission by Gulf Oil, Inc. 161 p.

5. EPA - National Interim Primary Drinking Water Regulations, 40 CFR, Part 141 (Code of Federal Regulations) Washington, D.C.

6. EPA - Proposed National Secondary Drinking Water Regulations, Federal Register, Vol. 42, No. 62, March 1977, pages 17148-17149.

7. Material generated by the Committee on Colorado Water Quality Standards and Stream Classification, such as Summary of Concentration Limits for the Radionuclides Under Consideration by Numbers Subcommittee , July 1976, Milton W. Lammering, Ph.D., Chief, Technical Investigations Branch, Surveillance and Analysis Division, EPA, Washington, D.C. 4 p.

3.1.16 (continued)

More than thirty meetings, on notice to the public, were held during the formulation of these Regulations.

Section 303 of the Federal Act requires that water quality standards be established for every state. EPA will only promulgate such standards if the state does not promulgate acceptable water quality standards itself. Both the Federal and the State Acts require review of the water quality standards and stream classifications every three years. This review of the standards and classification system is pursuant to that required review.

With the exception of 3.1.4, these Regulations supersede those adopted in May, 1978. The May 1978 regulations superseded or were to phase out the January 1974 Water Quality Standards and Stream Classifications and the Temporary Stream Classification Exception Designated as Class C, effective October, 1976. As the Commission reclassifies State waters, previous classifications will be phased out. Those which have never been classified will be controlled by the Basic and Antidegradation Standards of these Regulations, by effluent limitations, and by classified uses in adjacent waters. Until such time as they are reclassified, streams which were classified under the previous system will be controlled by the limitations accompanying the previous system and all the factors mentioned above.

These Regulations establish basic water quality standards (called Basic Standards) which differ very little from the Basic Standards adopted in January, 1974. Previous Basic Standards stated that *"the radioactivity of surface waters shall be maintained at the lowest practicable level and shall, in no case, except when due to natural causes, exceed the latest federal drinking water standard....."*. To further clarify the previous Basic Standards, the present Regulations set numeric standards for six radioactive substances. Four of the levels - Cesium 134, Radium 226 and 228, Strontium 90, and Tritium - are identical to those in the federal drinking water standards. With Plutonium 238, 239, and 240, and Thorium 230 and 232, the numeric standards are consistent with a goal of keeping exposures below 4 millirems per year (the level suggested for other human-made radionuclides in the National Interim Primary Drinking Water Regulations. Because of the difficulty of removing these radionuclides by conventional treatment procedures, it is necessary and important to restrict their levels in the waters. Their potential adverse effect on human health suggests that extreme caution be exercised in their release to State waters. In addition to addressing radioactivity, Basic Standards set forth certain other minimum standards apply-

3.1.16 (continued)

ing to all waters regardless of beneficial use(s). These Basic Standards (Section 3.1.11) are essential to a program designed to protect the waters of the State because they describe the fundamental condition that all waters must meet. All of the previously-cited evidence and testimony form the basis for the Basic Standards.

An Antidegradation Standard, required by state and federal law, is included. It requires that the quality of the waters cannot be degraded so as to interfere with their present uses. Furthermore, certain high quality waters may be identified. Because of the special value of these waters, no parameters may be degraded (High Quality Water - Class 1), or may be degraded only when the Commission allows lower water quality as a result of necessary economic or social development (High Quality Water - Class 2).

Under the previous system (January 1974), waters were classified as A_1, A_2, B_1, or B_2. Waters designated A_1 or A_2 were defined as waters suitable or to become suitable for all purposes for which raw water is customarily used, including primary contact recreation. Waters classified B_1 or B_2 were defined similarly except they were not protected for primary contact recreation. A_1 and B_1 applied to cold waters and A_2 and B_2 to warm waters. The temperature classifications were consistent with characteristics for cold and warm water aquatic life. Because that classification system was not comprehensive, dissatisfaction was expressed by many including those being regulated and those doing the regulating. Therefore, a new system was devised where uses to be protected could be identified individually and levels for various parameters could be identified which would protect the specified use. Subsequently, a stream could be classified for as many of those uses for which it is presently suitable and those for which it is to become suitable within the next twenty years.

The Classification Subcommittee of the Water Quality Standards and Stream Classification Committee recommended the following classifications: Recreation (primary contact and secondary contact), Agriculture, Aquatic Life (Cold Water and Warm Water), Domestic Water Supply (two classes). The Subcommittee also recommended a Wildlife Classification for protection of criti-

3.1.16 (continued)

cal wildlife areas. This classification has been dropped, however, in favor of a section entitled "Areas Requiring Special Protection" in which various special situations can be addressed on a case-by-case basis.

An Industrial classification and a Stock Watering Classification were considered and rejected by both the Subcommittee and the Commission. Regarding an Industrial classification, it was decided that water supply requirements for different industries vary so greatly that it would be virtually impossible to decide what parameters and what levels would be appropriate for such a classification. At the request of the cattle and dairy interests, the Agriculture classification was defined so that in addition to being suitable for irrigation, it would also be suitable for stock watering. The rationale was that it would be difficult to segregate the two uses. If, in specific areas, the waters are in fact segregated and numeric standards for those parameters to protect stock watering are not necessary, the Commission can respond by not assigning those standards to those waters.

The Aquatic Life classification went through a number of changes during the public hearing process and was eventually defined in terms of habitat. The temperature differentiation was retained resulting in cold and warm water categories under Class 1. The major change was a differentiation made between waters where the potential life forms are presently limited primarily to flow and stream bed characteristics rather than water quality characteristics. An additional classification was added primarily in response to federal requirements that high quality waters be identified in each state. This classification is appropriately entitled High Quality Waters (in two classes).

Stream classifications may either be upgraded or downgraded upon reclassification. Upgrading means that additional uses are identified and will be protected. Downgrading will eliminate one or more of the presently classified uses. A finding must be made by the Commission that the stream is not attaining that use and that such use is unattainable in a twenty-year period because of at least one of the conditions set forth. The first three conditions are essentially the same as the conditions for the Class C Exception under the previous system. The Class C was a temporary classification for the purpose of granting a temporary exception for

3.1.16 (continued)

one or more parameter levels otherwise in effect on a stream. The criteria, however, were of a very permanent nature and are now much more appropriately applied to the more permanent downgrading situation. To accommodate the agricultural industry, an additional criterion was established recognizing agricultural practices considered satisfactory for the locality. The twenty-year time period for attainability was used because the areawide wastewater management plans (208 plans) are based on twenty years. The regulations also allow the Commission to find that the former classifications had no factual basis and therefore did not reflect actual beneficial uses and that this would be an additional reason for downgrading.

The concept of the previous Class C Exception is now incorporated into a section entitled Temporary Modifications. When a use classification is assigned to a stream, numeric standards may also be assigned to protect that use. When a numeric standard is not being met at the present time, a temporary modification to this numeric standard may be granted. All planning, discharge permits, new wastewater facilities and other water quality control actions are to be geared towards eliminating the need for the temporary modification. Such temporary modifications must be reviewed at least every three years and may be extended or removed. In general, requests for temporary modifications are preferred over the more permanent downgrading. They serve as reminders that conditions are correctable and may increase the priority for funding to attain the classified use and the underlying numeric standard.

In addition, there are Qualifiers which may be appended to a use classification to indicate special considerations. The "Goal" qualifier indicates that the waters are presently not fully suitable for such use. The "Seasonal" qualifier indicates that the water may only be suitable for the classified use during certain periods of the year. The "Interrupted Flow" qualifier indicates that while flow may be interrupted, the flow conditions still permit the classified use during periods of flow. The expanded use classification, the upgrading and downgrading provisions, the temporary modifications and the qualifiers make this system far more flexible than the previous system.

All waters of the State will be classified under this regulatory system through a process which provides for public notice and a

3.1.16 (continued)

public hearing before any classification or numeric standard is assigned. Whenever possible, the Commission will hold the public hearing in the general locality of the waters being classified. All classifications, standards, and temporary modifications will be assigned by the Commission by rule after consideration of all available data and evidence presented at the hearings, and can be changed only by a new rulemaking decision. Numeric standards will be assigned when there is documentation showing that a particular numeric level is appropriate for protecting the classified use. Standards may be set for an entire stream or for one or more segments thereof. Standards may be assigned at the time classifications are assigned or at any time thereafter. This is intended to be a dynamic process so that new standards may be adopted on a regular basis as the supporting information becomes available. The scientific and technological rationale for the standards will be developed from information obtained at the classification hearings.

Public participation in the process is always encouraged. A change in a classification, standards, or temporary modification may be sought at any time; however, it is within the discretion of the Commission to decide whether or not to consider the proposed change. In any case, all classifications, standards, and temporary modifications must be reviewed every three years.

The establishment of classifications and standards is based on the long-established fact that natural waters have a limited ability to assimilate wastes without rendering the water unfit for various beneficial uses. The quantity of pollutants that can be assimilated by a stream or water body is directly related to the quantity of water available for dilution and assimilation. Stream flows and levels change during the year and from year to year. Extremely low flows or water levels may not provide enough dilution water to assimilate the pollutants which, under normal or high flows, would not impair the assigned uses; therefore, it is reasonable to establish a flow below which the water quality standards assigned to State waters are not in force. This low flow or water level is commonly accepted as the "minimum annual average seven-consecutive-day flow expected to occur once in ten years" - 7-day 10-year low flow. The 7-day 10-year low flow may be determined by various statistical analyses of stream flow records covering at least ten years.

3.1.16 (continued)

The Regulations also permit a seasonal average low flow rather than an annual average low flow. A seasonal average low flow, for instance, may result in a less restrictive discharge permit requirement for ammonia in the winter because of the toxicity relationship to temperature and pH.

Another concept which uses the dilution and assimilative capacity of a stream and may result in a less restrictive discharge permit requirement is the "mixing zone". A mixing zone is intended to serve as a zone of initial dilution in the immediate area of a discharge. The water quality standards assigned to the receiving waters are not in effect in the mixing zone. The Division designates the mixing zone on a case-by-case basis in accordance with the criteria established in the Regulations, Section 3.1.9(3). The mixing zone is well explained in that section and further information can be found in the Federal Water Pollution Agency's Water Quality Criteria, 1968, p. 31.

Attached to the Regulations are four Tables showing numeric levels for various parameters. The Tables are not adopted as regulations. The numeric levels set forth in the Tables are levels established by the Commission after careful analysis of all available information and are generally considered to protect the beneficial use classifications of the waters of the state. They are intended to guide the Commission and others at the use classification and numeric-standard-setting hearings. They carry no presumptive validity or applicability. Numeric standards may not be assigned for all the parameters listed in the Tables, and conversely, standards may be assigned for parameters which are not listed in the Tables.

TABLES

(1) INTRODUCTION

The numeric levels for various parameters in Tables I, II, ~~III,~~ AND III, ~~and IV~~ are levels established by the Commission after careful analysis of all available information and are generally considered to protect the beneficial use classifications of the waters of the State. They are intended to guide the Commission and others at the use classification and numeric-standard-setting hearings. They carry no presumptive validity or applicability. Numeric standards will be assigned based on the evidence presented at the classification and numeric-standard-setting hearings.

Numeric standards may not necessarily be assigned for all parameters listed in the Tables. Besides the parameters in the Tables, there may be other parameters for which numeric standards will be assigned. Entities such as 208 agencies, local municipalities and industries, citizens' groups, the Water Quality Control Division, state and federal agencies, environmental organizations, and other interested persons having specific water quality data for the waters being classified, are encouraged to present such information. These Tables are not adopted as regulations.

The toxic metals for Aquatic Life have different numeric levels for different ranges of average water hardness or alkalinity. Water hardness and alkalinity are being used here as an indication of differences in the complexing capacity of natural waters and the corresponding variation of metal toxicity. Other factors such as organic and inorganic ligands, pH, and other factors affecting the complexing capacity of the waters will be considered.

CHEMICAL DESIGNATIONS IN THE TABLES SHALL BE EQUIVALENT TO THE DESIGNATION USED IN EPA'S MOST RECENT CRITERIA DOCUMENT.

(2) TESTING PROCEDURES

Various testing procedures to determine that numeric values for water quality parameters may be appropriate to present to the Water Quality Control Commission at stream classification hearings. (See Section 3.1.6(3)). These include:

(a) Standard Test Procedures:

(i) Code of Federal Regulations, Title 40, Part 136;

(ii) The latest approved EPA Methods for Chemical Analysis of Water and Wastes;

(iii) Standard Methods for the Examination of Water and Wastewater (current edition), American Public Health Association;

(iv) ASTM Standards, Part 31, Water;

(v) EPA Biological Field and Laboratory Methods

(b) Bioassay Procedures:

(i) The latest EPA Methods for Chemical Analysis of Water and Wastewater; ASTM, Standard Methods for Examination of Water, Wastewater;

(ii) WATER QUALITY CONTROL DIVISION GUIDELINE TITLED: GUIDELINES FOR DEVELOPING SITE SPECIFIC AQUATIC LIFE CRITERIA, WATER QUALITY CONTROL DIVISION. THIS REFERENCE DOES NOT INCLUDE LATER AMENDMENTS TO OR ADDITIONS OF SUCH DOCUMENT AND IS AVAILABLE AT THE OFFICE OF THE DIRECTOR OF THE WATER QUALITY CONTROL DIVISION, 4210 EAST 11TH AVENUE, DENVER, COLORADO.

(iii) Other approved EPA methods

(c) Other Procedures

Other procedures may be deemed appropriate by either the Water Quality Control Commission and/or the Water Quality Control Division.

TABLE I - FOOTNOTES

(1) Where dissolved oxygen levels less than these levels occur naturally, a discharge shall not cause a further reduction in dissolved oxygen in receiving water.

(2) An effluent shall be regulated to maintain aerobic conditions, and a guideline of 2.0 mg/liter dissolved oxygen in an effluent should be maintained, unless demonstrated otherwise.

(3) A 7 mg/liter standard, during periods of spawning of cold water fish, shall be set on a case-by-case basis as defined in the NPDES permit for those dischargers whose effluent would affect fish spawning.

(4) Suspended solid levels will be controlled by Effluent Limitation Regulations, Basic Standards, and Best Management Practices (BMP's).

(5) Temperature shall maintain a normal pattern of diurnal and seasonal fluctuations with no abrupt changes and shall have no increase in temperature of a magnitude, rate, and duration deemed deleterious to the resident aquatic life. Generally, a maximum 3° C increase over a minimum of a four-hour period, lasting for 12 hours maximum, is deemed acceptable for discharges fluctuating in volume or temperature. Where temperature increases cannot be maintained within this range using BMP, BATEA, and BPWTT control measures, the Division will determine whether the resulting temperature increases preclude an aquatic life classification.

(6) Fecal coliform is an indicator only. It may indicate the presence of pathogenic organisms; however, fecal coliform counts from agriculture or urban runoff may not indicate organisms detrimental to human health.

(7) For drinking water with or without disinfection.

20-955 O—84——80

TABLE II

INORGANIC PARAMETERS

PARAMETER	RECREATIONAL		AQUATIC LIFE			AGRICULTURE	DOMESTIC WATER SUPPLY	
	CLASS 1 Primary Contact	CLASS 2 Secondary Contact	CLASS 1 Cold Water Biota	CLASS 1 Warm Water Biota	CLASS 2		CLASS 1	CLASS 2
INORGANICS:					To be established on a case-by-case basis.			
Ammonia (mg/l as N)			0.02 unionized(A)	0.06 unionized(G)			0.5[1](B)	0.5[1](B)
- Total residual Chlorine (mg/l)			0.003(H)	0.003(H)				
Cyanide - Free (mg/l)			0.005(H)	0.005(H)		0.2(G)	0.2(B,D[m])	0.2(B,D[m])
Fluoride (mg/l)							[2](E)	[2](E)
Nitrate (mg/l as N)						100[3](B)	10(A,B)	10(A,B)

TABLE III - FOOTNOTES

(1) Concentrations of total alkalinity or other chelating agents attributable to municipal, industrial or other discharges or agricultural practices should not alter the total alkalinity or other chelating agents of the receiving water by more than 20%. Where the complexing capacity of the receiving water is altered by more than 20% or where chelating agents are released to the receiving water which are not naturally characteristic of that water, specific effluent limitations for pertinent parameters shall be established. In no case shall instream modification or alteration of total alkalinity or other chelating agents be permitted without Commission authorization.

(2) ~~Where required, bioassay procedures may be used to establish standards for a particular situation.~~
IN NO CASE CAN THE SUM OF THE INSTREAM LEVELS OF HEXAVALENT AND TRIVALENT CHROMIUM EXCEED THE WATER SUPPLY STANDARD OF .05 MG/L TOTAL CHROMIUM IN THOSE WATERS CLASSIFIED FOR DOMESTIC WATER USE.

(3) ~~For bioassay, lead concentration is based on soluble lead measurements, i.e., non-filterable lead using a 0.45 micron filter.~~
RESULTS OF BIOASSAY PROCEDURES SUCH AS OUTLINED IN WATER QUALITY CONTROL DIVISION GUIDELINES MAY BE USED TO SET STANDARDS ON A SITE SPECIFIC BASIS.

WATER QUALITY CONTROL COMMISSION
DRAFT: #2 Page 1
DATE: November 25, 1983

3.1.17 STATEMENT OF BASIS AND PURPOSE REGARDING THE ADOPTION OF NON-SUBSTANTIVE CORRECTIONS AND CLARIFICATIONS FOR THE BASIC REGULATIONS AND CORRECTIONS TO THE NUMERIC STANDARDS FOR THE SAN JUAN AND DOLORES, GUNNISON AND LOWER DOLORES, RIO GRANDE, AND THE SOUTH PLATTE RIVER BASINS

In accordance with the requirements of 24-4-103(4), C.R.S. 1973, the Commission makes these findings and adopts this Statement of Basis and Purpose. The Commission, at a public rulemaking hearing November 14, 1983, and December 12, 1983, adopted non-substantive and editorial corrections to clarify the Commission's current regulations numbered respectively 3.1.0, 3.4.0, 3.5.0, 3.6.0, and 3.8.0. These regulations are contained in Article 3, Water Quality Standards and Classifications, of the Policies, Regulations, and Guidelines of the Water Quality Control Commission. (5CCR 1002-8).

In adopting these corrections and clarifications, the Commission considered the economic reasonableness of its action. The scientific or technological rationale of the Commission in justifying the changes to its rules was that it made the classifications and standards which it had previously assigned more technically correct and accurate.

The consolidated changes adopted by the Commission are provided with this Basis and Purpose. The Secretary of State is being provided corrected pages for each of the regulations as replacements for pages previously published in those regulations.

An issue raised during the hearing, was whether or not the table of organic parameters should be moved from the Appendix to the text. The Commission included standards for organic parameters in the regulations it adopted for each of the River Basins of the State. Thus, standards for organic parameters were applicable Statewide, prior to the hearing to consider the changes to which this Statement of Basis and Purpose is applicable. This has had the same effect as would have a basic standard applicable to all waters of the State.

There was testimony that it was confusing to have the table of organic

parameters as criteria guidance subject to change on a stream by stream basis when the parameters had been assigned and were not merely to provide guidance. It was said to be less confusing to have the table in the text of the regulation to provide basic standards.

The Larimer-Weld Regional Council of Governments testified that if the table in question were moved to the regulatory text there was the possibility of a basin standard differing from the general standard. The Commission found that its regulations enabled it to set site specific standards to stream segments as an exception to the basic standard.

The organic parameters in the table are not substances that form a naturally occurring background. They are toxics controlled at the point of sale or use. They are not ambient and subject to the same treatment as are other naturally occurring parameters. The Commission found it inappropriate to regulate these organic constituents in the same manner as are those that can be ambient or uncontrollable background parameters. Therefore, the Commission changed the guifeline table to a basic standard in the body of the regulation.

FISCAL IMPACT STATEMENT

Regarding the Adoption of Non-substantive Corrections and Clarifications for the Basic Regulations and Corrections to the Numeric Standards for the San Juan and Dolores, Gunnison and Lower Dolores, Rio Grande, and the South Platte River Basins.

In accordance with section 24-4-103(8)(d) the Commission finds that the corrections and clarifications to its current regulations numbered respectively, 3.1.0, 3.4.0, 3.5.0, 3.6.0, and 3.8.0, have no fiscal impact.

PARTIES TO PROCEEDINGS

1. Climax Molybdenum Corporation
2. Trout Unlimited
3. Colorado Municipal League
4. City of Loveland
5. Eastman Kodak Company

Mr. ROE. Our next witness is Mr. Wilson Fisher, representing the Hess & Fisher Engineers, Inc., Mining and Reclamation Council in Clearfield, Pa., accompanied by Mr. Al Whitehouse of Buffalo Coal Co. in Bayard, W. Va.

We welcome you and I guess Mr. Fisher will give his statement.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT ON BEHALF OF THE MINING AND RECLAMATION COUNCIL AND THE PENNSYLVANIA COAL MINING ASSOCIATION, WILSON FISHER, PRESIDENT, HESS & FISHER, ENGINEERS, CLEARFIELD, PA., ALFRED E. WHITEHOUSE, ENVIRONMENTAL ENGINEER, BUFFALO COAL CO., BAYARD, W. VA.

INTRODUCTION

The following statement is submitted on behalf of the Mining and Reclamation Council, whose member companies produce approximately 70 percent of the Nation's coal, and the Pennsylvania Coal Mining Association consisting of over 160 coal companies.

The coal industry has made tremendous strides in improving reclamation technology and abating previous mining problems by re-mining previously mined areas while assisting the national interest of energy independence. However, impediments to this effort are many—some of which take their origin in the Clean Water Act. The following statement, besides addressing issues of general concern with the Act, speak to some of these prohibitions.

BPT/BCT

The application of BPT control technology and standards by the mining industry has been shown to effectively control the conventional pollutants that are recognized as being part of the mining process. We feel that the requirement of BCT by July 1, 1984 would not achieve significant water quality improvements in proportion to the magnitude of the capital investment.

The technological innovations and advancements, envisioned by the Clean Water Act, have not developed as rapidly as the mining industry or government would like. As a consequence, we're utilizing the same technology today, only with refinements on the theme, that we were using at the time of the passage of the Act and before. The implications of the continuance of this level of technology and the perpetuation of it, is an issue that has not been fully debated nor addressed. The addition of alkaline materials to acid water outfalls introduces other components into the discharge stream which, from the standpoint of many, is as dilatorius to the receiving waters and indeed in many instances inharmonious with the character of the receiving waters than if the mine drainage discharge had been left untreated or treated in some more expeditent fashion. However, the compulsion of compliance with BCT by July 1, 1984 is upon us. It is the firm resolution of the mining industry that the implementation of BCT at this point in time would be inconsistent with the objectives of the Act and would present a burdensome economic yoke around the mining industry's neck at a time when the coal mining industry is confronted with the most severe market depression in over twenty-five years. The net result of such requirements would indeed result in marginal mining operations failing, producing greater unemployment in the coal fields and would not achieve sound and reasoned environmental objectives.

A modification of the deadline for compliance with BCT is appropriate. BCT, however, if implemented, must be under the constraints of cost reasonable and cost effective.

DREDGE ON FILL PERMITS

Section 404 still compels a multiple agency permit overview for dredge and fill and wetlands. Although the Corps of Engineers has the primary responsibility, the Environmental Protection Agency has strong permit overview requirements including veto power. Industry has been throttled by the maze of red tape and inherent delays when being bounced between various agencies. The Corps of Engineers has the experience, the manpower and the where-with-all to see the permitting requirements are appropriate and they can maintain an overview of the project. Other

agencies may recommend, within a set time frame, to the Corps their thoughts, feelings, concerns and suggestions relative to the permit application, but this redundancy of review and authority, which is all too characteristic of environmental law, has got to stop. Industry is being throttled by its, economics of various projects are skyrocketing and productivity is diminished as a consequence of these delays.

Wetlands, especially those in the upland areas have been perceived as sacrosanct by the enforcers of the Act. It's important to note that under various experimental and overview projects, mining can be harmonious with wetlands. Experimental programs are presently on-going to prove that wetlands can be mined and reconstructed to serve their original ecological purposes. The mining industry has the technology and the ability to accomplish this task while extracting and producing the coal reserves so necessary to maintain our energy independence.

NAVIGABLE WATERS

We recommend that the definition of navigable waters exclude intermittent and ephemeral waterways. The definition in the Act of navigable waters as "waters of the United States, including the territorial seas" is so broad that it encumbers. The mining industry has problems with the current definition; in that, the force of the Act prohibits the preparation of mining plans and control technology for mining through intermittent and ephemeral waterways. We have the technological capability and the equipment necessary to mine through these waterways and to reconstruct them so that they may serve their intended function in the post-mine stage.

EFFLUENT LIMITS

We have found that the EPA derived effluent limits for water quality have been, at times, significantly incompatible with the natural characteristics of the receiving water and that these effluent limits fail to take into consideration the water quality baseline condition. Promulgated effluent standards must be flexible so as to provide a range of limits which are sensitive to natural background conditions and protects the present use. Indeed, in some instances, the effluent limits assigned are incompatible with the tolerance levels of established aquatic life within the stream. For instance, mildly acid streams, a commonplace in Appalachia, with established aquatic biota, cannot readily stand substantial effluents of high level pH and alkalinity as mandated by the pH effluent limits. Additionally, the reduced loading of the suspended and/or settleable solids as required for erosion control from mine sites are incompatible with the natural sediment productive capacity of the premine area, and the sediment carrying capacity of the streams, which can create additional erosion downstream.

Another example of treated water discharges being disharmonious with receiving waters, is the instance in which higher level pH's are required to precipitate dissolved iron. These chemical conditions in the discharge will also precipitate the naturally occurring aluminum and manganese in the receiving water. The regulations compel increases in pH but not decreases to natural levels i.e., 5.0–5.5, as frequently occurs.

EPA is currently attempting to respond to the seasonal variability of water quality characteristics and tailoring their effluent limit criteria, in cooperation with the State regulatory agencies, to allow for minimum and maximum effluent limit controls as would be more consistent with natural hydrologic cycle variability. We support this effort. It represents an advancement in regulatory perspective that will allow greater flexibility for industry and is consistent with good evironmental control.

As an example of regulatory requirements which are not well reasoned, it is important to note that the analytical requirement for the determination and the assignment of effluent limits for iron and manganese, neither of which have been identified as possessing health related concentration levels, has been assigned to be determined by the total analytical determination method. This measure combines the concentration of that which is physically suspended and present within clay particles and other mineral components that are carried along as part of the suspended portion of the discharge, as well as, that which is chemically dissolved. It would appear that the intention should have been to establish a dissolved element determination for each of these two chemical components instead of a total determination. The dissolved element measurement would ascertain the concentration of the element which would be carried by the waters some distance; whereas, the physically dispersed or suspended part of the fraction of these elements will settle out in response to gravity over a shorter distance.

NPDES PERMITS

The NPDES permit should have a life of ten years. Performance criteria specified by the permit would not change during the life of the permit. This life span would allow industry an opportunity to plan, design and invest in complex control technology and to amortize the capital investment of that control technology.

The states that have the regulatory staff capability of reviewing site specific conditions, need the latitude of going beyond technology-based effluent limitation guidelines for the protection of natural conditions and the utility of industry. Reference should be made to the discussion on effluent limits.

ATTORNEY AND EXPERT WITNESS FEES

Section 10(3) of S. 431 deals with the awarding of fees for attorneys and expert witnesses, in instances, in which they are involved in litigation against either the actions of the regulatory agency and/or industry. There are established avenues for objection and redress from decisions made by the regulatory agencies for aggrieved parties through both administrative and judicial channels. It is imperative that the administration and our government agencies not provide limited public monies as a stimulus for obstructionism.

STREAM USE DESIGNATION

We've had considerable difficulty with State regulatory agencies efforts in establishing stream designation uses, and the subsequent water quality criteria for those designated stream uses. There have been instances in which either segments of streams or entire streams were inappropriately classified. The classification was done in the context of a "best case, what if" scenario, i.e., if all pre-law abandoned mining activity were reclaimed and consequently had no detrimental affect upon the stream, then the highes designated stream use in such a wishful perspective would be achieved.

The mining industry urges a more reasoned stream use designation which is based upon baseline, water quality determinations and historical use so as to provide a clearly defined system for permitting for the industry. Technical and economic criteria, as well as, environmental considerations can be formulated so as to be part of a mutually consistent and compatible basis for user designation.

The designated use provision proposed in Section 6 of S. 431 is not in the best interest of the mining industry or that of the states water quality programs. It precludes state flexibility in analyzing and reviewing the basis for their waterways. Additionally, it would tend to perpetuate the inappropriate classification problem cited above.

GOALS

Relative to Title I of the Act, we find that the goals expressed in Title I, specifically zero discharge of all pollutants into the navigable waters by 1985, and the second goal, albeit interim, of, where attainable, fishable, swimable water quality by July 1, 1983, are not economically viable nor necessarily philosophically compatible with the apparent language of the Act. For example, it would appear that some of the historical language states that the philosophy of the Act is to prevent destruction of the nation's water's capacity to clean itself; thereby, recognizing the fact that the water systems of the country have a natural capability of self regeneration. The goals then, appear to not compel water to be restored by industry to its original condition, but indeed to achieve a desirable level of quality. For instance, if a certain stream can fulfill a designated use, i.e., drinking, swimming, or recreation, etc.; then, the capacity of the stream available for use by industry, is capable of being determined. This fraction becomes significant, in that, the water may then contain a certain level of pollutants.

Additionally, "zero discharge" for conventional pollutants forces alternatives to discharge treatment such as: land application, deep well injection and ocean dumping, as well as, waste regeneration and recycling. Commendable as zero discharge sounds, the economics of compliance, at this point in time, are the fundamental technological limits which inhibit compliance. Advances in both measurement and control technology and, indeed, the prohibitive cost of going to the ultimate degree for new control technology appears promising but is not proven.

The mining industry supports retention of zero discharge for toxic pollutants.

FEDERAL COMMON LAW

Problem: In *City of Milwaukee* vs. *Illinois*, 451 U.S. 304 (1981) the Supreme Court held that the Congress, in enacting a comprehensive regulatory program, supervised by an expert administrative agency, precluded the ability of an individual through the application of nuisance concepts to bring a federal common law action for activity regulated under the provisions of the Act. The court specifically found that a party affected by the decision of a permit granting agency is provided ample opportunity under the Act's provisions to seek redress.

In its decision the Court stated:

"It would be quite inconsistent with this scheme if federal courts were in effect to 'write their own ticket' under the guise of federal common law after permits have already been issued and permittees have been planning and operating in reliance on them."

This decision of the Court is grounded in the fundamental principles of federalism as well as sound practical considerations. Federal authority should be exercised through statutes enacted by Congress and administered by federal agencies. The courts are not better suited than the Congress to develop national policy in areas where the Congress has enacted comprehensive legislation.

In current discussions surrounding amendments to the Clean Water Act, various groups are seeking (1) a legislative repeal of these decisions and (2) the creation of a new right of action in the Federal Courts. Adoption of such an amendment would inject an unacceptable degree of uncertainty as to federal standards of conduct and remedies and thwart the Congressional intent of providing for orderly pollution abatement and a fixed period for permits issued under the Act's NPDES system.

The legal and practical significance of this permit program would be in grave doubt, however, if a permittee could be subject to a suit in federal court not on the ground that the permittee was out of compliance with its permit, but rather that a complying discharge constitutes a common law nuisance, such undefined liability could lead to chaos. As the Supreme Court noted in *Milwaukee*, "(t)here are no fixed rules that govern; these will be equity suits in which the informed judgement of the chancellor will largely govern." Such actions would tend to render the permit process meaningless and require the courts to second-guess administrative determinations in a manner that could not have been anticipated.

In enacting the Clean Water Act, Congress set forth a comprehensive scheme requiring that dischargers meet detailed requirements including the attainment of technology-based effluent limitations and the achievement of water quality standards. The Supreme Court's decision in the *Milwaukee* case limited the authority of federal courts to develop common law in this area. The decision in effect requires the courts to defer to the permit agencies as to discharges regulated by the Act. Proposed amendments would repeal that decision and would subject those who are in full compliance with all Clean Water Act requirements to additional, undefined federal liabilities. Establishing additional remedies, as proposed, would inject chaos in the federal water pollution control program and frustrate the intent of the Act.

Recommendation: Amendments to legislatively repeal the *City of Milwaukee* vs. *Illinois* decision and create a new right of federal action should be rejected.

Mr. ROE. Please proceed.

TESTIMONY OF WILSON FISHER, HESS AND FISHER ENGINEERS, INC., CLEARFIELD, PA., AND CHAIRMAN, MRC'S WATER QUALITY SUBCOMMITTEE, ACCOMPANIED BY AL WHITEHOUSE, BUFFALO COAL CO., BAYARD, W. VA.

Mr. FISHER. Yes, sir.

Mr. ROE. You may go ahead.

Mr. FISHER. It is good to see you again, Mr. Chairman, Congressmen.

I am Wilson Fisher, as was stated, chairman of the Water Quality Subcommittee of the Mine and Reclamation Council. I'm also speaking on behalf of the Pennsylvania Coal Mining Association today, of which I'm technical committee chairman.

Mr. Whitehouse is an environmental engineer with the Buffalo Coal Co. from West Virginia and will be speaking on certain elements of our testimony today.

We would like to briefly brush over the preprepared text but we will highlight parts thereof.

Mr. Chairman, I wish to emphasize that the mining industry is very supportive of the Clean Water Act and its philosophical objectives. However, there are certain areas in which improvements can be made. Obviously, Mr. Chairman you have embraced a number of changes too.

I. It is our position to support the extension of the NPDES permit life to 10 years. As we addressed this item in the past, this extension gives us the opportunity to amortize our capital equipment costs. The extension will also provide for a more efficient permit review process.

Mr. ROE. You made the point that one good reason to extend to the 10 years is because it gives you a longer period to write off any equipment investment. That is a very important one. That is the first time it has come up.

Mr. FISHER. Yes, sir.

II. We are opposed to freezing stream use designations, sir, at any point in time. We feel that, as several other gentlemen have addressed prior to us, that user designations were done in haste. They were done without good technical justification and in many instances that we have personally encountered the designations were done without proper consideration to the use characteristics of the receiving waters.

III. We support the concept of technology based effluent standards for discharges into low flow, ephemeral and intermittent streams. We feel that the States should have the flexibility to address these cases and that discharges should not be prohibited into low flow, ephemeral and intermittent streams.

Mr. ROE. Why don't you elucidate on that a little bit. We understand what the issue is. It is OK to have a stream that is flowing for 6 months or 10 months out of the year and the other 2 months it is not.

Mr. FISHER. The prohibitions that stem from the act, limit the quality of the discharge or prohibit it entirely, even when the discharge is in compliance with the prescribed effluent limits. Let me clarify; if, for example, a receiving stream's flow may go from 1,000 gallons a minute, at one point in time, to 100 gallons per minute during a drought, the permit requirements limit the discharge into the stream to some fractional percentage—usually one-sixth—of the total flow of the receiving stream goes dry no discharge is being allowed.

Mr. ROE. Do you have to pool that material and store it?

Mr. FISHER. We have to pool it, shut down our mining operations, or divert it to other receiving streams, by pumping through multistage pumps to another watershed, which may have a larger flow or a perennial stream flow.

The logic being used by the regulatory agencies is: They do not want to risk exceeding the assimulative capacity of that receiving stream when technology based effluent limits are permitted for the discharge.

Mr. ROE. But if you could be discharging to that stream during a particular period, it could be of a quality that could not necessarily hurt it.

Mr. FISHER. Precisely, sir. That is the point.

IV. We would like to see the BAT deadline period extended to 3 years from the effective date of the BAT regulations for the industrial classification.

V. We would also like to see the Corps of Engineers assigned exclusive regulatory responsibility for section 404 of the program. The confusion and redundancy inherent with multiagency reviews is sufficient basis to streamline this area. By giving exclusive permit review and regulatory authority to the corps, we feel there would be a more efficient, more effective program element.

VI. We feel the Clean Water Act is not the appropriate vehicle for regulation of upland wetlands. There has been, we understand, pending legislation to address that particular type of wetland. We are currently attempting to participate in that process.

VII. We oppose legislative repeal or efforts to legislatively repeal the decision of the U.S. Court in the case of *Milwaukee* v. *Illinois*. We feel the administrative process should not be circumvented.

VIII. We would like to recommend the exclusion of upland wetlands, intermittant streams and ephemeral streams from the definition of navigable waterways.

IX. We embrace philosophically the goals of zero discharge and fishable, swimmable objectives. However, in the context of reality, cost effectiveness and the historical basis upon which the rest of the act was developed, we feel that absolute adherence of zero discharge and fishable/swimmable objectives as a must by regulatory agencies is thwarting the growth of industry and inhibiting job development.

X. We are also, sir, opposed to legal fees except for prevailing or substantially prevailing parties. We have encountered increasing instances of obstructionism in the permitting process. Legal obstructionism encouraged by tax paid fees in instances in which the fee is justified by the mere change of any part of the permit no matter how minor, is inconceivable, yet an increasing reality for industry.

Now, sir, I would like to talk about a particular area of concern and interest to both the Mining Reclamation Council, the Pennsylvania Coal Mining Association and myself for some number of years. It is an issue dealing with the vast scope and extent of the abandoned mined lands that we have in our coal producing areas.

In Pennsylvania, we have approximately 250,000 acres of abandoned mine lands. The State of West Virginia has over 100,000 acres. Nationally we have well in excess of 1 million acres of abandoned mine lands that have not achieved the degree of reclamation success that is presently required by the Federal Surface Mining and Reclamation Act, as well as, the State regulatory agencies' regulations.

Note that these abandoned mine lands were partially reclaimed or were not reclaimed in compliance with the existing laws or lack thereof.

Most of these lands contain additional coal reserve that can be mined at a profit but many of these sites have preexisting mine discharges due to earlier mining activities. Indeed earlier regulation encouraged discharges for safety reasons. Remining these sites

now becomes prohibitive as a result of the assignment of permanent water treatment liability to the current mining operation.

As an illustration of the negative impact of these statutory-regulatory requirements I would like to refer back to my State of Pennsylvania again. In 1966, we had approximately 3,200 miles of streams that were affected by acid mine drainage to the extent that they were nonfishable. In 1978 that number had been reduced to approximately 2,300 miles. This improvement was achieved by virtue of a cooperative effort between the regulatory agency in our State and the coal industry.

The prohibitive element appears to stem from the as we see it, regulations written by EPA as compelled by the Clean Water Act.

The legal interpretation of these regulations has been passed by EPA to the Federal Office of Surface Mining and from them to the State regulatory agencies. This prohibition assigns a permanent water treatment liability—to effluent limits—to the current mining operating company for all preexisting discharges encountered when remining a previously mined area. As ironic as this is, and as improper as it appears, this is indeed a fact of reality that we are dealing with now.

Time is running out in certain mining areas. In my home county of Clearfield in Pennsylvania, we have 20,000 to 30,000 acres of abandoned mine lands. The vast majority of these lands could be remined, recontoured, revegetated—to current standards—at no cost to the taxpayer, and the discharges of acid mine drainage minimized. But our nonpreviously mined coal reserve is dwindling. Our remaining mining industry will probably be comparatively small by the turn of the century. Consequently, the capital equipment, skilled manpower and management resources necessary to accomplish this task will be gone from the area. If any reclamation is to be done at all at that time, it will be at the expense of the taxpayer. We would not like to see that tax expenditure come about.

We respectfully recommend, although we have not drafted specific language, amendment of the act as the means of overcoming this obstacle.

At this point, sir, I would like to defer to my colleague, Mr. Whitehouse, to comment upon effluent limits and some research that he is doing.

Mr. ROE. Mr. Whitehouse.

Mr. WHITEHOUSE. Thank you very much.

Today I would really like to describe some field situations that we face on a daily basis.

One, to reemphasize, is the problem with the stream use designation. The States that I deal with, West Virginia and Maryland, took the approach that would assign the highest use and then put the burden on the applicant for a permit to show that in fact the use was unattainable, and at that time, the State would reconsider the classification and allow different effluent limitation suitable to the new classification.

Now, I don't feel that this is necessarily a bad way to approach stream designation unless there is a move to put on a freeze as of some date. We have then created an artificial situation which the State who applied the origional standard never envisioned would

happen. The States were looking for someone else to pay for the necessary field research to determine what the quality of the stream was.

So if it is, in fact, your intention to include some type of a freeze, which we are against in its own right, we would certainly urge you to allow some additional time and appropiate some money to the States to allow them to do the necessary biological research to test for fisheries and to determine whether or not fisheries ever did exist and properly classify each stream.

This brings me to my second point, which concerns the effluent limit for pH. The streams in Appalachia are naturally acidic and the water there is much like it is in the pine Barrens, a tea-colored humic acid water. The pH generally ranges from 4 to 6 and rarely is a stream between 6 and 9.

The State flower of West Virginia, the rhododendron is a plant which requires on acidic environment.

Mr. ROE. You are speaking in its natural state?

Mr. WHITEHOUSE. Yes, sir, absolutely unaffected from any mine.

The industry has amassed a vast collection of stream baseline data for permitting so this is becoming a pretty good base of before-mining data and it supports the very low pH. Now, we are not talking about streams that are polluted. We are talking about streams that just have a low pH.

One instance which disturbs me, but it has certainly been useful in proving the point, is a mining operation we have upstream of a headwater wetland which happens to be a bog. A bog is typically very acidic and thrives in sub-5 pH conditions. Our effluent, which ranged between 6 to 9 pH was discharged through a manmade channel which did not exist prior to mining, into the natural drainway which went through the bog. This dischange, in fact, killed a fair portion of the bog. The plants were just not able to tolerate these high levels of pH.

So now we are looking at this situation and trying to figure out what is happening floristically in the bog. We are finding a completely new set of species which are tolerant of alkaline conditions beginning to repopulate this area that was once populated by species very tolerant of acid.

So what we have is one element of the Clean Water Act, in fact, doing damage to a wetland, an ecosystem of concern to another element of the Clean Water Act.

I would like to add one other note of what I feel is some good news. I am involved with some friends at West Virginia University in some research on the ability of a bog to treat acid mine drainage. We have approximately 4 years of data and it is very, very promising. So we have a natural system to clean up a problem which certainly has plagued the mining industry since its inception.

I won't testify that this will be a universal cure and, in fact, work in all cases, but it does work in some applications. But we never will be able to meet the pH effluent limits as they currently exist.

Mr. ROE. In the regulations?

Mr. WHITEHOUSE. Yes, sir. What we would like to suggest is that the committee recommend to EPA that it reevaluate its position on

pH and allow these acidic systems to be maintained in their natural condition and not require the mining industry to treat natural ground water, which in many cases we treat. When we excavate a pond for sediment control, it fills up with spring water or ground water and ultimately discharges. The pH hovers in the neighborhood of five, so we are one point below effluent limit. We are then required to add a chemical treatment which is often counter-productive and in some instances, we actually kill a natural ecosystem.

So we would certainly urge that you recommend to EPA that they reconsider.

Also, I would like to support the provision to exclude storm water runoff from the effluent limitations precisely for the same reason. Many of the surface mining operations find it necessary to dig a diversion ditch around the upper limits of the permit area in order to keep water above you in the drainage from passing through the sediment structures. This eliminates contamination and treatment of the unnecessary water flows.

So we would certainly urge you to consider that in addition to the legislation.

I thank you, sir.

Mr. ROE. Are there any questions from the gentlemen?

Mr. CLINGER. Mr. Chairman, first of all, I would like to welcome Mr. Fisher, who happens to be a constituent of mine.

I am delighted to have you back before the committee, Mr. Fisher, and also Mr. Whitehouse. I think your testimony has been very helpful to the committee.

Just a couple of questions. We had a number of witnesses testify this morning about the problems that would arise with freezing the use designation. But again, I think it would be extremely helpful if we could have some specific examples of why that would be or specific examples of streams or water uses where that would be a problem of wrong designations, for example.

I think one of you suggested many designations were made at the highest use, which really are unrealistic. Therefore, to freeze those in place at this point would be counterproductive. One example was in Puerto Rico where all streams are designated as drinking water use, which is just unrealistic.

So it would be very helpful if we had some examples, specific examples of why that would not be a good idea to freeze the use designation at this point.

Mr. FISHER. We would be more than pleased to provide some documentation on that, sir.

In fact, let me add that I am currently dealing with a permitting problem that addresses that singular issue. The permit has fulfilled all of the technical details necessary for issuance after an exhaustive review by our regulatory authority for mining, except for the problem that, the receiving stream is designated high quality. Unfortunately, the water quality characteristics of that particular stream are anything but high quality. It had been previously deteriorated by prelaw mining operations. Yet, we are at an impasse as a result of the inposed multiagency review process within our State system. I am confident that we will prevail. Logic would have us prevail. But the time element has pushed the permit application

well into its second year. Unfortunately, these unreasonable delays have resulted in layoffs in the mining company.

Mr. CLINGER. Mr. Fisher, you also alluded to the problem of the abandoned mine situation and the problems that you are encountering. I am certainly familiar with the problems of Clearfield County.

We have a lot of serious situations that really do need to be addressed. What can we do in this legislation to alleviate that problem?

You did address it, but could you give us some specific guidance of how we can alleviate that?

Mr. FISHER. It is my personal opinion and that of the committees that I represent, that the appropriate vehicle is indeed, an amendment to the act with language which specifically addresses the obstacles to remining abandoned mine areas. I would also seek the committees thoughts in this regard.

Mr. CLINGER. And those specific obstacles, could you enumerate?

Mr. FISHER. The issue of permanent water treatment liability for preexisting mine discharges which become assigned to mine operators when they remine an area.

Mr. CLINGER. Where you go in to an area that has been mined and you are remining it and you are willing to assume the responsibility for reclaiming that whole area by conclusion of the mining operation.

The problem is that you are held with a very high degree of discharges?

Mr. FISHER. Yes, sir. In fact, legal staff within our State regulatory agency and within the EPA have apparently concluded that the liability continues into perpetuity for the present day mine operator for that preexisting discharge.

Mr. CLINGER. So that is a tremendous disincentive for any mine operator to go into an abandoned site?

Mr. FISHER. Precisely.

Mr. WHITEHOUSE. Sir, if I could add one other item. It seems that when Federal funds are used to reclaim an abandoned mine under the OSM abandoned mine lands program that liability is not assessed. So if, in fact, reclamation is not 100 percent successful in restoring water quality to effluent limits, the water treatment liability is not assessed to the person who does the work because it was a Federal project to reclaim the site on a contractual basis. What we are saying is, we will not go in and only reclaim. We would actually remine and take additional reserves. This oftentimes will limit the effluent in quantity further than by only backfilling.

We are certainly extremely hesitant to risk accepting water quality liabilities where we will be saddled with treatment for life.

Mr. FISHER. The legal trigger mechanism seems to be the distinction between remining, in which coal is extracted, versus reclamation in which only reclamation is done.

Mr. CLINGER. The question I would have and you might want to provide this for the record, as far as we know there is nothing in the Clean Water Act that would impose that kind of liability and I am wondering if it comes through the Mining Reclamation Act or

some other legislation that this is imposed, the Superfund perhaps or where is the hook for this liability?

Mr. WHITEHOUSE. Under the Surface Mine Act we are required to embrace a mining operation with complete perimeter control and those generally are ditches and they collect any water which comes from the job or rains onto the job and then that is conveyed to a sediment pond or ponds and then that discharge is your point source at which you then meet effluent limitations.

In the act of remining, it is almost a certainty that the effluent or the water coming from the job is going to be intercepted and now you have it in your pond and that is where you get stuck.

Mr. PACKARD. Would the gentleman yield for a moment on that?

Who now has the responsibility and liability on abandoned mines that are not reclaimed?

Mr. WHITEHOUSE. No one.

Mr. ROE. If a mine is abandoned, obviously the title of the land has to remain someplace. Does it still repose in the original owners or does it revert to the State?

Mr. WHITEHOUSE. Well, no. The property owner oftentimes does not lose title to his land. In the case of my company we own very little land and we generally lease land.

So the owner of the land still retains his title. We are talking about abandoned preact, and pre a lot of things.

Mr. PACKARD. But if a company comes in and concludes the mining operation is no longer profitable and they abandon the activity, it would appear that there could be some legal recourse for the property owner to be left saddled with a major pollution problem or quality problem.

Mr. FISHER. You have a good point there, sir. If this were to occur today, the mining operator has the responsibility and the liability. There is no ifs, ands or buts about that.

We are talking about prelaw mining. There were no grandfathering provisions for the assignment of liability when present mining law was enacted. As a consequence, there is and has been no effort to assign liability for these old, preexisting discharges.

Mr. PACKARD. And if I understand your answer to Mr. Clinger on reinstituting mining operations or suggesting that the new operator does not inherit the water quality problems of the previous operator or the landowner?

Mr. FISHER. Precisely, sir.

Mr. RAHALL. Will the gentleman yield?

If I am correct, a great deal of that responsibility falls under the Surface Control and Reclamation Mining Act of 1977, does it not?

Mr. WHITEHOUSE. The water quality standards are directly fixed to the Clean Water Act.

Mr. RAHALL. I know that we have had oversight hearings on the 1977 surface mining law, the responsibility that is imposed upon an operator that comes in and mines what remaining coal there is on an abandoned site, and the responsibility he incurs have been a major point of consideration in what changes we might make.

Mr. CLINGER. That is part of the Surface Mining Act because under the Clean Water Act your responsibility is limited by the extent of your permit. As long as we are operating under the permit, we have certain responsibilities and liabilities, but once the

permit is expired they will go on into perpetuity under the Clean Water Act?

Mr. FISHER. That is right.

Mr. CLINGER. Well, gentlemen, I thank you both. It is good to see you, Professor. I appreciate your testimony.

Mr. ROE. Are there any further questions?

Mr. MOODY. I particularly appreciate your reference to Milwaukee. That is very important although these attempts that you cite to legislatively roll that back would not probably affect us.

I think we have had a problem. The last thing we need is the open sesame system where anybody can take anybody to court irrespective of the Clean Water Act processes that are very specifically laid down.

This is a very important part of our testimony. From our experience we have learned what you say is true in spades.

Mr. FISHER. That is true and we hope the members of the committee would share our fear.

Mr. ROE. If you are suggesting language, would you give us your thoughts?

Mr. MOODY. You are just resisting the amendment?

The judge in the Supreme Court has held that the law was thorough and complete in this area and that we did not want to throw it open to common law nuisance suits, so we throw the whole ball game up in the air again and you would urge that we resist amendments to open that up.

Mr. FISHER. Yes, sir.

Mr. WHITEHOUSE. We looked at a permit as some bit of protection. We hoped the system would protect us as long as we meet the requirements. If you opened it up, the permit is no longer protection. You have no protection at all against some truly outrageous suits.

Mr. ROE. Any further questions?

Mr. RAHALL. Yes. I know you have discussed the freeze on stream designations in your testimony and also in response to the gentleman from Pennsylvania's question and you are relating to us the impact that would have and it has been very interesting.

You also said that if such a stream freeze designation is enacted as called for in our distinguished chairman's bill, which I am glad that he is here at this time, you said that additional time and money would be needed.

Would you elaborate on that and what additional time you are talking about and what additional money?

Mr. WHITEHOUSE. Yes, sir. In the State of West Virginia and the State of Maryland, and I am sure other States, very little has been done in the headwater areas of streams which is where most of our mining operations take place.

Before you could classify a stream as a class 3 trout water, for example, which gets pretty high use, you should have to, in fact, make a biological check with the stream to make sure that the trout, in fact, exist and that the necessary life support organisms are there.

West Virginia, unfortunately, has a very low number of streams which are actually natural trout fisheries. This is partly based on the generally acidic nature of the waters. The streams will support

a stocked trout and they will survive for a season or so but in water with very low pH, they are unable to breed and reproduce. So it would be extremely unfair to consider these as natural trout waters when, in fact, they are now and never were due to the suppressed pH.

I think for Mr. Clinger's benefit an example is that West Virginia has done a little more work in the north branch of the Potomac area than they have in Maryland, and the feeder stream to the north branch of the Potomac on the Maryland side are all class 3 trout waters.

The West Virginia side where actual work has been done in some streams almost none are class 3 natural trout waters and I certainly contend the only difference between one side of the river and the other is the State boundary.

The habitats and ecosystems are identical. So this is the problem and I am sure the States don't have sufficient funding and manpower in their own resources to do the job in the amount of time that I am sure you folks would like the job done in.

Mr. FISHER. I think that speaks to the heart of the problem that the State agencies deal with. They have fairly limited modeling techniques based upon very few and limited point evaluations, that do not give them the full handle on the total characteristics of those streams over their entire length.

The problem then occurs when the regulatory agencies perceive the designation as rigid. This rigidity tremendously inhibits our industrial efforts.

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. ROE. Fine. Thank you. No further questions.

Thank you very much for being here and thank you for your testimony.

Our next witness is Mr. John Hart, accompanied by Mr. Nick Ciccarello, Jr., executive director of the West Virginia Utility Contractors Association. You are representing the West Virginia Utility Contractors Association and the West Virginia Society of Professional Engineers.

We offer you an official welcome from Mr. Rahall from West Virginia.

Mr. RAHALL. I thank the gentleman for yielding to me to present to the subcommittee this morning the West Virginia Utility Contractors Association and the West Virginia Society of Professional Engineers. It is indeed an honor to have these two groups present their views to the Congress today on the Clean Water Act and, in particular, the construction grants program.

Mr. Chairman, as you realize, back in 1981, when Congress reauthorized the construction grants program, we had to make some drastic changes in order to obtain the President's signature. Two of those changes, the reduction in the Federal share for each sewer project and the almost total removal of grant eligibility for collector lines, will make it very difficult for many of our communities to achieve the goals that we outlined in the Clean Water Act.

Our State has very severe unemployment problems. We have led the Nation in unemployment for many months now and it is doubtful that West Virginia's economy will completely rebound in the very near future.

These economic problems have brought about a dramatic drain of resources available at the local level for sewer projects.

Here today to share with our subcommittee the problems that West Virginia will face as a result of those changes in the construction program are Mr. Nick Ciccarello, executive director of the West Virginia Utility Contractors Association, and Mr. John Hart, member of the West Virginia Society of Professional Engineers.

I have worked closely with these individuals during my tenure in the Congress. They represent very fine organizations and they have provided West Virginians with not only proper sewage treatment facilities but with employment that we so drastically seek more of in today's economic climate.

I am very honored to present them to the subcommittee.

Mr. ROE. Very fine.

TESTIMONY OF JOHN R. HART, MEMBER, WEST VIRGINIA UTILITY CONTRACTORS ASSOCIATION AND WEST VIRGINIA SOCIETY OF PROFESSIONAL ENGINEERS, ACCOMPANIED BY NICK CICCARELLO, JR., EXECUTIVE DIRECTOR, WEST VIRGINIA UTILITY CONTRACTORS ASSOCIATION

Mr. HART. Thank you, Congressman.

Mr. Chairman, members of the committee, I am John Hart, a professional engineer and president of BCM/Milam Engineering Co., in Charleston. This is Nick Ciccarello, who is executive director of our association.

It is with a sense of serious concern that we appear before this committee representing the West Virginia Society of Professional Engineers and the West Virginia Utility Contractors Association. Our members in both organizations have worked on all phases of the EPA construction grants program and have first-hand experience on how the program is functioning.

Public Law 92-500 is of immediate concern not only to our members and the thousands of workers they employ, but also to 62 percent of the West Virginia population currently not serviced by sanitary sewers and clean water.

I would like to direct our concern to recent congressional policies that reduces EPA funding from 75 to 55 percent and the deletion of collection systems in their entirety. Collection sewers are an integral part of any treatment facility and as such should not be separated.

By eliminating collector sewer funding and reducing other sewer funding, it will only lead to trouble. Public Law 92-500 has proven to be, for the most part, a cost effective, environmentally sound and, economically achievable solution to our wastewater problem. Without collector sewers, the program would become an administrative nightmare and the clean water effort in West Virginia would suffer a severe setback.

State officials have indicated that such a policy would certainly lead to municipal funding problems and 98 percent of all the treatment projects planned in West Virginia would never reach completion. In short, gentlemen, we would drown in our own sewage.

Three issues are of particular concern: One, environmental and health problems which would arise; two, noncost-effective solutions

which would be promoted; three, the economic burden which would be placed on municipalities.

Elimination of collector systems from Federal funding eligibility would result in environmental problems. In West Virginia, many ground water problems have been caused by septic tank contamination. In several areas of West Virginia, septic tank contamination has closed down a series of public water supply wells due to high fecal coliform levels.

Survey after survey indicates that small communities, if faced with the choice between building a complete collector sewer treatment plant system and their current septic tank system, would choose to remain with the more inexpensive septic tank alternative.

Another groundwater contamination problem is caused by leaking, old collection sewer lines. Rehabilitation of these lines not only lowers the infiltration/inflow of wastewater, but also lowers the corresponding pollutant loadings on the treatment facility. Elimination of this type of Federal funding would be a great mistake.

In many municipalities in West Virginia, the infiltration inflow problem is so great that a cost-effective solution to the treatment needs of the community is impossible without first rehabilitating these lines.

Surface water problems can also continue to occur as a result of using collector sewer treatment plant alternatives. Package plants have been an alternative in many communities. In West Virginia, more than 2,000 such package units exist. These small plants have a history of poor maintenance, operation, and location.

The clean water effort by the EPA construction grants program in West Virginia has been slowed down due to municipal funding problems. Although communities need to contribute only 25 percent of eligible project costs, their small size makes funding hard to come by. In Shady Springs, W. Va., a wastewater project was delayed for 124 months while waiting for the local share.

If collector sewers are not funded and if the Federal share of treatment is reduced to 55 percent, the local share of a project in West Virginia will be approximately 85 to 90 percent of the project cost, while the Federal share would decrease to approximately 10 to 15 percent.

Over 98 percent of the projects in the State would be dropped for municipal funding problems alone. If local governments have difficulty in funding projects now, they surely will find it close to impossible to fund almost four times as much money.

For the 220 municipalities in the State which have collection treatment systems, what you gentlemen decide will have no bearing. However, the other 98 municipalities, some 56 percent of the State population, will be forced to remain on environmentally unsound solutions such as septic tanks, holding tanks, and our rivers and streams.

In conclusion, the construction grants program has taken years to get on track. Regulations and guidance memos have been promulgated and refined to incorporate solutions to problems that have arisen from past experience.

The priority system of arranging projects is a good one with checks and balances between the regional EPA and State levels.

The States draft a priority list based upon an intimate knowledge of the State's water and sewer problems.

Should this system or funding levels be changed, administrative problems would surely occur. West Virginia officials, which administer the program, have stated that 98 percent of the projects would be dropped if funding is reduced and collectors are eliminated, making the clean water program in West Virginia an administrative nightmare. It would take the program years to get back on track to a point where it is today.

Should we change collector sewer funding eligibility, problems would be created. We would allow the current unacceptable wastewater solution of septic tanks, holding tanks, and the continued pollution of our rivers and streams. The many ground water as well as surface water contamination problems that we are now experiencing in West Virginia will continue.

The West Virginia Society of Professional Engineers and the West Virginia Utility Contractors Association urge Congress to, No. 1, reinstate collector sewers for eligible project funding and to continue funding of all projects at the 75-percent level.

Further, we would support a tax of 5 cents per gallon on all manufactured water to insure the local share. This would give West Virginia an income of approximately $44 million per year which could be used as matching money for both water and sewer.

It appears that the drafters of the new congressional policies for funding of wastewater treatment are not familiar with the alternatives faced by our communities who must make the final decision on wastewater disposal. Congress should be wary of endorsing changes that have not proven to be compatible with the American lifestyle.

Mr. Chairman and members of the committee, may I say to you how much we appreciate the opportunity of appearing today before your committee and would be happy to answer any questions.

Mr. ROE. This committee on the House side has fought since 1972 on just the issue that you speak to, but the other body is the one that has forced the issue. We are going to try it again. At least that is my intention, and I think the committee will support that.

Let me ask a different question. We had the National Society of Professional Engineers testify here and I was kind of shocked at their point of view because they said they did not think that we should be having any grant program at all. They would prefer to see if any other program was substituted, they would prefer to see a 100-percent loan program and a 5- to 6-percent interest rate. It took us about a half hour to get that point out.

They were talking about eliminating the matching program entirely, which seemed to be their first thrust, and then came back that they were talking about 100 percent funding for a loan effort. We are trying to figure ways to get that done, too, and try to establish the priorities.

You probably listened to NAM testify this morning. I don't know how people expect to get this job done unless we get back to the issues involved.

I don't want to take up the time, but the same way with combined sewers. The collector systems and the combined sewers were

part of the original act of 1972. It was very sound and valid engineering, and technical, and practical.

The other body has stricken both of those issues as we have gone along. We have not been able to prevail, unfortunately.

So I think you are right on target, as far as I am concerned. I know this committee feels the same way.

Now, how we can prevail, I don't know. But you do have two Senators and that could be helpful. I know that Nick Rahall has been a champion of the whole program from the very beginning, but we have not been able to get enough votes on the Senate side.

So we sustain and support your objectives and we will try again.

Mr. HART. Thank you very much, sir.

Mr. ROE. Any other questions?

Mr. RAHALL. Mr. Chairman, I certainly want to thank you for those comments and add to them that you have certainly been a friend in this regard and have been a strong fighter for what we have been trying to do with the construction grant program.

I have a question for John or Nick. Besides what you have recommended in your testimony, the inclusion of collector systems and the need for additional funding, are there any other changes that might be possible that we could make in addition to that, perhaps expediting the time that it takes to follow through on one of these projects?

Mr. HART. Yes, sir. Congressman, I think the delegation to the States is the only way. I think what we would say is if we maintain the status quo and improve on what we have, rather than change, is what we are really looking for here. The system is working now the way it is.

Mr. RAHALL. You feel streamlining the process is being undertaken now?

Mr. HART. Yes, it is. For example, West Virginia just received allocation to handle EPA problems and this was signed by our Governor last Tuesday. So we feel things are working.

Mr. RAHALL. Now, I am interested in one comment you made about the imposition of a 5-cent-a-gallon charge on manufactured water. I wonder if you might explain this a bit more and why in today's economic climate we should be asked to impose an additional tax.

Mr. HART. Well, I look at the highway trust fund tax. We put tax on gasoline and it was set aside basically for the particular problem over on the highway side. In West Virginia, we have extreme problems on local share on 25 percent, if there could be some kind of tax on manufactured water.

I live down in Charleston and I had my water system and it would be set aside in a trust fund to help provide local shares to the communities down in Monroe County and those places which can't raise that local share, perhaps a revolving fund.

We don't have all the answers on it, but at least there would be something set aside. You would raise a tremendous amount of money.

Mr. RAHALL. Let me turn to collector lines, if I could. What percentage of the total project cost is the collector line in a typical sewer project?

Mr. HART. On my projects they are running 75 to 80 percent, which we get back to this 10-percent situation of Federal funding if we eliminate it.

Mr. RAHALL. Thank you.

Thank you, Mr. Chairman.

Mr. ROE. I think it would be helpful for you to make contact with John Hart, particularly because you represent the West Virginia side of the question. I think you ought to get in touch particularly with the national society to see if we can get the act together, because I think it would be extremely important for you to express to them what you have expressed here.

Because I think you have hit the target right on the head, that if it is down to 55 percent now and we know that collector systems are limited, but I think the point you are making is that 75 percent on the average is your collector systems and you prorate that against the 55 percent you are not getting in Federal grant to install the system you are speaking to.

I am not sure but I think the representative was from a national group and I think that would be well worthwhile. In fact, I wonder if the national society has run any figures in each one of the respective States on that issue.

Mr. HART. I don't know. We will certainly contact them, Congressman.

Mr. ROE. Okay. I have no further questions.

Thank you very much for being here. Thank you for your patience. We will look into the matter further and see what we can do to prevail.

I have a statement from Congressman McEwen to place in the record at this point.

[The statement of Mr. McEwen follows:]

STATEMENT OF HON. BOB MCEWEN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. Chairman, I would like to thank all those individuals who have shared their insights and offered their recommendations before this Subcommittee on possible amendments to the Federal Water Pollution Control Act. It will be through the efforts of these concerned citizens that we will be able to make the law more effective in improving the quality of our Nation's waters. The testimony will undoubtedly prove helpful to the Subcommittee when it tries to fine tune the Clean Water Act by addressing the issues of toxic discharge, state water quality standards, the construction grant program, the dredge and fill permit program, and various other concerns. While we have made good progress in cleaning up our rivers, lakes and streams, it is the responsibility of Congress to ensure that clean water standards are maintained and strengthened for the benefit of future generations.

Mr. ROE. The subcommittee will recess until the next hearing date, which is starting November 1.

Thank you very much again.

[Whereupon, at 12:50 p.m., the subcommittee recessed, to reconvene on Tuesday, November 1, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, NOVEMBER 1, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to notice, at 10:07 a.m., in room 2167, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen.

This morning the Subcommittee on Water Resources begins the last 3 weeks of hearings on possible amendments to the Federal Water Pollution Control Act. During this period we will receive testimony on a number of important issues. During the first 2 weeks the testimony will cover the pretreatment program, section 404, water quality standards and other issues. On November 15, witnesses will include representatives of State and local governments and Hon. William D. Ruckelshaus, Administrator of the Environmental Protection Agency. The subcommittee has set aside November 16 to receive testimony on the very important subject of pollution from nonpoint sources. And we are going to be devoting quite some attention to that most important issue. The hearings will conclude on November 17 with a briefing on the Environmental Protection Agency's Chesapeake Bay study and the water quality monitoring and data collection program of the U.S. Geological Survey.

The information presented at these forthcoming hearings together with that received during prior hearings will provide the subcommittee with a truly comprehensive record on the present functioning of the water pollution control program, suggested changes, and water quality problems which still confront the Nation.

Our first witness today is Mr. John King of the National Solid Wastes Management Association. Before we hear from Mr. King, I yield to my distinguished colleague from the State of Oregon, Hon. Robert F. Smith.

Mr. SMITH. Thank you, Mr. Chairman.

I just want to add my thoughts, and thank the witnesses for being here today to assist us in coming up with the finest effort for a National Clean Water Act that we can find, and thank you for taking the time and effort to be here with us. We look forward to your testimony.

Thank you, Mr. Chairman.

Mr. ROE. I thank the gentleman from Oregon.

Now, we have Mr. John King, and if you would identify Ms. Shulman, who is your associate, director of the regulatory affairs of the Tricil Environment Services, Dayton, Ohio; is that correct?

Mr. KING. That is correct.

Mr. ROE. The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF PHILLIP H. WATSON, PRESIDENT, TRICIL ENVIRONMENT SERVICES, ON BEHALF OF THE INSTITUTE OF CHEMICAL WASTE MANAGEMENT

The Institute of Chemical Waste Management (ICWM) of the National Solid Wastes Management Association (NSWMA) is pleased to have the opportunity of these hearings before the Subcommittee to present its grave concerns that inadequacies in the present regulation of toxic discharges into the nations sewers represents an unreasonable threat to the human health and the environment. Moreover, legislation which will soon be considered on the House floor virtually invites a class of potentially dangerous contaminants to be discharged into sewers by denying the disposal alternatives in current use.

Without swift action by the Congress, particularly in light of the expected enactment of amendments to the Resource Conservation and Recovery Act, discharges of dangerous toxic wastes into sewer systems will increase significantly by 1985. We urge adoption of an amendment to the Clean Water Act closing off this loophole for the presently unregulated discharge of chemical waste.

Enormous strides have been made in this country over the past fifteen years in terms of both awareness and control of environmental contaminants. With enactment of the Clean Air Act in 1970 and the Clean Water Act in 1972, Congress took significant strides towards protecting those media from environmental contamination. Four years later, Congress enacted the Resource Conservation and Recovery Act of 1976 establishing a federal program to control pollution of the land,

the so-called "last sink." By now, we clearly recognize the principle that industrial generators of pollution can shift their discharges from media to media, from air to water to land. In RCRA, the Congress envisioned not only protection of the land but an even-handed tightening down of controls that would prevent one media from becoming the "dumping ground" for pollutants whose discharge was regulated into another media.

Coordination of the various federal environmental statutes has proved a difficult, but essential task. Much of the substantive improvement to the water, air and hazardous waste programs since their initial enactment has been aimed at closing loopholes and improving the interface between these programs.

Member companies of the Institute of Chemical Waste Management operate commercial hazardous waste treatment and disposal facilities, which are subject to all environmental regulations. As such, we are not only entirely familiar with the types of waste streams being produced by hazardous waste generating industries, but we, the EPA, the Congress and the general public are becoming more and more aware of exactly where those hazardous wastes are being directed. Recently, the EPA announced that on-site waste generators are currently treating and disposing of four times as much waste as had been previously calculated. In addition, millions of tons of hazardous waste go unregulated, through the so-called "small quantity generator" exemption from the regulation, from the unregulated combustion of hazardous waste in utility and industrial boilers and through

discharge into Publicly Owned Treatment Works (POTWs). Earlier this year Office of Technology Assessment calculated that 5 million tons of hazardous waste were being discharged into domestic sewers in 1981. It is this problem which we call to your attention and commend for your remedial action.

The EPA has excused from federal regulation those who discharge hazardous waste into public treatment works on the logical assumption that discharge of these toxic materials would be subject to pretreatment standards to protect the integrity of the POTWs receiving them. Unfortunately, little such protection exists today. EPA's tardy promulgation of the categorical pretreatment regulations led to a 1976 court-ordered schedule to produce pretreatment standards for 21 generating industries. In the seven years since the court order, EPA has issued only one as final, for the electroplating industry. EPA's exemption of toxic metal discharges for this industry is just now starting to close. Twenty other industries continue to enjoy exemption from RCRA and no federal controls on toxic discharges under the Clean Water Act. Clearly, the existing provisions represent neither a sizable nor comprehensive system of protection for POTWs, or their receiving waters.

POTWs are not generally designed to handle all toxic wastes generated by industry, particularly heavy metals. While many systems are fully adequate to handle conventional pollutants (although this subcommittee well recognizes that many systems are not even adequate to this purpose) the challenge of detoxifying chemical waste can be utterly

beyond the management experience and, often technical capacity of these facilities. Thirty-five percent of the 15,000 POTWs are passing toxics to surface waters in violation of NPDES permits and water quality standards. After all, these facilities were not built to treat hazardous wastes, but to handle domestic sewage. To us it seems highly unlikely that misuse of the nation's POTWs as chemical waste treatment plants would be a cost effective solution to managing industrial wastes in this country.

As if the present discharge of five million tons of toxic chemical wastes into the nation's sewers is not threat enough to compel Congress to act, the House will soon consider H.R.2867 which could mandate the prohibition of land disposal of a series of hazardous wastes within twelve months of enactment. These wastes include those with certain concentrations of cyanides, arsenic, cadmium, chromium, lead, mercury, nickel, selenium, thallium, highly acidic wastes, polychlorinated biphenyls or halogenated compounds. The authors of H.R.2867 feel that these wastes are so dangerous that Congress should not even conduct a rulemaking before prohibiting their land disposal. Whether or not one accepts the validity of this presumption, the implications of the enactment of such a provision can be clearly understood: these wastes must go somewhere else.

Authors of H.R.2867 hope that these wastes will go to hazardous waste treatment and disposal facilities such as those operated by our member companies. We fear another fate is far more likely: these waste will simply be discharged into POTW systems which will be unprotected from

their effects by any pretreatment standards. Since the discharge is entirely legal under our federal hazardous waste laws and in the absence of pretreatment standards which prevent such discharges under our water pollution laws, we would predict that by early 1985 significant quantities of these identified "high risk" chemical wastes will be recorded in the nation's POTWs, including the 4,500 POTWs already in violation of their permits.

We should not allow this to happen. Concurrent with the Congressional restrictions on the land disposal of these wastes should be elimination of the blanket RCRA exemption for the discharge of these chemicals into POTWs. Rather than simply proceed on an industry-by-industry basis to develop pretreatment standards, EPA should be directed to develop standards within the next twelve months which regulate the discharge of these particular toxic waste streams to POTWs, and allow exemptions for the 21 industries only to the extent POTWs can actually demonstrate toxics mitigation. If the technology of a POTW is incapable of successfully treating any of these wastes, its discharge into a POTW should be eliminated entirely. In this way, the discharge of hazardous waste would undergo the same scrutiny whether it is treated by our industry or poured down the sewer.

As an industry, the waste service industry is committed to protection of the nation's drinking water supplies. We are extremely sensitive to environmental releases which threaten both surface water and groundwater. We have sought the development of consistent standards

20-955 O—84——82

for the quality of surface waters and groundwaters. We have campaigned for comprehensive coverage of our anti-pollution laws which would prevent the unregulated discharge of contaminants into potential drinking water sources. We support vigorous and even-handed enforcement of those laws.

Recognizing that our science grows better year by year and we are pushing ahead in our ability to understand and deal with problems of environmental contamination from toxic wastes and the myriad of other sources of environmental contamination, we should ask ourselves at every turn if we are doing the best job we can with the information we have available to us right now. On the face of it, we are clearly not doing the best job in terms of protecting our POTWs against all discharges of toxic chemical waste. We are not doing the job today. We will be abysmally inadequate in another year when these "high risk" wastes are encouraged to seek "alternative disposal."

Coordination of two different environmental programs is a challenge, admittedly, but urgent and creative action is required.

Congress should amend both the hazardous waste and clean water statutes to deny the option of unregulated discharge of toxic chemicals into the nation's municipal sewage plants.

Mr. ROE. Please proceed.

TESTIMONY OF JOHN KING, DIRECTOR OF REGULATORY AFFAIRS, TRICIL ENVIRONMENT SERVICES, DAYTON, OHIO, ACCOMPANIED BY ARLEEN SHULMAN, FEDERAL AFFAIRS MANAGER, NATIONAL SOLID WASTES MANAGEMENT ASSOCIATION, WASHINGTON, D.C.

Mr. KING. Good morning, Mr. Chairman and members of the subcommittee. I am John King, director of regulatory affairs, Tricil Environment Services of Dayton, Ohio.

On my right is Arleen Shulman, Federal affairs manager of National Solid Wastes Management Association.

The Institute of Chemical Waste Management of the National Solid Wastes Management Association is pleased to have this opportunity of testifying at these hearings before the subcommittee, and to present our grave concerns about the inadequacy of present regulation of toxic discharges into the Nation's sewers, represents an unreasonable threat to the human health and the environment.

Moreover, legislation is now being considered on the House floor which virtually invites a class of potentially dangerous contaminants to be discharged into the sewers by denying the disposal alternatives in current use.

Without swift action by the Congress, particularly in light of the expected enactment of amendments to RCRA, these discharges of toxic wastes into sewers will certainly increase by 1985. So we urge adoption of amendments to the Clean Water Act that will close the loophole for presently unregulated discharge of chemical toxic wastes in the sewers.

A number of companies of our Institute of Chemical Waste Management operate commercial hazardous waste treatment facilities around the country. We are all subject to environmental regulations, and as such, we are not only entirely familiar with the types of waste streams being produced by the hazardous waste generating industries, but we, and the EPA and the Congress and the general public are becoming more and more aware of exactly where those wastes are being discharged.

Recently, the EPA announced that waste generators are currently treating and disposing of four times as much waste as had previously been calculated at their own sites. In addition, millions of tons of hazardous waste go unregulated through the so-called small quantity generator exemption under RCRA, directly to landfills without treatment.

Earlier this year, the Office of Technology Assessment calculated that 5 million tons of hazardous waste were going to the domestic sewers per year, and this problem is the one that we call to your attention, and we recommend for remedial action through amendment of the Clean Water Act.

Now, EPA has excused from Federal regulation those who discharge to publicly owned treatment works on the apparently logical assumption that these discharges would be subject to the categorical pretreatment standards under the Clean Water Act.

Unfortunately, as we all must realize, the categorical standards are not in force, and such protection does not exist today.

EPA's long delay promulgation of the categorical treatment standards led to the 1976 court order, which we are all very familiar with, for 21 generating industries. In the 7 years since the court order, EPA has only issued one set of standards as final, and that being for the electroplating industry. The electroplating industry is starting to feel the effects of that loophole being closed. No longer can they enjoy the RCRA exemption and the lack of a categorical standard. Their discharges to the sewers are indeed being regulated.

Clearly, in the face of 20 other industries still enjoying the RCRA loophole, and the lack of pretreatment standards, amendments to the Clean Water Act is mandated by the public.

Now, we would point out that publicly owned treatment works are not designed to handle toxic metal-bearing wastes. While many of the systems that are in operation, particularly the large ones, can handle the metal-bearing waste through the dilution effect, dilution being the solution to the pollution for them, they are not designed to treat metal wastes. The metals are either going to the sludges, or they are going to the Nation's waters. As a result, 35 percent of the 15,000 POTW's are passing these toxic metals to the surface waters in violation of their NPDES permits and the water quality standards.

To us, it seems unlikely that the misuse of the Nation's POTW's as chemical treatment facilities, as opposed to municipal waste water treatment facilities is unacceptable.

Now, as if the present discharge of 5 million tons of toxic chemical waste into the sewers is not threat enough to compel congressional action, the House is now considering H.R. 2867, reauthorization of RCRA, which will prohibit land disposal of these very toxic metals, the California list, as such.

The authors of H.R. 2867 feel that these toxic wastes are so dangerous that Congress should not just mandate EPA regulation of disposal landfill, and to the land, but implement statutory prohibition.

Now, these authors of H.R. 2867 hope that these metal-bearing wastes will go to treatment prior to disposal, but we fear that another fate if more likely. We think that these wastes will move, by 1985, in the face of such land prohibition, to the easiest course, the easiest route, the POTW, the RCRA loophole.

Since the discharge to the POTW's is entirely legal under our present Federal hazardous waste laws, and in the absence of pretreatment standards, which prevent such discharges under our water pollution laws, we predict in fact that by early 1985 significant quantities of these high risk chemical wastes will be recorded in the Nation's POTW's, including the 4,500 POTW's that are already in violation of their permits. We should not let this happen.

Concurrent with congressional restrictions on land disposal of these wastes under RCRA, EPA should be directed to develop standards which will prohibit such discharges to POTW's, not just for the 21 industries, but for all industries which can be identified to discharge to the sewers.

Now, we commend Representative Molinari for taking a much needed first step with amendments to RCRA. His amendment will require a report to Congress in 15 months, identifying which haz-

ardous wastes are unregulated because of the POTW loophole, and would require those who use that loophole to notify the EPA, and would direct the EPA to revise RCRA regulations where necessary.

Now, NSWMA and the institute believe it is necessary to be more explicit also under the Clean Water Act. Coordination of two different environmental programs is certainly a challenge, and admittedly, an urgent and creative action is necessary, but Congress should amend both the RCRA and the clean water statutes to deny the option of unregulated discharge of toxic chemicals into municipal sewage treatment plants, before the Nation's waters become inevitably poisoned.

I wish to thank the chairman and the committee for the opportunity to testify here today.

Mr. ROE. The Chair wants to thank the gentleman for his splendid testimony; I think you hit upon a very important, if not vitally important issue right on target. I am aware of what is happening.

I do not think they are going to take that bill up today, are they? RCRA will not be taken up today. I guess they will be adding those amendments next week.

I think what you are saying is very important. We are all going to look into this because of the interrelationship, as you pointed out, between different legislative processes that we go through here. I am thinking of the water resources development bill, the clean water bill, RCRA is all one and the same as far as I am concerned and as far as this committee is concerned. So we will, by all means, be addressing this issue most thoroughly, as you have presented in your testimony, and I want to thank you for your input.

Now, are there any questions by the gentleman from Pennsylvania?

Mr. EDGAR. Mr. Chairman, I arrived late. I apologize.

I do not have any specific questions. I appreciate your testimony.

Mr. ROE. Thank you very much, Mr. King and Ms. Schulman.

Our next witness is Mr. Richard Austermann representing AMAX, Inc.

We want to welcome you to our committee, Mr. Austermann. The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF RICHARD O. AUSTERMANN, AMAX, INC., ON THE CLEAN WATER ACT AMENDMENTS

Mr. Chairman, my name is Rick Austermann. I am an attorney with AMAX Inc. in its molybdenum division in Denver, Colorado. My responsibilities include the management of rulemaking and permitting in the environmental area.

AMAX Inc. is a diversified mining and energy company with operations worldwide. The company explores for, mines, refines and sells a wide variety of minerals and metals. AMAX's principal products are molybdenum, coal, lead, zinc, copper, iron ore, petroleum and natural gas, potash, phosphates, nickel, cobalt, tungsten, silver, gold and magnesium. Through ALUMAX Inc., a 50 percent-owned affiliate, AMAX is also involved in the production and marketing of aluminum and aluminum products.

We appreciate the opportunity to appear before you today. My testimony will be limited to just one issue -- water quality standards, how they are adopted, and restrictions on their subsequent modification. I have also attached a statement addressing additional issues that I would like to submit for the record.

The two bills now being considered in the Clean Water Act debate, H.R. 3282 and S. 431, would amend the Clean Water Act by imposing significant statutory restrictions on the states' ability to "downgrade" use designations. These amendments were offered in response to EPA's proposal, in October 1982, to modify current regulations on the same subject.

While EPA's proposal may have been overbroad in some respects, we believe that it also addressed some legitimate issues, issues we are facing in our permits today. In our opinion H.R. 3282 and S. 431 fail to resolve these issues, and in the long run may create more problems than they solve.

So that you may understand our concerns, let me briefly describe our experience in Colorado.

AMAX owns three mines in Colorado, all of which have discharge permits. Unlike some other states, Colorado has adopted and enforced very stringent water quality standards. As a consequence, at two of these mines our permits are "water quality limited"; that is, the effluent limitations are more stringent than BAT guidelines. For instance, at our Climax mine, our zinc limit is two times more stringent than BAT, our copper and cadmium limits are four times more stringent than BAT, and our lead limit is seventy-seven times more stringent than BAT. Since 1975 we have been engaged in a continuing effort to meet these limits. On so doing we have spent well over twenty million dollars for treatment facilities, and we spend approximately two million dollars each year to operate them.

As a result of this effort, two streams that were biologically dead have been restored to life. Trout can swim all the way up to our discharge points. For most parameters, our discharges meet drinking water standards.

We assume that this is the kind of behaviour Congress wants to encourage. However, if H.R. 3282 or S. 431 are adopted in their present form, just the opposite result may occur:

i) First, as a matter of pure logic, these amendments are not necessary to accomplish either the interim goal of "fishable, swimmable" waters, or the ultimate goal of restoring and maintaining the chemical, physical, and biological integrity of our waters.

ii) Second, the amendment is likely to create severe administrative problems for both states and the regulated commmunity as they go beyond BAT. For this reason, the amendment may deter states from adopting ambitious water quality goals.

iii) Third, the amendment tends to punish states and dischargers that have done the most to comply with the Act.

All of these problems are the result of uncertainties inherent in the process of going beyond BAT. I think the problems we have encountered in the mining industry are a good example of this.

First of all, it is well to remember what BAT stands for -- the best available technology economically achieveable. When an industry such as ours is asked to go beyond BAT, it is not possible to "go to the shelf", so to speak, and install a treatment system that is guaranteed to work. Systems have to be designed on a case by case basis, and neither a company nor a state can ever know for sure just what level of treatment is attainable.

For instance, at the Climax mine almost all of our wastewater originates as precipitation. The volume of this wastewater, and its physical and chemical characteristics, vary from season to season and from year to year as the weather changes, and as operations change. As a consequence, it is not possible to simulate "real world" conditions in a laboratory or in a pilot plant. The only way to define the true capabilities of a particular treatment system is to install it and run it. At Climax we spent more than two years on a "fast track" research effort just to test a number of treatment systems that had never before been used in the mining industry. We built our treatment plant on the basis of this research. Yet since going into operation, in order to improve our treatment capabilities, we have had to make two major modifications to our treatment scheme. The process chemistry now is entirely different from what it was just three years ago. I fully expect further changes to occur and applicable law should take this into account.

Another point worth making here is that we cannot "turn off" our discharges. Indeed, when our facilities temporarily shut down the volume of our wastewater actually increases.

Why is all of this important? Because as we have learned more about what we can do in the way of treatment, we have had to adjust applicable water quality standards. In one instance, we have had to request that Colorado "downgrade" the use designation of a stream segment. After extensive hearings the state has complied with our request, but EPA has not yet approved this action. Although approval would seem to be warranted under the present statute, I am not at all certain that EPA can do so under its current regulations. Worst of all, the House bill would now incorporate these regulations into the statute; the Senate bill would include even more stringent restrictions. If either bill is adopted and our request is not approved, then the company will be subject to civil and criminal penalties despite eight years of good faith cooperation with the state and EPA, and notwithstanding the fact that the stream is now fishable and swimmable.

We believe that Colorado's decision was reasonable, and we believe that the Act should remain flexible enough to allow similar decisions in the future.

Let me clarify what I mean by "downgrading", because states have not been uniform in their approach to use designations. In Colorado, the State Water Quality Control Commission has adopted at least five different aquatic life use designations which vary in their degree of stringency. When we "downgraded" our stream, we replaced a very stringent aquatic life classification with one that was slightly less stringent. As I have noted previously, trout still swim up to our discharge point. The stream is fishable and swimmable.

I suspect that the problems we have encountered during the last eight years will become common as more and more companies move beyond BAT. It has been extremely difficult and time-consuming for us to operate under EPA's current regulations, which of course formed the basis for the amendment appearing in H.R. 3282. As more and more companies begin to encounter these problems, there is real danger that the regulatory mechanism will grind to a halt. As an inflexible rule of substantive law, it will create more problems than it solves.

There are a number of ways this problem might be solved. AMAX proposed specific amendments to S. 431 during Senate hearings on that bill. We would be pleased to do the same as to H.R. 3282.

ATTACHMENT

ADDITIONAL COMMENTS BY AMAX INC.
ON AMENDMENTS TO THE CLEAN WATER ACT
BEFORE THE HOUSE WATER RESOURCES SUBCOMMITTEE,
HOUSE PUBLIC WORKS & TRANSPORTATION COMMITTEE

NOVEMBER 1, 1983

Following are AMAX's comments on other sections of the Clean Water Act that we believe should be considered by the Committee.

BAT Compliance

We endorse extension of the compliance deadlines for technology based effluent limitations. EPA has not yet promulgated categorical guidelines for many of our operations. Even for guidelines expected to be proposed soon, such as for tungsten, we need additional time to identify and install equipment necessary to meet these limitations.

Pretreatment

AMAX supports efforts to amend the Clean Water Act which recognize the need for flexibility in local pretreatment operations. However, procedural limitations, such as the various deadlines for applying for an alternative pretreatment system, are counterproductive and should be eliminated.

Point Source Definition/Storm Water Runoff

AMAX supports the language in the Senate Bill, S.431, that would exempt certain mine-related stormwater runoff discharges from normal permitting requirements (Section 402(l)).

AMAX believes that this is a fair amendment; some stormwater runoff devices are voluntary means of pollution control and should not be subject to permit requirements. Many mining operations located in mountainous, snowpacked areas, collect runoff around their mine sites to keep such water from coming into contact with process water. To require such operations to meet normal permit requirements seems unreasonable given the voluntary nature of the collection devices, which in and of themselves prevent or minimize pollution.

Section 404

AMAX believes that problems with Section 404 of the Act warrant Congress's attention. We are offering two very specific amendments to the definitions of "navigable waters" and "wetlands" which reflect our concerns.

Navigable Water Definition - EPA has defined the term "navigable waters" broadly to include streambeds that have water in them only intermittently as a result of rain or snowmelt; do not support fish, shellfish or wildlife; do not provide water to downstream users; and do not flow into other bodies of water.

Due to this broad definition, discharges which do not harm surface waters or adversely affect the water quality of other water bodies must still bear huge financial burdens to comply with effluent limitation regulations.

We suggest language that would limit the definition of "navigable waters" as follows:

> For purposes of this act, the term "navigable waters" shall exclude waters that do not support a diversified fish, shellfish, or wildlife population, do not provide water to downstream users, do not flow into other water bodies, and have a 10-year, 7-day low flow of zero. "Navigable waters" shall be defined as those waters which have, as a minimum, a six mile drainage net.

Wetland Protection - During the last decade, the Corps of Engineers' Dredge and Fill jurisdiction has expanded from "navigable waters of the United States" to include "wetlands and those areas adjacent to these waters", then to "adjacent tributaries and wetlands", and finally to uplands that are wet only part of the time, and thus contain "wetland type vegetation". Often the program's requirements grossly infringe upon personal property rights. Not all "wetlands" are equally valuable. Yet, under current definitions, all wetlands must receive equal protection, even if they are areas of farmland temporarily saturated by snowmelt, or artifical formed wetlands created by irrigation or dredging activity.

AMAX suggests that an acceptable solution to this problem would be to exclude all man-made, or unnaturally formed, or "artificial" wetlands from the statutory definition.

Mr. ROE. Please proceed.

TESTIMONY OF RICHARD O. AUSTERMANN, ESQUIRE, AMAX INC., DENVER, COLO.

Mr. AUSTERMANN. Thank you very much, Mr. Chairman.

My name is Rick Austermann. I am an attorney with AMAX. AMAX is a diversified mining and energy company with operations worldwide. I work for its molybdenum division in Denver, Colo. My responsibilities include the management of our participation in environmental rulemaking and permitting proceedings.

I appreciate the opportunity to appear before you today. What I want to do is to address a single issue that a number of other witnesses have already raised in much briefer fashion, and that is the problem of water quality standards, how they are adopted and restrictions on their modification.

The two bills that are now being considered in the Clean Water Act debate, which are H.R. 3282 and S. 431, would amend the act by imposing significant statutory restrictions on the States' ability to "downgrade" use designations.

As I understand it, these amendments were offered in response to EPA's proposal in October of 1982 to modify current regulations on the same subject.

I believe that EPA's proposal may have been overbroad in some respects. However, in our opinion, we believe that the proposal also addressed some legitimate issues, issues that we are facing in our permits today.

In our opinion, neither of the bills currently before the House or Senate adequately resolves these issues and, perhaps in the long run, they could create more problems than they solve.

So that you can better understand our concerns, I would like to briefly describe the experience we have had in Colorado. AMAX owns three mines in Colorado. They are in net precipitation areas, and all of them have discharge permits. Unlike some other States, Colorado has adopted and enforced very stringent water quality standards. This is something that I think sometimes gets lost in debate. People seem to think that no one has gone beyond BAT. Well, this is not the case in Colorado.

At two of our mines, our permits are water quality limited, that is, the effluent limitations are more stringent than BAT guidelines. For instance, at our Climax Mine, the zinc limit is two times more stringent than BAT guidelines. Our copper and cadmium limits are four times more stringent than BAT guidelines, and our lead limit is 77 times more stringent than BAT guidelines.

Since 1975, when we got our first water quality limited permits, we have been engaged in a continuing effort to meet these limitations and, in so doing, we have spent well over $20 million for treatment facilities and we spent approximately $2 million each year to operate them. The results of this effort have been positive; two streams that were previously biologically dead have been restored to life, and I am pleased to report that trout can now swim all the way up to our discharge points, and for most parameters the discharges meet drinking water standards. The water could be drunk without treatment—without further treatment.

Now, we assume that this is the kind of behavior that the Congress wants to encourage in these amendments and that what we have done during this period of time is really what people are talking about when they talk about going beyond BAT. However, based on our experience in doing this, we feel that if the House or Senate bills are adopted in their present form, just the opposite may occur.

I would like to briefly explain why I think that is so. First of all, as a matter of pure logic, the water quality amendments are not necessary to accomplish either the interim goal of fishable-swimmable waters or the ultimate goal of restoring and maintaining the chemical, physical, and biological integrity of our waters. Now, incidently, we support these goals, but EPA's current regulations and the restrictions on downgrading that are contained in the bills do not focus at all on the status of the water, what condition it will be in after the downgrading occurs.

Second, it seems to me that the amendments are likely to create severe administrative problems for both States and the regulated community as companies attempt to go beyond BAT. For this reason, I think the amendments may deter States from adopting ambitious water quality goals.

Finally, in my opinion, the amendments tend to punish States and dischargers that have heretofore done the most to comply with the act.

In my opinion, these problems are the result of uncertainties which are inherent in the process of going beyond BAT and the failure of the amendments to deal adequately with the uncertainties. I think the problems we have encountered in the mining industry are a good example of this.

Let me describe what we have been through. First of all, I think it is well to remember what BAT stands for. It is supposedly the best available technology which is economically achievable. Generally, this is equivalent to the best demonstrated technology, which is your new source performance standards.

Now, when a large industry such as ours is asked to go beyond BAT, you cannot call up your engineers and ask them to go to the shelf, so to speak, and to choose a treatment system that is really guaranteed to work. The systems have to be designed on a case-by-case basis and neither a company nor a regulating State can ever know for sure just what level of treatment is obtainable. For instance, at the Climax Mine, which I referred to earlier, almost all of our waste water originates as precipitation which falls upon our facilities. The volume of this waste water and its physical and chemical characteristics vary considerably from season to season and from year to year, both as the weather changes and as our operations change.

As a consequence, it is not possible to simulate these real world conditions in a laboratory or in any pilot plant. The only way to define the true capabilities of any particular treatment system is to install it and run it. It is a very expensive process.

Now, at Climax, during the mid 1970's, we spent more than 2 years on a fast track research effort right after we got our permits. About all we were able to do at that time was to test a large number of treatment systems that had been used in other industries but that had never before been used in the mining industry.

We built our treatment plant on the basis of this research. However, building the plant was really just a beginning and not the end of our efforts. Since going into this, into operation, and in order to improve our treatment capabilities, we have made two major modifications to the plant and its process circuits and, in fact, the process chemistry that we are using today to treat this waste water is now entirely different from what it was just 3 years ago. It is an iterative process. Even though I think we have accomplished a lot, I fully expect further changes to occur, and I believe that applicable law should take this into account.

Another point that I think I would like to make here is that in the mining industry we cannot turn off our discharges as you might in some other industries. As I indicated before, the source of our waste water is precipitation and, in fact, because of our consumptive use of water, when our facilities temporarily shut down, the volume of our waste water actually increases.

I have gone into quite a bit of detail here, and the question is—why is all this important? I think it is important because as we have learned more about what we can do in the way of waste-water treatment, in response to these changing circumstances, and in order to stay in compliance with the law, we have had any number of occasions to request adjustment of applicable water quality standards. In one instance, we had to request that Colorado downgrade the use designation, which is the heart of the present controversy.

Now, after extensive hearings, the State complied with our request to do this. Because of administrative delay, EPA has not yet approved this action, although approval would seem to be warranted under the statute. I am not all certain that EPA will do so under its current regulations. I believe that they are far from clear in their application. And worst of all, at least from my point of view, of course, we have the situation now where the House bill would incorporate these regulations into the statute and the Senate bill would, in its present form, go considerably further and include even more stringent restrictions. If either bill is adopted and if, as I fear, our request is not approved because of this, then the company will be subject to civil and criminal penalties despite 8 years of good faith cooperation with the State and EPA, and notwithstanding the fact that the stream which once was dead is now fishable and swimmable.

We believe that Colorado's decision was reasonable and we believe that the act should remain flexible enough to allow similar decisions in the future.

Before closing out my testimony, I would like to clarify what I mean by downgrading. I think this is important because the States have not been uniform in their approach to use designations and I think it is a bit anomalous that we should adopt a uniform Federal rule on water quality standards when, in fact, the States do not approach this topic in the uniform fashion.

In Colorado, the State water quality control commission has adopted at least five different aquatic life use classifications, as they call use designations, which vary in their degree of stringency. It depends upon the number of species present, their vitality, and their sensitive species. When we downgraded the particular stream

segment at Climax, we replaced an extremely stringent aquatic life classification with one that is only slightly less stringent. As I noted previously, trout still swim up to our discharge point and the stream is fishable and swimmable. So, when people talk about downgrading, say downgrading an aquatic life use designation, they are not talking about devastating the stream necessarily.

Now, I suspect—I fear, like I said, we have been involved in this process for a long time, and I suspect that the problems that we have encountered during these 8 years will become common as more and more companies attempt to go beyond BAT. I understand it is not the common practice, at least in the East right now, although it is what people are pushing for.

In our experience, it has been extremely difficult and time consuming for us to operate under EPA's current regulations. It seems that as more and more companies begin to encounter these problems, there is a real danger that the regulatory mechanism will grind to a halt. It seems to me that the current system is too inflexible and, if retained, will create substantial problems.

Now, in our opinion, there are a number of ways in which this problem might be solved. On the Senate side, we did propose specific amendments to S. 431 during the hearings there. We would certainly be pleased to do the same before you. I do not think, however, there is any need to repeat at this time the remainder of my statement, but I would be pleased to answer any questions that you might have.

Mr. ROE. Well, we want to thank you for your comprehensive testimony. It may be very necessary to repeat the rest of it because you built the case but you have not made the points.

Why do you not go through with the rest of it? It is only two pages. Let us go through that.

Mr. AUSTERMANN. OK. Actually the other two pages——

Mr. ROE. What the other body does does not necessarily mean that this body will do the same thing. You realize that.

Mr. AUSTERMANN. Fine. Yes, I understand that, Mr. Chairman.

Actually, the other two pages deal with separate issues. Let me shoot from the hip, though. I think you are asking for my specific recommendations on the water quality standards problem?

Mr. ROE. Well, I think you have set a case, from the Chair's point of view, as to your concern, which is a little confusing, and could be contravening in part. I do not think you mean to do that.

You are saying that in the specific case you brought in reference to that stream in Colorado. You went back to Colorado, and we say we agree with you, from the point of view that the States are not uniform in there, and that is one of the concerns of this committee for a long time. In other words, everybody says we will turn everything back to the States, they can run it better than Washington, the bureaucracy in Washington, and the whole thing. But when we get to that particular point, in substance, many of the rules and regulations in the States are far inferior, which is the whole purpose of establishing the National Clean Water Act in the first place, to get some kind of national standards for the obvious reason.

So therefore, having said that, you are coming back and saying, and I think legitimately so, in part, that there are particular types

of production operations in the Nation, whether it be mining, or whatever at this point. Where in order to meet the BAT requirement, that you just cannot take this particular thing to do that issue, that you are going to spend that kind of money, you may have to expand that expenditure, and it will produce, in effect, a higher quality treatment, is that a fair comment to make?

Mr. AUSTERMANN. Oh, yes. And in fact, we have gone beyond BAT.

Mr. ROE. OK. But then if we are doing that, if we are meeting the BAT requirement, and going beyond that, why should we be looking for downgrading further? That is what is confusing to me.

Mr. AUSTERMANN. Oh, OK. We are not talking about downgrading the stream from what it was. What occurred, or what happened in this particular instance was that the State adopted very ambitious goals of turning a stream that was biologically dead into an absolutely top flight pristine mountain stream.

At the time the State did this, this was back in 1974 and 1975, nobody had a lot of information, either about the existing water quality, what level of water quality it might take to support such aquatic life, or what type of treatment it might take to accomplish the desired result. It has been a very long process, over a period of 8 years, to go about doing this.

Now, after conducting our initial research, installing a plant, treating the water, bringing it back to life, this stream has become biologically viable. It did not meet the State's use classification that it adopted, though. It was not the purest form of high mountain stream, if you will. It did not have the most sensitive species in it.

As a consequence——

Mr. ROE. Why should it not have?

Mr. AUSTERMANN. Excuse me?

Mr. ROE. Why should it not have? I want to be the devil's advocate. Why should it not have?

Mr. AUSTERMANN. Because the treatment plant that we designed and operated, and which everyone agreed seemed to be the best approach, just did not get the job done. It was not capable.

Mr. ROE. To meet the standards?

Mr. AUSTERMANN. To meet the standards. The goals that had been set.

Mr. ROE. That Colorado——

Mr. AUSTERMANN. Had set.

Mr. ROE. All right, go ahead.

Mr. AUSTERMANN. And at the time—OK, when everyone decided that that was the situation, that if in fact the stream was to be upgraded even further to meet the designation, that additional treatment, additional controls would have to be adopted. That what we had agreed to previously just was not going to get the job done.

But we did some preliminary calculations as to what it might cost, again without really knowing, at this stage of the technology, we do not know for sure what you can accomplish. We made our best effort to guess what level of treatment might be required to upgrade the stream that one additional bit, and we held very extensive hearings for the State over a period of years, and the State decided that it simply was not worth it.

Mr. ROE. Well, but then that becomes a function of cost.

Mr. AUSTERMANN. Yes.

Mr. ROE. Is the basic point—and then you are going back to your testimony, you mentioned that the BAT standards was based upon the best available technology that is economically achievable, which is part of the existing law.

What I am trying to get at is the euphemism of downgrading is misused in many areas. I think you are trying to develop that.

In other words, what do we speak to downgrading? What does this really mean? Is downgrading a word that can be used, or terminology and understanding that can be used as an across the board? Are we really talking about downgrading? Is the downgrading that is involved in Colorado's decision that is now awaiting EPA's further observations a downgrading from a national standard, or is it a downgrading from a Colorado standard?

I am leading to a point.

Mr. AUSTERMANN. Yes. I do not think, in my own personal opinion, nothing is being downgraded, all they are doing is adjusting the goals that they set. The stream has clearly been upgraded.

Mr. ROE. Were the goals they set higher standards than what the EPA had established under the designation of what they meant by fishable and swimmable waters?

Mr. AUSTERMANN. Yes.

Mr. ROE. They were economically viable, is that not in fact what the law says?

Mr. AUSTERMANN. [Nodding head.]

Mr. ROE. But basically what you are in fact saying is that to go further than what you have done now is a question of the function of cost, or technology, or both?

Mr. AUSTERMANN. At this stage, I would have to say both. But I think whenever you try to go beyond BAT, you always have mixed questions of technology and cost, because I do not think you could find an engineer in the world that would ever guarantee the ability of any beyond—BAT treatment system to meet certain specified effluent limits. All you can do is try.

Mr. ROE. What we are wrestling with, and share with me a minute, the following two points.

One, that we know that the fish are returning to the Hudson River. But, however, the latest reports, where PCB's and other issues are involved, the fish are highly deformed, and all kinds of warts, and growths, and so forth and so on.

I am just asking this from your professional point of view, that the fish are in the river, and I am looking to what the broad functions of our original decisions made in 1972, of fishable and swimmable, that is awfully broad.

How do you interpret that? The fish can come back into the Hudson, they are surviving, at least a little longer, but they are entirely gross, if you like, as to what they may have been, or would be, if the water was clear, that they could be able to survive in.

Mr. AUSTERMANN. Yes. I think clearly, from what you have described, that is not a desirable state of affairs, and it is a perversion of the system.

Mr. ROE. But it is getting to what the terminology and what the euphemism has been on what we term fishable.

Let me cite another case. New Jersey has been doing some very intensive work the last 15 years, probably the most advanced work in the world, in bivalve oyster culture.

When you look at the oysters, the oysters are there. They are subject to some predators that have been introduced from another area, they think from Japan. But however, one plant was producing, I mentioned this before, very slight oxide waste, and it was so slight that it met all of the national standards, and all of the standards of the known art of the business at that point, until they determined that oysters themselves naturally—they filter the materials out of the water as they feed, and consequently they are great concentrators. They concentrate in the copper, so that when the oysters, although they look nice and healthy, they are big fellows, and everybody would like to get into them, and when you open them up they are as green as a penny inside.

I am only bringing these points up to you, that the committee is wrestling with one or two issues, I know the other members feel the same way.

We, of course, want to do the right thing. We recognize the balance that has to be struck here. Somebody has to be a Solomon, at best, to work it out, but be that as it may, I am wondering if we are just going to be adding amendments, part of which you spoke to, or do we go as we are thinking about, going further behind these issues, to determine what we really mean by fishable and swimmable?

In other words, let us assume—and I am taking a little extra time, but I think you are a witness that can enjoy this exchange of view, is that a lot of natural fishlife feeds on the biota of the stream, and this is all part of upgrading that stream, to provide the resources that we want to, as far as wildlife is concerned. The fisheries, in this instance.

So therefore, if we speak of reducing the requirements further, for whatever the reason may be, then we are not really living up to what the intent of Congress was initially in this legislation, is that a fair comment?

Mr. AUSTERMANN. Well, Mr. Chairman, I think it depends—I hate to give such a lawyer-like answer.

Mr. ROE. No, it is OK.

Mr. AUSTERMANN. It seems to me that the basic problem you are grappling with is the problem of trying to define uniform and easily applicable Federal standards, which will then be applied to an extremely broad diversity of factual situations, in which it is very difficult to apply Federal tests.

Now, you know, the question I think you are talking about shellfish, and the fact that even though they are living and growing, are not edible.

Well, if you look at the history of the Clean Water Act, particularly 404, I think, I think you are correct, that to allow that situation to continue is probably not in accord with the original legislative intent.

But I would hestitate to say that on a uniform basis situations like that will occur. For instance, again, if you are dealing with fish that do not bio-accumulate this type of pollution, or which do not serve as a food source, the problem may not exist in different

20-955 O—84——83

parts of the country. I think that is the situation, and so I appreciate the problem. I do not have any good general answer.

I think it can be—if we can jump over to another section of the Water Act, though, and look at the 404 section, I think one of the subsections of that succinctly states the test that at least we are all aiming toward, and that is they should not approve the designation of a disposal site if it will have unacceptable adverse effects on the aquatic life, and what we are really trying to do is come up with good general test of what is unacceptable.

Mr. ROE. Well, I do not want to take up all the time, but I think you are again, you know, we are talking about a function of costs. If we had all the money in the world, then this would not be a major problem, because—at least as far as our technology is concerned. We would be able to say that the latest and most advanced technology to mankind, we spend the money to do it.

Is that not what the confrontation has been with industry, as far as trying to achieve the goals in fair play, in a point of being competitive, domestically being competitive, and internationally, and so forth, and so on?

Mr. AUSTERMANN. Well, certainly, I think as a matter of policy we sometimes get defensive, because we feel as if clean water is treated as if it were the only important resource.

Mr. ROE. Some people treat it that way, particularly if you have to drink it.

Mr. AUSTERMANN. That is exactly true, and I think no one would deny that it is an extremely important resource. But I suppose our point of view is that you can take treatment to the point of absurdity.

Mr. ROE. Let me finish on this point.

The Committee has been going through this legislation, and has devised this legislation since 1972. I guess we had amendments and modifications, and made course corrections, and all the other things, for 10 years, and we are making progress, you indicated that yourself.

Mr. AUSTERMANN. Yes.

Mr. ROE. So that is good. If it is a function of cost, one of the issues that has been involved, which is going through some members' minds, is two points.

One, we understand the competitive part of industry, and the problems that we are having internationally. We understand, jobs, and whatever. What Congress has done is they said to the American industry, hey, fellows, you have got to go out and do your thing in order to meet these goals.

What they said to the municipalities, and the subdivisions of government is we are going to have a matching grant program for you, or grants program to help expedite this, to provide the funding. You know the history behind that issue.

What is your right—what do you write off? Let us suppose you spent this $20 million. How do you handle that? How does your company handle that $20 million investment as a writeoff? What period of time do you write that off against your income?

Mr. AUSTERMANN. The capital expenditures, the $20 million for two treatment plants that are referred to, are treated just like any

other capital expenditure, they are amortized over the life of the plant.

Frankly, I do not know what that is.

Mr. ROE. Well, is there any—I am just asking because I do not know either, but we want to get some testimony to this effect.

Under the investment tax writeoff laws, can you use that any way whatsoever?

Mr. AUSTERMANN. If you are asking about us, we cannot use it right now, because we are losing money.

Mr. ROE. No; I mean is it—I do not want to go into that issue, but I am saying, to your knowledge, can it be used?

Mr. AUSTERMANN. I think that it probably can, if you are talking about accelerating your depreciation.

Mr. ROE. What I am trying to get at is should this committee be considering an issue to come back and say it is just impossible for us to meet this goal, and to be evenhanded and uniform, without some kind of a special tax writeoff, because that would innure directly to a particular case?

In other words, if there was a set of tax laws that were devised where we came back and said you would have accelerated depreciation over a 3-year period of time, and an investment tax credit over a 3-year period of time, that would go a long way for each firm being able to deal with that situation. By having national standard, they would have a methodology of recouping that capital cost?

Mr. AUSTERMANN. Yes; I agree. I think what that sort of thing would do is make it easier for firms to finance these large capital expenditures.. It probably does not get to the underlying issue of how much, as a matter of policy, do you want to make people spend.

Mr. ROE. Look, if they are going to either rewrite this law and say to you fellows that are coming in to testify, we are trying to listen to you intently and so forth, but you come up with some of the mechanism that does not exist. I am trying to figure out what that ought to be and it seems to me that if we are saying, and I am trying to buy your observation for the following points.

Let us assume your operation is at the headwaters of a stream that goes down through a whole series, the State of Colorado goes into larger and you have cumulative waste that you place all along the line. Should the person three quarters of the way down be responsible for the cumulative waste to clean up that section of the river. And the answer is of course, they should not be.

We are coming back and saying at the headwaters, well, you have done a certain amount and you could do a little bit more but you have a function of cost here. But if you came back and said, well, OK, you have got a grants program that is going to municipal plants and so forth and so on, but you have not provided any mechanism to industry, therefore industry looks at the point of view do we dump into a municipal sewer system, do we have to put our own plant in. What is the best thing for us to do, what do we do with pretreatment. And the cycle and Mr. King testified earlier today and he said look, if we have a hole in the RCRA bill and we have got 20 of the different categorical areas of toxic waste involved, other wastes involved in industry, that instead of trying to

dump it on the land, which they would not be able to do if that amendment is adopted, they are going to dump it into the sewers. OK.

Now, if all these forces are coming together, what people do not seem to realize around here is that the water resources bill, the clean water bill, the RCRA bill, the solid waste bill is all one and the same and it is all just the same thing. And many of the rules and regulations are contravening each other.

So, therefore, there is no mechanism that I am aware of now where the industry of this country can come back and say we will do our thing. But you have to give us some way to recoup those capital costs much quicker, over a 3-year period, a 4-year period, something of that nature. I just want to put that in your mind to think about.

Mr. AUSTERMANN. I agree.

We ourselves have looked at similar financing schemes. On the one plant, we were not able to do exactly as you suggested. We were able to obtain some industrial finance bonds which gives us a break in our interest rate.

Mr. ROE. But still it is a 20-, 30-year writeoff for the life of the equipment. OK.

The gentleman from Minnesota?

The gentleman from Oregon.

Mr. SMITH. I want to compliment the gentleman on his testimony and as well the efforts of your company obviously to assist in the cleaning of the waters of Colorado.

My question has to do with your testimony and the statement that you made that in cases you have gone beyond the best available technology, in some cases seven times. If you have gone beyond the best available technology, and I assume that EPA does not demand any more than that, why are you concerned?

Mr. AUSTERMANN. I am concerned because we were not able to meet the water quality standards that apply.

Mr. SMITH. Of Colorado or EPA.

Mr. AUSTERMANN. Of Colorado.

So it required a downgrading.

Mr. SMITH. So that Colorado's laws are more stringent than EPA?

Mr. AUSTERMANN. Yes.

Mr. SMITH. And the problem is that you cannot, even though you have gone beyond EPA standards of best available technology, you cannot qualify in the Colorado situation?

Mr. AUSTERMANN. Well, under Colorado law we were able to. However, under Federal law, once you have classified a stream, it becomes very difficult to downgrade that classification, and so the problem we were facing was Federal restriction on downgrading, notwithstanding the fact that Colorado had adopted water quality standards that were more stringent than EPA required.

Mr. SMITH. OK, and then very quickly, tell me how you would amend the two bills that are before us which would, I assume, eliminate the opportunity for you to downgrade in Colorado.

Mr. AUSTERMANN. To me, the major factor that both of these bills lacked and that EPA regulations currently lacked is that in considering the approvability or disapprovability of a downgrading

action they failed to look at the condition the stream will be in after the downgrading occurs. Now, it seems to me that procedurally this sort of thing could occur in either of two circumstances.

If you looked at section 303 of the act it could occur during a downgrading type of proceeding. If you look at either section 302 or 301(b)(1)(c), depending on how you look at those two sections, it could occur in a variance-type proceeding.

But under the current act, section 301(b)(1)(c) is quite explicit, that after July 1, 1977, your discharge permit must contain limitations that will protect the receiving water quality. No exceptions.

Mr. SMITH. So if I hear you correctly, you are saying that even though Colorado has higher standards than EPA at the moment, and your company has exemplified that, that even with downgrading in Colorado, you would still have higher standards than EPA and best available technology, yet these bills would deprive you of doing that as they are before us.

Mr. AUSTERMANN. I think there is a great danger of that.

Unfortunately, none of these rules are crystal clear.

Mr. ROE. Would the gentleman yield?

Mr. SMITH. Yes, I yield to the Chairman.

Mr. ROE. They did not deprive you from doing that, it is that EPA has not made the decision; is that not correct?

Mr. AUSTERMANN. Yes, as I stated earlier, I think the existing regulations which relate to downgrading are not very clear in their operation. We have not gotten a clear signal from EPA.

Mr. ROE. If the gentleman would yield further.

There is nothing in the law presently that precludes that decision process to be made.

Mr. AUSTERMANN. Not in the law, I agree.

Mr. ROE. OK.

Mr. SMITH. Just point of clarification.

In the two bills there are provisions however that would deprive you of downgrading; is that correct? That is what I thought I heard you say.

Mr. AUSTERMANN. I think in the Senate bill, definitely, yes. In the House bill as it presently stands before you, maybe. Because what you have done is basically take EPA's existing regulations.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. Thank you, Mr. Chairman.

I have been interested in your testimony.

Can you tell me whether or not your company was for or against the Clean Water Act originally set out?

Mr. AUSTERMANN. That was before I was with the company. I really have no idea. I am sorry about this.

Mr. EDGAR. Could I ask you just to speculate in reversing the role and put yourself in a State that does not have high standards for its water. Would not some of the suggestions you are making enable those States to downgrade their water supplies far below national standards?

Mr. AUSTERMANN. Not necessarily. As I said, I believe if you focus in on the quality of the water as it will be after the downgrading occurs, that does not necessarily have to occur.

Mr. EDGAR. Let me ask it another way. What would prevent States from downgrading streams to a very low point in your pro-

posal? What would prevent them from simply saying we agree with you that there ought not to be too strict Federal standards and we are going to downgrade our water supply and allow increased pollution not to praise those companies like yours that have gone to best available technology and more, but we are going to relax our standards.

Mr. AUSTERMANN. If the relaxation would allow the pollution to occur at such levels as public health was in danger, or fish and wildlife would no longer be supported, even though that could be accomplished at reasonable cost, then I believe under my proposal EPA would be free to disapprove that type of action.

Mr. EDGAR. Does not your experience show that when very high water quality goals are set, you can make great progress in cleaning up the water?

Mr. AUSTERMANN. Yes, and I have no objection to setting these very ambitious goals. I think as I stated in my testimony one of the dangers that we have here is that the States may be deterred from setting these goals. I think the problem is that when you translate a goal or a general policy statement into an inflexible rule of substantive law, it becomes very difficult to deal with. I agree with you that when the State of Colorado adopted these very ambitious goals for Ten Mile Creek, which is one of the creeks that we discharge through, it did make us work very hard and spend a lot of money. And I am not objecting to that.

What we need, I think, is the flexibility to deal with the fact that notwithstanding that effort, we were not quite able to attain what the State wanted. We were almost able to attain it but not 100 percent.

Mr. EDGAR. Is not your argument then with the State to modify their restrictions slightly rather than with the Federal Government?

Mr. AUSTERMANN. Well, that is the problem I am addressing. The State agreed to do that. There is a great deal of uncertainty now as to whether the State's action is approvable by EPA because of its restrictions on—they view this action as a downgrading.

Mr. EDGAR. Let me ask you, on page 2 of your attachments I am confused about two provisions. Can you explain what you mean in the middle of page 2 of your attachments where you say, "We suggest language that would limit the definition of navigable waters as follows:"? And then you give a definition, "For purposes of this Act, the term 'navigable waters' shall exclude waters that do not support diversified fish, shellfish or wildlife population, do not provide water to downstream users, do not flow into other water bodies and have a 10-year, 7-day low flow of zero, navigable waters shall be defined as those waters which have as a minimum 6-mile drainage net."

Where did you come up with that definition?

Mr. AUSTERMANN. I believe that this particular language was developed with a group of other companies, primarily from Arizona. We have operations in Arizona, not the division that I work for, in which the climatic conditions are quite a bit different from what they are in Colorado. As I mentioned earlier, we are in a net precipitation area, we get more rain than we have evaporation.

In Arizona the situation is just the opposite. You have a lot more evaporation than you have rain and very often, it is my understanding and I am not personally familiar with these operations, that very often discharges which qualify as point source discharges under existing definitions of the act, basically do not go anywhere. They do not become part of the total drainage net that you are talking about when you refer to navigable waters.

The 10-year, 7-day low flow is a very common hydrologic concept and I think EPA recommends to the States in guidance that water quality standards apply, if you will, down to the 10-year, 7-day low flow. We use that in Colorado. That is the basis upon which discharge permits are written. Your discharge in combination with receiving water quality has to protect water quality standards down to that flow.

In our particular situation in Climax, the 10-year, 7-day low flow is zero even though it is a net precipitation area. The 6-mile drainage net was a recommendation of some hydrologists. I do not know the basis for that. I am not sure if I answered the question.

Mr. EDGAR. I think if you are going to recommend that kind of language you ought to do a comparison then of what that language would mean that is different from the existing language, because I really have some question as to whether, you know, the particulars of that proposed language really do what you suggest that it does without causing some harm.

But, let me go to my final question which is on the last two paragraphs which really kind of disturb me a little bit because I think I understand your intention. But the way you go at it is real troubling:

Wetland protection. During the last decade, the Corps of Engineers dredge and fill jurisdiction has expanded from navigable waters in the United States to include wetlands and those areas adjacent to these waters, then to adjacent tributaries and wetlands and finally to uplands that are wet only part of the time and thus contain wetlands-type vegetation. Often the programs requirements grossly infringe upon personal property rights. Not all wetlands are easily valuable, yet under current definition all wetlands must receive equal protection even if they are areas of farmland:

And so on. Then you say that your suggestion is that acceptable solution to this problem would be to exclude all manmade or unnaturally formed or artificial wetlands from statutory definition.

Can you clarify that for us?

Mr. AUSTERMANN. Well, we have a situation in Colorado, I do not know if you are familiar with the geography out there, but of course it is generally a very arid State except in the mountains where we do get quite a bit of snow. Almost all of the agriculture in Colorado is therefore irrigated, we divert waters from the streams. And in the older farms, particularly in the higher parts of the State, you do not use little sprinklers or anything. What they do is just divert the flow of streams onto these meadows to let the water flow over them.

As a consequence of this practice, which is totally man made, certain types of vegetation which have been defined by the corps, or the Fish and Wildlife Service, to be wetland vegetation have arisen. Of course these are plants that can tolerate seasonally saturated soil. In certain instances the corps has told these farmers

when the land has been taken out of agricultural production for some other type of development, that could either be industrial or in many cases real estate development, that these were wetlands and that development could not occur without informing them.

Mr. EDGAR. I see what you are trying to get at for Colorado but if you follow me for just a second, we made the Erie Canal which is a manmade function, many large lakes that we made that are man made. Would not they qualify as being not under your jurisdiction if you exclude all manmade or unnaturally formed or artificial wetlands?

Mr. AUSTERMANN. As we have fashioned this; yes. I suppose what we have failed to do here is to take into account the purpose for which the man-made wetland was created.

You know, if the wetlands that were created incident to the construction of the Erie Canal, if people desired to leave them in place as habitat, then I think it is perfectly appropriate. But I think in the type of situation that I have been describing, nobody had the slightest idea that that was going to occur. And in fact I am not even sure at the time that debates were occurring initially people realized that this was going to be the effect of the program. I think we had a situation in Gunnison County, which is on the western slope, where the corps drew the wetlands map and I think most of the county, including most of the then-existing town fell within wetlands. It just flabbergasted people.

Mr. EDGAR. Thank you.

Mr. ROE. Mr. Stangeland.

Mr. STANGELAND. It just seems to me that we have to go to a different terminology. I agree with you, but if a State sets substantially higher standards and you find after best effort that you cannot meet those standards, then some reclassification, so long as the standards are equal to or higher than EPA's is needed. If you can find a new phraseology and give the States that flexibility, that is what I think you are asking for.

Mr. AUSTERMANN. Precisely, Congressman.

Mr. STANGELAND. And if that flexibility is not allowed, there are many States who are not going to set those high standards. They are only going to go equal to the Federal and then maybe never ever achieve really what we—what you have achieved in Colorado; is that not correct?

Mr. AUSTERMANN. That is my fear, Congressman, yes.

Mr. STANGELAND. Find a new terminology and we can get the job done.

Mr. AUSTERMANN. We are working hard at it.

Mr. ROE. The gentleman from Samoa, Mr. Sunia.

Mr. SUNIA. No questions.

Mr. ROE. We want to thank you very much, Mr. Austermann, for your testimony and we appreciate your being with us this morning.

Mr. AUSTERMANN. Thank you, Mr. Chairman.

Mr. ROE. Our next witness is Mr. Randolph Goulding, president of Jordan, Jones & Goulding, Atlanta, Ga., and president of the American Consulting Engineers Council.

Mr. Goulding, I want to welcome you again to our committee. The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF THE AMERICAN CONSULTING ENGINEERS COUNCIL

Mr. Chairman, Members of the Subcommittee on Water Resources. My name is Randolph Goulding, President of Jordan, Jones and Goulding in Atlanta, Georgia, and Chairman of the American Consulting Engineers Council's (ACEC) Environmental Committee. We are pleased to present this statement on reauthorization of the Clean Water Act and comments on certain provisions of P.L. 95-217.

ACEC is a national organization of 3,800 private engineering firms. More than 900 of our member firms are actively engaged in the study, design and engineering services during constructon on industrial and municipal wastewater treatment plants. ACEC members have provided engineering for more than 90 percent of the water pollution projects since the Clean Water Act was signed into law in 1972.

Based on that experience we have concluded that fundamental goals of the act are still sound. Considerable progress has been made in cleaning up the rivers streams and coastal waters of the United States. However the second decade of the effort must be directed to completion, refinement and more effective resource management and coordination, mostly at the state and local government level.

Many projects begun in the 70s must be completed in the 80s to achieve water quality goals. This requires that EPA and state regulations remain consistent and predictable, but not cast in stone if water quality and other community goals would be better served by some flexibility.

Refinement of water pollution control strategies will result from the substantial increase in understanding about the sources, fates and interaction of both toxic and conventional pollutants and their impacts on aquatic life. Not only has knowledge increased about these impacts but treatment plant operation and stream segment management has been refined.

Well-run plants are more and more the rule in most communities. The regulators in state environmental agencies are also more professional. But these states to maintain their professional competence must have a predictable source of resources especially as more formerly federal responsibilities are accepted by states. The states cannot do more for less.

Effective resource management and coordination is essential at all levels. To assure that plants continue to operate well requires professionally trained staff and adequate dedicated revenues. Many engineering firms whose practice was limited to design and construction management have now created operating divisons which run treatment plants for municipalities and industry under contract. But financial management is essential too. There is not, and should not be, any long-term federal funding assurance for operations or replacement. The utility-based concept for wastewater treatment must be routinely accepted by communities, as it is for water treatment, electric generation and telephone service.

Not only must O&M be supported by user revenues, but longer term replacement and expansion must be based on a combination of local capital development assistance and private investment, not federal grants. ACEC strongly supports alternative sources of revenue to federal grants. This is a consistent position with our support for the elimination of grants for planning and design in the 1981 amendments.

In November, 1982, ACEC together with 25 other technical professional, water infrastructure, public interest and industrial associations sponsored a National Water Symposium to look at current problems in financing water and wastewater systems, identify new technologies and develop strategies for long term solutions for the maintenance development and expansion of the National water infrastructure. More than 150 professionals participated in strategy workshops and heard from leaders from federal and state water management, the financial community and elected officials at the state and national level on the nation's water problems.

The symposium identified seven proposals which could assist to solve the water infrastructure problems. These proposals included several that impact the Clean Water Act and consideration of resources for achieving wastewater treatment results.

1. Establish and implement a capital budgeting process at all levels of government local, state, federal to provide the framework for a financing mechanism that transcends political timeframes.

2. Assess fees that are sufficient to finance cost of construction operation and maintenance and replacement of the water utility.

3. Reform federal and state laws and regulations to specify results, eliminating time consuming procedural requirements.

4. Designate a specific point in time by which the municipal wastewater treatment works construction grant program will be terminated.

A copy of the Executive Summary of the Symposium's Proceedings is appended to this statement.

In light of these observations and conclusions ACEC presents the following specific comments on issues related to proposed amendments to the Clean Water Act.

A. Authorizations

One of the roles that is best left central with the federal EPA is research. Despite increases in water knowledge over the last decade, refinement of water impacts especially as it relates to toxic chemicals is essential. ACEC strongly supports maintaining the research programs under Section 104 of the law and extension of the authorization at current levels through 1987.

Even more important is the maintenance of federal resources to the states during this period of increasing state acceptance of delegated responsibilities. Therefore ACEC supports the authorization of 106 for state grants at the current level of $75,000,000. The contention that Section 205(j) funds authorized in the 1981 amendments substitute for the proposed reduction of Section 106 in the FY 84 budget to $30 million is not only budgetary slight of hand but false economy.

ACEC also supports the reauthorization of Sections 112; 314c(2) and 517 through 1987.

B. Compliance Dates

ACEC supports the extension of the compliance dates. This is consistent with the necessity for predictable regulatory requirements for industry especially since the BAT regulations are only now being developed and promulgated. ACEC agrees that industry should be held to a three year limit to implement the performance specification once the regulation has been approved in final.

C. Ocean Waiver

ACEC believes that the current provisions of the law relating to special ocean discharge requirements are adequate to resolve this issue and that the requirement of a minimum of primary treatment will impact very few systems. However it is unclear what is meant by "other treatment to control pathogens" in some proposed amendments.

The real issue of ocean waiver is one which Congress created by opening up the eligibility of coastal communities to possible eligibility in the 1981 amendments. This possibility has given many applicants who were on a specific schedule to upgrade their systems an excuse or, at least, a dilemma of whether to proceed or not. The delay will increase the cost of these systems when most are eventually told they must meet secondary standards. It is an example of the kind of change which eliminates consistency and predictability in federal

requirements, except this time it was caused by Congressional action, not EPA or the states. ACEC, however, agrees with proposed language that limits special marine discharge requirements to deep offshore waters, not bays or estuaries.

D. Water Quality Standards

The proposed revision of the Water Quality Standards regulations by EPA has generated much controversy. ACEC has not taken a position on the revision but is looking at it closely. There is no doubt that the designation of uses by state politics and legislative fiat was often based more on a wish, than a reasonable and achievable environmental program. These early 70's use designations often resulted in technology effluent standards and permit limitations that not only were unrealistic but had little impact on total water quality when total discharge volumes were compared with total stream flows. Many states have since reconsidered these effluent limits in light of point source as compared with non-point total loading rates as part of their review of priority stream segments.

Better understanding of effluent limits and their contribution to water quality impacts have also led many states to consider more dynamic criteria for discharge permits, including seasonal variations, timed release and other use related limits. These environmentally sensitive and resource effective management policies allow states to administer priority stream segments based on real water quality considerations not theoretical models, the basis of standards in early federal

criteria. Water quality standards based on actual in-stream sampling is the way Congress intended the standards program to be managed.

Whatever impact the proposed regulatory revisions would have, the suggested amendments to Section 303(c) are not the way to deal with them. Freezing uses as of January 1, 1983, is not selective professional management based on careful state review and intensive water quality monitoring. It is a federal intrusion into the regulatory partnership which the act envisions.

Congressonal oversight of the proposed regulatory revisions is appropriate. But until such time as EPA has reviewed the more than 1,400 comments resulting from 11 public hearings and hundreds of pages of testimony, and has reissued revised regulations, Congressional action on limiting water quality standards flexibility is not appropriate. It is exactly the kind of inconsistency and unpredictability which has bedeviled the water quality improvement program since the law was based in 1972.

E. Pretreatment

ACEC supports and urges the Committee to include in any bill the amendments to the pretreatment sections of the law proposed by the large cities and states to permit a local program under specific conditions. The current program has not worked and has been exceeded in difficulty to promulgate only by the difficulty to implement. Categorical standards

will create standards too rigid in some cities and too lax in others. Many ACEC members have reported that the establishment of a workable effective pretreatment program is often the most frustrating component of designing a modern municipal wastewater treatment system. The proposed changes will allow the assurance of a program of national standards together with the flexibility to permit treatment systems with sufficient capability to adapt the program to local needs. The statement of the Administrator that a program of local flexibility will require EPA resources beyond current capability is an assertion that the agency should be required to justify in specifics.

F. Civil Penalties

No compelling case has been made that administrative penalties available to the administrator have been inadequate or in fact have been appropriately used against polluters, whether municipal or industrial. Since the penalty for deliberate or negligent polluters is currently $25,000/day in the law, it seems inequitable to have a maximum penalty of only $5,000 for permit violation, that is someone who has otherwise done all necessary to be in compliance but has not met the terms of the permit.

ACEC supports firmer enforcement. But better enforcement does not arise from higher penalties. It results from more aggressive environmental compliance policies, and the willingness to use them.

G. Partial NPDES Program Approval

ACEC has consistently supported maximum delegation of management of the Clean Water program to the states. Some states have refused to accept delegation because there are elements of the permit program they are unwilling to undertake. If the partial program will encourage delegation acceptance by more states, then the additional authority in the law to allow partial approval would be valuable and ACEC supports it.

H. Non-Point Sources

The impact of non-point sources on water quality is a fundamental issue to effluent criteria and water quality standards and also must be resolved. But because it is so much more diverse and geographically dispersed, it must be done with incentives rather than sanctions.

I. Common Law Remedies

Amendments proposed to date do not include a section on common law remedies. However, there has been sufficient discussion of such an amendment to warrant comment. Section 509 of the CWA gives adequate cause of action to any citizen for any decision by the Administrator or delegated authority acting for the Administrator. Industries and municipalities need some certainty that compliance with a permit is adequate protection against frivolous suits. The Clean Water Act sets up a system for controlling pollution and a series of interacting administrative authorities for resolving disputes. Bypassing that system by resort to a "federal common law" not

20-955 O—84——84

only subverts the system established by P.L. 92-500 but also diverts resources from pollution control to defense of suits outside the system. ACEC urges the Committee to permit Illinois v. Milwaukee to rest as the Supreme Court decided it and not consider creation of any federal common law remedy.

J. Dredge and Fill Permits (Section 404)

The joint responsibility between EPA and the Army Corps of Engineers to administer permits for dredge and fill projects has caused more delays, cost overruns and inconsistent interpretation of environmental policy than any other section of the clean water act. ACEC supports efforts by the Corps of Engineers to reform the regulatory process for such permits and distinguish between projects of minimal environmental impact and local significance, and those which are of general or national concern. Just as the partnership between EPA, the Corps and the states has evolved, so should the regulatory partnership between the Corps, EPA and the states over such permits. Section 502(7), the definition of navigable waters, needs more specificity than "the waters of the United States".

Section 404, moreover, is not an effective way to protect wetlands. If Congress believes more authority to protect wetlands is needed, it should be done by separate statute.

K. Funding

Since the passage of the 1981 amendments to the CWA reauthorizing the Construction grants program through 1985, there has been much discussion about inadequacy of funding.

Yet the facts are that EPA has enjoyed three on-time appropriations in a row, with the result that obligations are behind past years.

This has been attributed to many factors -- the economy, state priority list revisions, inability to raise local matching funds. Nonetheless, ACEC believes that predictability and consistency are as important in funding as much as regulatory policy. Those that are on current priority lists and allocations schedules know they will receive funding. They also know that if the inflation remains low they will be able to build their system if the funding does not change.

Those that are not on the lists know they must seek other funding sources and our members tell us that many are doing just that. By changing the authorized level of Title II in advance of the expiration we change expectations. Even the hint of the possibility of raised authorizations may cause local elected officials to defer local financing options. Meanwhile, there is no parallel interest by appropriations committees or the Administration to raise the commitment of funds.

This program has experienced far too often the roller coaster funding effect. We urge this Subcommittee to focus on the refinements in Titles III and IV and leave Title II to next year after the completion of pending EPA, GAO and other ongoing studies of the success and future of the program.

We believe the positions are consistent with our criteria for the second decade of water pollution control -- completion, refinement and more effective resource management, particularly at the state and local levels. We appreciate the opportunity to present this statement and would be pleased to answer any questions.

Mr. ROE. Please proceed.

TESTIMONY OF RANDOLPH GOULDING, EXECUTIVE VICE PRESIDENT, JORDAN, JONES & GOULDING, ATLANTA, GA., AND CHAIRMAN, ENVIRONMENTAL COMMITTEE, AMERICAN CONSULTING ENGINEERS COUNCIL, ACCOMPANIED BY LAURENCE D. BORY, DIRECTOR, GOVERNMENTAL AFFAIRS, ACEC

Mr. GOULDING. Mr. Chairman, I do appreciate this opportunity to be with you, and I appreciate the promotion. I am really the executive vice president of the firm of Jordan, Jones & Goulding.

Mr. ROE. Well, we just made you president.

Mr. GOULDING. That is fine. My friend, Charlie Jones, probably would not appreciate that.

I have with me Laurence D. Bory. He is the director of governmental affairs with the American Consulting Engineers Council here in Washington, D.C.

We have filed with your secretary for the record our statement, and this morning I would basically like to highlight some points.

Mr. ROE. No objection, the statement will be included in full in the record.

Mr. GOULDING. The American Consulting Engineers Council is a national organization of some 3,800 private engineering firms. More than 900 of our member firms are actively engaged in the study, design, and engineering services during construction on the industrial and municipal waste water treatment plants.

Considerable progress has been made in cleaning up the rivers, streams, and coastal waters of the United States. However, the second decade of the effort must be directed to completion, refinement, and more effective resource management and coordination, mostly at the State and local government level.

Effective resource management and coordination is essential to all levels. To assure that plants continue to operate well requires professionally trained staff and adequate dedicated revenues. Many engineering firms whose practice was limited to design and construction management have now created operating divisions which run treatment plans for municipalities and industry under contract. But financial management is essential, too. There is not, and should not be, any long-term Federal funding assurance for operations or replacement. The utility-based concept for waste water treatment must be routinely accepted by communities, as it is for water treatment, electric generation, and telephone service.

ACEC strongly supports alternative sources of revenue to Federal grants. This is a consistent position with our support for the elimination of grants for planning and design in the 1981 amendments.

ACEC presents the following specific comments on issues related to proposed amendments to the Clean Water Act.

ACEC strongly supports maintaining the research programs under section 104 of the law and extension of the authorization at current levels through 1987.

ACEC supports the authorization of section 106 for State grants at the current level of $75 million.

ACEC supports the extension of the compliance dates. This is consistent with the necessity for predictable regulatory requirements for industry especially since the BAT regulations are only now being developed and promulgated. ACEC agrees that industry should be held to a 3-year limit to implement the performance specification once the regulation has been approved in final.

ACEC believes that the current provisions of the law relating to special ocean discharge requirements are adequate to resolve this issue.

The real issue of ocean waiver is one which Congress created by opening up the eligibility of coastal communities to possible eligibility in the 1981 amendments. This possibility has given many applicants who were on a specific schedule to upgrade their systems an excuse or, at least, a dilemma of whether to proceed or not. The delay will increase the cost of these systems when most are eventually told they must meet secondary standards. It is an example of the kind of change which eliminates consistency and predictability in Federal requirements, except this time it was caused by congressional action, not EPA or the States. ACEC, however, agrees with proposed language that limits special marine discharge requirements to deep offshore waters, not bays or estuaries.

Better understanding of effluent limits and their contribution to water quality impacts have also led many States to consider more dynamic criteria for discharge permits.

Water quality standards based on actual in-stream sampling is the way Congress intended the standards program to be managed.

Whatever impact the proposed regulatory revisions would have, the suggested amendments to section 303(c) are not the way to deal with them. Freezing uses as of January 1, 1983, is not selective professional management based on careful State review and intensive water quality monitoring. It is a Federal intrusion into the regulatory partnership which the act envisions.

Until such time as EPA has reviewed the more than 1,400 comments resulting from 11 public hearings and hundreds of pages of testimony, and had reissued revised regulations, congressional action on limiting water quality standards flexibility is not appropriate. In this case we understand that EPA and the appropriate congressional committees are nearing an agreement on this particular issue, I think as a result of some of these inputs.

Under the pretreatment section, ACEC supports and urges the committee to include in any bill the amendments to the pretreatment sections of the law proposed by the large cities and States to permit a local program under specific conditions. Categorical standards will create standards too rigid in some cities and too lax in others. The proposed changes will allow the assurance of a program of national standards together with the flexibility to permit treatment systems with sufficient capability to adapt the program to local needs.

On civil penalties, ACEC supports firmer enforcement. But better enforcement does not arise from higher penalties. It results from more aggressive environmental compliance policies, and the willingness to use them.

The impact of nonpoint sources on water quality is a fundamental issue to effluent criteria and water quality standards and also

must be resolved. But because it is so much more diverse and geographically dispersed, it must be done with incentives rather than sanctions.

Amendments proposed to date do not include a section on common law remedies. However, there has been sufficient discussion of such an amendment to warrant comment. The Clean Water Act sets up a system for controlling pollution and a series of interacting administrative authorities for resolving disputes. Bypassing that system by resort to a Federal common law not only subverts the system established by Public Law 92-500 but also diverts resources from pollution control to defense of suits outside the system. ACEC urges the committee to permit *Illinois* v. *Milwaukee* to rest as the Supreme Court decided it and not consider creation of any Federal common law remedy.

On dredge and fill permits, ACEC supports efforts by the Corps of Engineers to reform the regulatory process for such permits and distinguish between projects of minimal environmental impact and local significance, and those which are of general or national concern.

Section 404, moreover, is not an effective way to protect wetlands. If Congress believes more authority to protect wetlands is needed, it should be done by separate statute.

Since the passage of the 1981 amendments to the CWA reauthorizing the construction grants program through 1985, there has been much discussion about inadequacy of funding. Yet the facts are that EPA has enjoyed three on-time appropriations in a row, with the result that obligations are behind past years.

This has been attributed to many factors—the economy, State priority list revisions, inability to raise local matching funds. Nonetheless, ACEC believes that predictability and consistency are as important in funding as much as regulatory policy. Those that are on current priority lists and allocations schedules know they will receive funding. They also know that if the inflation remains low they will be able to build their system if the funding does not change.

Those that are not on the lists know they must seek other funding sources and our members tell us that many are doing just that. By changing the authorized level of title II in advance of the expiration, we change expectations. Even the hint of the possibility of raised authorizations may cause local elected officials to defer local financing options. Meanwhile, there is no parallel interest by Appropriations Committees or the administration to raise the commitment on funds.

This program has experienced far too often the roller coaster funding effect. We urge this subcommittee to focus on the refinements in titles III and IV and leave title II to next year after the completion of pending EPG, GAO, and other ongoing studies of the success and future of the program.

We believe these positions are consistent with our criteria for the second decade of water pollution control—completion, refinement and more effective resource management, particularly at the State and local levels. We appreciate the opportunity to present this statement and would be pleased to answer any questions.

Mr. ROE. We want to thank Mr. Goulding for your splendid testimony. Your organization testified before us before and we appreciated all your help over the years.

I have no questions personally.

The gentleman from Oregon.

Mr. SMITH. Thank you, Mr. Chairman.

Mr. Goulding, in your statement, you express the ACEC's position that industry should have 3 years from the date regulations are promulgated in final form to implement best available technology requirements.

Others have suggested that 3 years from the date of that permit has been issued is a more appropriate time period. Do you want to comment on that?

In other words, it is a question between the time the permit has been issued rather than the regulations are promulgated?

Mr. GOULDING. I think that in either case, you have to give industry the time to do the job. If you are going to tell them that they do not have to perform to BAT standards then it is necessary that they move on and satisfy those requirements. If they are in a situation where their permit is not going to allow them to discharge, it may be better to measure the time from the issuing of the permit.

Mr. SMITH. Obviously that would be a longer time.

Mr. GOULDING. That would be a longer time. This falls into some of our testimony that the States should have some opportunity to review their requirements.

Mr. SMITH. Would you like to respond to that in further order, we will be happy to hear that

Mr. GOULDING. All right.

Mr. BORY. Excuse me, Congressman. Our intention here was to indicate that, based upon the experience of our members working for industry, 3 years is more than an adequate amount of time to respond once a final decision has been made as to what the standards are. We did not distinguish between the regulation and the permit. Some of the proposed amendments talked about 1987 as a final date, and where we felt that the regulation had been issued earlier than 1984, that this should not be an additional amount of time for the industry to say, "Well, now we have till 1987 to comply." We believe they should proceed with all due speed and be required to finish within 3 years or whatever is the appropriate time at which they have the final standards.

Mr. SMITH. All right.

So your choice would be the time that the rules were promulgated in my question?

Mr. BORY. Like the former witness, I am afraid I am going to have to give a lawyer-like answer.

Mr. SMITH. Fine, I would be happy to hear from you, after you have thought about it.

Mr. BORY. We would be happy to submit an additional response, for the record, on that subject. We did not really address that specifically.

[Supplemental questions submitted by Representative Smith and responses received from Mr. Goulding follow:]

ACEC File #700.01
708

american
consulting engineers
council

December 28, 1983

The Honorable Robert Roe
Chairman
Subcommittee on Water Resources
Committee on Public Works and Transportation
U.S. House of Representatives
2243 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Roe:

During the testimony of the American Consulting Engineers Council on November 1, 1983 on the reauthorization of the Clean Water Act, Mr. Smith asked us the following three questions.

1. Does ACEC's support of the extension of compliance deadlines for industrial Best Available Treatment (BAT) relate to completion of the EPA regulations or permits?

2. Can ACEC provide examples of states which established water quality use designations by statute or regulation?

3. Does ACEC support a loan program to replace the existing Construction Grants Program?

ACEC is pleased to respond to these questions and requests that this letter be made part of the hearing record.

1. Compliance Deadlines for BAT

In response to the consent decree in the NRDC case, EPA is currently developing final effluent guidelines for priority toxic pollutants by industry category. It is our understanding that virtually all industries support the three years after regulation compliance requirement. It has been ACEC's experience that planning, designing and constructing of industrial wastewater treatment process facilities can be accomplished far more quickly than municipal plants and within the three year compliance period. ACEC, therefore, supports the compliance schedule of three years after the issuance of final effluent discharge regulations.

2. State Water Quality Use Designations

ACEC was asked to provide additional detail to its statement concerning state legislative and administrative intent in establishing uses as a "wish". We have reviewed the statutes and regulations for states in various parts of the country. We have also conferred with the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). We have discovered that our intent and position on water quality uses was consistent with the position of the states but our choice of words was misleading.

In 1973, following passage of P.L. 92-500 the year before, the states were required to pass conforming legislation to permit them to participate in the funding under the Clean Water Act and to implement the enforcement requirements of law. The Council of State Governments developed a model statute (copy attached) to assist the states in complying with the federal requirements. Included within the General Powers section was a subsection (b):

> To administer and enforce the provisions of this Act and all rules, regulations, and orders effluent limitations water quality standards and permits promulgated, issued and effective hereunder.

In addition the section on Issuance of Permits included language "such discharge meets or will meet all applicable state and federal water quality standards and effluent limitations and all other requirements of this Act." The inclusion of "federal" meant that compliance was required with whichever standard or limitation was more stringent.

Many states passed laws very similar to the model statute. Soon after EPA developed national water quality standards, known often as the Red Book which were incorporated into state regulations in the absence of specific in-stream sampling data on which state standards could be based.

Enclosed is a copy of Florida's water quality standards and Georgia's water quality control regulations and standards. These are the two states which we mentioned in our original testimony. You will note that each state has listed specific stream segments by use of classifications which in turn determine effluent discharge criteria in those segments.

At a minimum these classifications were approximations when first issued. As the states and EPA have learned more about the interaction of pollutants and their impact on aquatic life and human uses, the criteria have been refined and adjusted. The states should have the authority as intended by Congress to make

such adjustments in stream segment classifications as they develop more in-stream studies and learn more about the actual impacts of non-point and point source discharges.

We reiterate our support for existing law and the water quality use regulations recently revised by EPA, to protect streams, while giving the states the flexibility to adjust standards.

3. ACEC position on a loan program to replace the existing grants program.

ACEC has supported reduced federal assistance for federal domestic programs. We supported the 1981 budget reductions; we supported the 1981 tax amendments, as an incentive to privatization. In 1981 we also supported reduction of the Construction Grants Program to $2.4 billion, elimination of federal funding for wastewater treatment, planning and design, and reduction of the federal share to 55 percent on such grants.

ACEC has, moreover, urged the House and Senate Public Works Committees to increase the local cost sharing for directly funded federal water projects.

The experience of our members has been that federal funding tends to increase the cost of projects, increase standards or design criteria, increase time of completion, increase non-construction requirements such as social objectives, auditing and selection, far beyond what occurs on similar projects that are non-federally funded. Stated succinctly, projects with federal dollars have many more federal strings. These strings have a high price--higher cost, delays, more regulations, more pollution entering the nation's waters.

From an economic point of view, ACEC and its members are also concerned that in a deficit economy additional public works federal expenditures increase the cost of local public and private borrowing for capital projects because of federal competition for borrowing in the capital market. In the last quarter of 1983, the U.S. government borrowed more than $65 billion to repay short term obligations as well as retire long-term bonds. This federal presence in the capital market does not encouarge local public works investment, since it tends to drive up interest rates on local bonds and other long-term investment.

The increased costs of grants, however, are not so high to discourage localities to refuse federal assistance. There are some which have done so, but they are relatively few. Without greater incentives, the difficulty, both economic and political, for local elected officials to choose to finance an investment as

great as a wastewater treatment system is insurmountable. Much of the reason, we believe, is access to capital at reasonable interest rates.

In November, the ACEC Governmental Affairs Committee reviewed the question of grants versus loans. Based on past positions, the Committee agreed that direct federal or federally guaranteed loans in replacment of grants are consistent with ACEC's goals of reduced project cost, delays and requirements. Any loan program, however, must be based on the following assumptions to get ACEC support.

1. A loan program would not increase total federal cost liability beyond current authorized levels.

2. Loans would encourage greater non-federal capital participation in projects.

3. Project costs, delays and federal requirements would be reduced and greater local initiative, responsibility and judgement would result.

4. Reliance on the private sector for technical, financial, and managerial services in the planning, design and construction and even perhaps operation of wastewater treatment plants would be increased.

5. A loan program would encourage continuity of current efforts under the authorized grant program and would expand predictability and consistency so that long-term local plans would continue. This means that a loan program if authorized would not take effect until after the current grant authorization ends in 1985.

Thank you for the opportunity to provide the Committee with this clarification and expansion of our testimony.

Sincerely yours,

Randolph Goulding

Randolph Goulding
Chairman
ACEC Environmental
Committee

Enclosure
cc: The Honorable Robert F. Smith

FLORIDA WATER QUALITY STANDARDS

(Florida Rules of the Department of Environmental Regulation, Chapter 17-3 — Water Quality Standards; Adopted October 28, 1970; Amended March 4, 1971; June 10, 1972; August 30, 1972; June 3, 1973; February 12, 1975; August 26, 1975; June 10, 1976; July 13, 1978; October 28, 1978; January 1, 1979; March 1, 1979; March 5, 1980; August 10, 1980; October 2, 1980; July 27, 1981)

CONTENTS

Part I — Declaration and Intent
Part II — Definitions
Part III — Water Quality Criteria

PART I. DECLARATION AND INTENT

17-3.011 FINDINGS, DECLARATION AND INTENT

(1) Article II, Section 7 of the Florida Constitution requires abatement of water pollution, and conservation and protection of Florida's natural resources and scenic beauty.

(2) Section 403.021, Florida Statutes, declares that the public policy of the state is to conserve the waters of the state and to protect, maintain, and improve the quality thereof for public water supplies, for the propagation of wildlife, fish and other aquatic life, and for domestic, agricultural, industrial, recreational, and other beneficial uses. It also prohibits the discharge of wastes into Florida waters without treatment necessary to protect those beneficial uses of the waters.

(3) Congress, in Section 101(a)(2) of the Federal Water Pollution Control Act, as amended, declares that achievement by July 1, 1983, of water quality sufficient for the protection and propagation of fish, shellfish, and wildlife, as well as for recreation in and on the water, is an interim goal to be sought wherever attainable. Congress further states, in Section 101(a)(3), that it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited.

(4) The present and future most beneficial uses of all waters of the State have been designated by the Department by means of the classification system set forth in this Chapter pursuant to 403.061(12), F.S. Water quality standards are established by the Department to protect these designated uses.

(5) Pollution which causes or contributes to new violations of water quality standards or to continuation of existing violations is harmful to the waters of this state and shall not be allowed.

(6) The quality of water which exceeds the minimum quality necessary to support the designated use of those waters shall be protected and enhanced.

(7) The quality of waters which is lower than that necessary to support the designated use of those waters shall be protected and enhanced provided, however, the Department shall not strive to abate natural conditions.

(8) The highest protection shall be afforded to Outstanding Florida Waters.

(9) Because activities outside the State sometimes cause pollution of Florida's waters, the Department will make every reasonable effort to have such pollution abated.

(10) Water quality standards apply equally to and shall be uniformly enforced in both the public and private sector.

(11) The Department finds that excessive nutrients (total nitrogen and total phosphorus) constitute one of the most severe water quality problems facing the state. It shall be the Department policy to limit the introduction of man-induced nutrients into waters of the State. Particular consideration shall be given to the protection from further nutrient enrichment of waters which are presently high in nutrient concentrations and sensitive to further nutrient loadings. Also, particular consideration shall be given to the protection from nutrient enrichment of those waters presently containing very low nutrient concentrations less than 0.3 milligrams per litre (mg/l) total nitrogen or less than 0.04 milligrams per litre (mg/l) total phosphorus.

(12) Public interest shall not be construed to mean only those activities conducted solely to provide facilities or benefits to the general public. Private activities conducted for private purposes may also be in the public interest.

(13) The Commission, recognizing the complexity of water quality management and the necessity to temper regulatory actions with the realities of technological progress and the social and economic wellbeing of peoples, urges, however, that there be no compromise where pollutional discharges constitute a valid hazard to human health.

(14) The Commission requests that the Secretary seek and use the best environmental information available when making decisions on the effects of chronically and acutely toxic substances and carcinogenic, mutagenic, and teratogenic substances. Additionally, the Secretary is requested to seek and encourage innovative research and developments in waste treatment alternatives that might better preserve environmental quality and/or at the same time reduce the energy and dollar costs of operation.

(15) The present and future most beneficial uses of groundwaters of the State shall be protected to insure the availability and utility of this invaluable resource. To achieve such protection, the groundwaters of the State are classified for the first time and appropriate specific water quality criteria for those classes are set forth in this Chapter.

(16) The criteria set forth in this Chapter are minimum levels which are necessary to protect the designated uses of a water body. It is the intent of this Commission that permit applicants should not be penalized due to a low detection limit associated with any specific criteria.

(17) In adoption of the Outstanding Florida Waters designated on July 13, 1978, the Commission has been assured by the Secretary that adequate public notice has been given that these waters were being considered for this designation and that public comment was solicited and considered in determining their designation.

(18) (a) The revisions made to Chapters 17-3 and 17-4 and the adoption of Chapter 17-6, F.A.C., are designed to protect the public health or welfare and to enhance the quality of waters of the State. They have been established taking into consideration the use and value of waters of the State for public water supplies, propagation of fish and wildlife, recreational purposes, and agricultural, industrial, and other purposes, and also taking into consideration their use and value for navigation.

(b) Under the approach taken in the formulation of the rules adopted in this proceeding:

1. These revisions to Chapters 17-3, 17-4 and adoption of Chapter 17-6, F.A.C., are based upon the best scientific knowledge related to the protection of the various designated uses of waters of the state; and,

2. The mixing zone, zone of discharge, exception, exemption, and equitable allocation provisions are designed to provide an opportunity for the future consideration of factors relating to localized situations which could not adequately be addressed in this proceeding, including economic and social consequences, attainability, irretrievable conditions, natural background, and detectability.

(c) This is an even-handed and balanced approach to attainment of water quality objectives. The Commission has specifically recognized that the social, economic and environmental costs may, under certain special circumstances, outweigh the social, economic and environmental benefits if the numerical criteria are enforced statewide. It is for that reason that the Commission has provided for mixing zones, zones of discharge, exceptions, exemptions and other provisions in Chapters 17-3, 17-4, and 17-6. Furthermore, the continued availability of the moderating provisions is a vital factor providing a basis for the Commission's determination that water quality standards applicable to water classes in the rule are attainable taking into consideration environmental, technological, social, economic and institutional factors. The companion provisions of Chapters 17-4 and 17-6 approved simultaneously with these Water Quality Standards are incorporated herein by reference as a substantive part of the State's comprehensive program for the control, abatement and prevention of water pollution.

(d) Without the moderating provisions described in (b)2 above, the Commission would not have adopted the revisions described in (b)1 above nor determined that they are attainable as generally applicable water quality standards.

PART II DEFINITIONS

17-3.021 DEFINITIONS

(1) "Acute Toxicity" shall mean the presence of one or more substances or characteristics or components of substances in amounts which:

(a) are greater than one-third (1/3) of the amount lethal to 50% of the test organisms in 96 hours (96 hr LC_{50}) where the 96 hr LC_{50} is the lowest value which has been determined for a species significant to the indigenous aquatic community; or

(b) may reasonably be expected, based upon evaluation by generally accepted scientific methods, to produce effects equal to those of the concentration of the substance specified in (a) above.

(2) "Background" shall mean the condition of waters in the absence of the activity or discharge under consideration, based on the best scientific information available to the Department.

(3) "Chronic Toxicity" shall mean the presence of one or more substances or characteristics or components of substances in amounts which:

(a) are greater than one-twentieth (1/20) of the amount lethal to 50% of the test organisms in 96 hours (96 hr LC_{50}) where the 96 hr LC_{50} is the lowest value which has been determined for a species significant to the indigenous aquatic community; or

(b) may reasonably be expected, based upon evaluation by generally accepted scientific methods, to produce effects equal to those of the concentration of the substance specified in (a) above.

(4) "Commission" shall mean the Environmental Regulation Commission.

(5) "Compensation Point for Photosynthetic Activity" shall mean the depth at which one percent of the light intensity at the surface remains unabsorbed. This depth shall be computed as two divided by the extinction coefficient.

(6) "Department" shall mean the Department of Environmental Regulation.

(7) "Designated Use" shall mean the present and future most beneficial use of a body of water as designated by the Environmental Regulation Commission by means of the classification system contained in this Chapter.

(8) "Dominance" shall mean the presence of species or communities in greater numbers, biomass, or areal extent than competing species or communities, or a scientifically accepted tendency of species or communities to achieve such a status under existing or reasonably anticipated conditions.

(9) "Effluent Limitation" shall mean any restriction established by the Department on quantities, rates or concentrations of chemical, physical, biological or other constituents which are discharged from sources into waters of the state.

(10) "Exceptional Ecological Significance" shall mean that a water body is a part of an ecosystem of unusual value. The exceptional significance may be in unusual species, productivity, diversity, ecological relationships, ambient water quality, scientific or educational interest, or in other aspects of the ecosystem's setting or processes.

(11) "Exceptional Recreational Significance" shall mean unusual value as a resource for outdoor recreation activities. Outdoor recreation activities include, but are not limited to, fishing, boating, canoeing, water skiing, swimming, scuba diving, and nature observation. The exceptional significance may be in the intensity of present recreational usage, an unusual quality of recreational experience, or possessing a potential for unusual future recreational use or experience.

(12) "Extinction Coefficient" shall mean: $(1/D) \log 10 (S_0/S_D)$ where D is the length of the light path, S_0 is the light intensity at the surface or the transmission value of light through a distilled or deionized water sample of thickness D, and S_D is the light intensity at depth D or the transmission value of light through a sample of the water tested of thickness D. Light intensities or transmission values shall be measured using a cadmium sulfide photoreceptor or other device having a comparable spectral response.

(13) "Groundwater" means water beneath the surface of the ground, whether or not flowing through known and definite channels.

(14) "Natural Background" shall mean the condition of waters in the absence of man-induced alterations based on the best scientific information available to the Department.

(15) "Nuisance Species" shall mean species of flora or fauna whose presence in sufficient number, biomass, or areal extent may reasonably be expected to prevent, or unreasonably interfere with, a designated use of those waters.

(16) "Nursery Area of Indigenous Aquatic Life" shall mean any bed of the following aquatic plants, either in monoculture or mixed: Haloduie spp., Halephila Engelmannii, Potamogeton spp., (pondweed), Ruppia maritima, (widgeon-grass), Sagittaria spp. (arrowhead), Syringodium filiforme, (manatee-grass), Thallasia testudinum (turtle grass), or Vallisneria spp., (eel-grass), or any area used by the early-life stages, larvae and post-larvae, of aquatic life during the period of rapid growth and development into the juvenile stages.

(17) "Pollution" shall mean the presence in the outdoor atmosphere or waters of the state of any substances, contaminants, noise, or man-made or man-induced alteration of the chemical, physical, biological or radiological integrity of air or water in quantities or levels which are or may be potentially harmful or injurious to human health or welfare, animal or plant life, or property, including outdoor recreation.

(18) "Predominantly Fresh Waters" shall mean those surface waters in which the specific conductance of the water at the surface is less than 5,000 micromhos per centimeter.

(19) "Predominantly Marine Waters" shall mean those surface waters in which the specific conductance of the water at the surface is greater than or equal to 5,000 micromhos per centimeter.

(20) "Propagation" shall mean reproduction sufficient to maintain the species' role in its respective ecological community.

(21) "Secondary and Tertiary Canals" shall mean any wholly artificial canal or ditch which is behind a control structure and which is part of a water control system that is connected to the works (set forth in Section 373.086, F.S.) of a water management district created under Section 373.069, F.S., and that is permitted by such water management district pursuant to Section 373.103, Section 373.412, or Section 373.416, F.S.

(22) "Secretary" shall mean the Secretary of the Department of Environmental Regulation.

(23) "Shannon-Weaver Diversity Index" shall mean: negative summation (i-1 to S) of $(n/N) \log (N/N)$ where S is the number of species in a sample, N is the total number of individuals in species i.

(24) "Special Waters" shall mean water bodies designated in accordance with 17-3.041 by the Environmental Regulation Commission for inclusion in the Special Waters Category of Outstanding Florida Waters, as contained in Section 17-3.041, Florida Administrative Code. A Special Water may include all or part of any water body.

(25) "Surface Water" means water upon the surface of the earth, whether contained in bounds created naturally or artificially or diffused. Water from natural springs shall be classified as surface water when it exits from the spring onto the earth's surface.

(26) "Waters" shall be as defined in Section 403.031(3), Florida Statutes.

(27) "Zone of Discharge" shall mean a volume underlying or surrounding the point of discharge within which an opportunity for the treatment, mixture or dispersion of wastes into receiving groundwaters has been afforded.

(28) "Zone of Mixing" shall mean a volume of surface water containing the point or area of discharge and within which an opportunity for the mixture of wastes with receiving surface waters has been afforded.

PART III WATER QUALITY CRITERIA

17-3.031 EXCEPTIONS FROM CRITERIA

(1) Upon petition of an affected person, permit or upon the initiation of the Department, applicant, after public notice and public hearing, and upon affirmative demonstration that, due to man-induced causes which cannot be controlled or abated with technology or management practices including zero discharge, or due

to natural causes, certain delineated portions of waters of the State do not meet particular water quality criteria contained in this Chapter, the Secretary may issue an order specifying an alternative ambient water quality criterion for each parameter and the portion of the waters for which such demonstration has been made.

(2) The petitioner shall affirmatively demonstrate those standards which the petitioner believes more appropriately apply to the waters for which the exception is sought, based upon relevant factors which include, but are not limited to, the designated use of the waters, the extent to which biota have adapted to the background, evidence regarding ecological stress, and adverse impacts on adjoining waters.

(3) The Secretary shall specify, by order, only those criteria which the Secretary determines to have been demonstrated by the preponderance of competent substantial evidence to be more appropriate.

(4) The Department shall modify permits of existing sources affected by the exception in a manner consistent with the Secretary's Order.

(5) Additional relief from criteria established by this Chapter may be provided through exemption pursuant to Section 17-4.243, Florida Administrative Code, or variances as provided for by Section 17-1.57, Florida Administrative Code.

17-3.041 SPECIAL PROTECTION, OUTSTANDING FLORIDA WATERS

(1) It shall be the Department policy to afford the highest protection to Outstanding Florida Waters (a complete listing of which is provided in subsection (3)) which generally include the following surface waters:

(a) waters in National Parks, Wildlife Refuges, and Wilderness Areas; and

(b) waters in the State Park System and Wilderness Areas; and

(c) waters in Environmentally Endangered Lands which have been acquired under Chapter 259, Florida Statutes; and

(d) rivers designated under the Florida Scenic and Wild Rivers Program or the National Wild and Scenic Rivers Act; and

(e) waters within National Seashores, National Marine Sanctuaries, National Estuarine Sanctuaries, and certain National Monuments; and

(f) waters in Aquatic Preserves, created under the provisions of Chapter 258, Florida Statutes; and

(g) waters within the Big Cypress National Freshwater preserve; and

(h) Special Waters as listed in 17-3.041(3)(g).

(2) Each water body demonstrated to be of exceptional recreational or ecological significance may be designated as a Special Water. The following procedure shall be used in designating a Special Water after the adoption of this rule:

(a) Rulemaking procedures pursuant to Chapter 120, F.S., and Chapter 17-1 shall be followed;

(b) At least one fact-finding workshop shall be held in the affected area;

(c) All local county or municipal governments and state legislators whose districts or jurisdictions include all or part of a special water shall be notified at least 60 days prior to the workshop in writing by the Secretary;

(d) A prominent public notice shall be placed in a newspaper of general circulation in the area of the proposed Special Water at least 60 days prior to the workshop;

(e) An economic impact analysis, consistent with Chapter 120, shall be prepared which provides a general analysis of the impact on growth and development including such factors as impacts on planned or potential industrial, agricultural, or other development or expansion; and

(f) The Commission may designate a water of the State as a Special Water after making a finding that the waters are of exceptional recreational or ecological significance and a finding that the environmental, social, and economic benefits of the action outweigh the environmental, social, and economic costs.

(3) The policy of this section shall be implemented through the permitting process pursuant to Section 17-4.242.

(4) Outstanding Florida Waters:

(a) Waters within National Parks

National Park — County

Everglades — Monroe/Dade/Collier

(b) Waters within Wildlife Refuges

Wildlife Refuge — County

Loxahatchee — Palm Beach
Pig Island — Gulf
St. Vicent — Franklin
Chassahowitzka — Citrus/Hernando
Anclote — Pasco
Pinellas — Pinellas
Okeefenokee (Florida Portion) — Baker
Anclote Island — Indian River
Pelican Island — Indian River
Hobe Sound — Martin
Passage Key — Manatee
Caloosahatchee — Lee
Lake Woodruff — Volusia
St. Mark's — Jefferson/Wakulla
National Key Deer — Monroe
Great White Heron — Monroe
Key West — Monroe
Pine Island — Lee
Matlacha Pass — Lee
J. N. "Ding" Darling — Lee
Island Bay — Charlotte
Cedar Keys — Levy
Chinsegut — Hernando
Merritt Island — Volusia/Brevard
Egmont Key — Pinellas
St. John's — Brevard

(c) Waters within State Parks or Recreation Areas

State Park or Recreation Area — County

Alfred B. Maclay State Ornamental Garden — Leon
Anastasia State Recreation Area — St. John's

State Park or Recreation Area — County

Bahia Honda State Recreation Area — Monroe
Basin Bayou State Recreation Area — Walton
Bill Baggs Cape Florida State Recreation Area — Dade
Blackwater River State Park — Santa Rosa
Blue Springs State Recreation Area — Volusia
Caladesi Island State Park — Pinellas
Chekika State Recreation Area — Dade
Collier-Seminole State Park — Collier
Dead Lakes State Recreation Area — Gulf
Eden State Ornamental Garden — Walton
Falling Waters State Recreation Area — Washington
Faver-Dykes State Park — St. John's
Flagler Beach State Recreation Area — Flagler
Florida Caverns State Park — Jackson
Fort Clinch State Park — Nassau
Fort Pickens State Park — Escambia
Fred Gannon Rocky Bayou State Recreation Area — Okaloosa
Grayton Beach State Recreation Area — Walton
Highlands Hammock State Park — Highlands/Hardee
Hillsborough River State Park — Hillsborough
Hontoon Island State Park — Volusia/Lake
Hugh Taylor Birch State Recreation Area — Broward
Ichetucknee Springs State Park — Columbia/Swuannees
John Pennekamp Coral Reef State Park — Monroe
John U. Lloyd Beach State Recreation Area — Broward
Jonathan Dickinson State Park — Martin
Lake Griffin State Recreation Area — Lake
Lake Kissimmee — Polk
Little Talbot Island State Park — Duval
Long Key State Recreation Area — Monroe
Manatee Springs State Park — Levy
Mike Roess Gold Head Branch State Park — Clay
Myakka River State Park — Manatee/Sarasota
Ochlockonee River State Park — Wakulla
O'Leno State Park — Alachua/Columbia
Oscar Scherer Recreation Area — Sarasota
Pahokee State Recreation Area — Palm Beach
Pepper Park State Recreation Area — St. Lucie
Ponce de Leon Springs State Recreation Area — Holmes/Walton
Ravine State Ornamental Garden — Putnam
St. Andrews State Recreation Area — Bay
Sebastian Inlet State Recreation Area — Hamilton/Madison/Swuannee
Three Rivers State Recreation Area — Jackson
T.H. Stone Memorial St. Joseph Peninsula State Park — Gulf
Tomoka State Park — Volusia
Torreya State Park — Liberty
Washington Oaks State Ornamental Garden — Flagler
Wekiva Springs State Park — Orange/Seminole

(d) Waters within Environmentally Endangered Lands which have been Purchased by the State

Environmentally Endangered Lands — County

Weedon Island — Pinellas
Fakahatchee Strand/Big Cypress Bend — Collier
Volusia Recharge Area — Volusia
River Rise (McLeod Ranch) — Osceola

Environmentally Endangered Lands — County

San Felasco Hammock — Alachua
Three Lakes Ranch — Osceola
Lower Apalachiocola River Tracts — Franklin/Gulf
Palm Beach County Everglades Tract — Palm Beach
Paynes Prairie State Preserve Addition — Alachua
Lower Wekiva River Corridor — Lake/Seminole
Cayo Costa North Captiva Islands — Lee
Charlotte Harbor — Charlotte
Big Cypress National Preserve — Collier/Dade/Monroe
Tosahatchee State Preserve — Orange

(e) Waters Within National Seashores

National Seashores — County

Gulf Islands — Escambia/Santa Rosa
Canaveral — Brevard/Volusia

(f) Water Within State Aquatic Preserves

Aquatic Preserves — County

Cape Romano — Ten Thousand Islands — Collier
Nassau River — St. Johns River Marshes — Nassau/Duval
St. Joseph Bay — Gulf
Apalachicola Bay — Franklin
North Fork, St. Lucie — St. Lucie/Martin
Intracoastal Waters-Jensen Beach to Jupiter Inlet — Martin/Palm Beach
Loxahatchee River — Lake Worth Creek — Martin/Palm Beach
Fort Clinch State Park — Nassau
Cockroach Bay — Hillsborough
Boca Ciega Bay — Pinellas
Caladesi Island — Pinellas
St. Martin's Marsh — Citrus
Alligator Harbor — Franklin
Biscayne Bay — Dade/Monroe
Estero Bay — Lee
Pellicer Creek — St. John's/Flagler
Tomoka Marsh — Volusia/Flagler
Compon Bight — Monroe
Lignumvitae Key — Monroe
Cape Haze — Gasparilla Sound — Charlotte/Lee
Pine Island Sound — Lee
Matlacha Pass — Lee
Yellow River Marsh — Santa Rosa
Fort Pickens State Park — Escambia
Lake Jackson — Leon
St. Andrew's State Park — Bay
Rocky Bayou State Park — Okaloosa
Mosquito Lagoon — Volusia/Brevard
Banana River — Brevard
Indian River Malabar to Sebastian — Brehard/Indian River
Indian River Vero Beach to Ft. Pierce — Indian River/St. Lucie
Pinellas County — Pinellas

(g) Special Waters

Special Water

Ochlockonee River
Wakulla River

St. Mark's River — except that part between Rattlesnake Branch and the confluence of the St. Mark's and Wakulla Rivers.
Wacissa River
Aucilla River
Apalachicola River south of northern Gulf County Line
Chipola River
Shoal River
Choctawhatchee River
Blackwater River
Perdido River
Suwannee River

(h) Waters Within National Monuments

National Monuments — County

Biscayne — Dade

(i) Waters Within National Marine Sanctuaries

Marine Sanctuaries — County

Key Largo Coral Reef — Dade

(j) Waters Within National Estuarine Sanctuaries

National Estuarine Sanctuaries — County

Rookery Bay — Collier County

17-3.05 THERMAL SURFACE WATER CRITERIA

(1) All discharges or proposed discharges of heated water into receiving bodies of water (RBW) which are controlled by the state shall be subjected to a thorough study to assess the consequences of the discharge upon the environment. The state shall be divided into two general climatological zones: Peninsular Florida, which varies from tropical in nature to temperate but is modified by the peninsular configuration and is the area south of latitude 30 degrees N (excluding Gulf and Franklin Counties); and Northern Florida which is temperate and continental and is the area above latitude 30 degrees N plus the portions of Guld and Franklin Counties which lie below 30 degrees N.

(a) Heated water discharges existing on July 1, 1972:

1. Shall not increase the temperature of the RBW so as to cause substantial damage or harm to the aquatic life or vegetation therein or interfere with beneficial uses assigned to the RBW.

2. Shall be monitored by the discharge to ensure compliance with this rule, and

3. If the Department, pursuant to notice and opportunity for hearing, finds by preponderant evidence that a discharge has caused substantial damage, it may require conversion of such discharge to offstream cooling or approved alternate methods. In making determinations regarding such conversions, the Department may consider:

a. The nature and extent of the existing damage;

b. The projected lifetime of the existing discharge;

c. Any adverse economic and environmental (including non-water quality) impacts which would result from such conversion, and

d. Such other factors as may be appropriate.

(b) Heated water sources proposed for future discharges into RBW controlled by the state shall not increase the water temperature by more than the monthly temperature limits prescribed for the particular type and location of the RBW. New sources shall include all expansions, modifications, alterations, replacements, or repairs which result in an increased output of ten percent (10%) or more of the level of energy production which existed on the date this rule became effective. Water temperatures shall be measured by procedures approved by the Florida Department of Pollution Control (DPC). In all cases where a temperature rise above ambient is allowed and a maximum RBW temperature is also prescribed, the lower of the two limitations shall be the control temperature.

(c) Definitions.

(i) Ambient (natural) temperature of a RBW is the existing temperature of the receiving water at a location which is unaffected by manmade thermal discharges and a location which is also of a depth and exposure to winds and currents which typify the most environmentally stable portions of the RBW.

(ii) Coastal waters shall be all waters in the state which are not classified as fresh waters or as open waters.

(iii) A cooling pond is a body of water enclosed by natural or constructed restraints which has been approved by the Florida DPC for purposes of controlling heat dissipation from thermal discharges.

(iv) An existing heat source is any thermal discharge (a) which is presently taking place, or (b) which is under construction or for which a construction or operating permit has been issued prior to the effective date of this rule.

(v) Fresh waters shall be all waters of the state which are contained in lakes and ponds, or are in flowing streams above the zone in which tidal actions influence the salinity of the water and where the concentration of chloride ions is normally less than 1500 mg/l.

(vi) Open waters shall be waters in the state extending seaward from the most seaward 18-foot depth contour line (three-fathom bottom depth contour) which is offshore from any island; exposed or submerged bar or reef, or mouth of any embayment or estuary which is narrowed by headlands. Contour lines shall be determined from Coast and Geodetic Survey Charts.

(vii) The point of discharge (POD) for a heated water dicharge shall be primarily that point at which the effluent physically leaves its carrying conduit (open or closed), and discharges into the waters of the state, or, in the event it is not practicable to measure temperature at the end of the discharge conduit, a specific point designated by the Florida Department of Pollution Control for that particular thermal discharge.

(viii) Heated water discharges are the effluents from commercial or industrial activities or processes in which water is used for the purpose of transporting waste heat, and which constitute heat sources of one million British Thermal Units per hour (1,000,000 BTU/HR.), or greater.

(ix) Blowdown shall mean the minimum discharge of recirculating cooling water for the purpose of discharging materials contained in the water, the further buildup of

20-955 O—84——85

which would cause concentrations in amounts exceeding limits established by best engineering practice.

(x) Recirculating cooling water shall mean water which is used for the purpose of removing waste heat and then passed through a cooling system for the purpose of removing such heat from the water and then, except for blowdown, is used again to remove waste heat.

(d) Monthly and Maximum Temperature Limits

(i) Fresh Waters — Heated water with a temperature at the POD more than 5 degrees F higher than the ambient (natural) temperature of any stream shall not be discharged into such stream. At all times under all conditions of stream flow the discharge temperature shall be controlled so that at least two-thirds (2/3) of the width of the stream's surface remains at ambient (natural) temperature. Further, no more than one-fourth (1/4) of the cross-section of the stream at a traverse perpendicular to the flow shall be heated by the discharge. Heated water with a temperature at the POD more than 3 degrees F higher than the ambient (natural) temperature of any lake or reservior shall not be discharged into such lake or reservoir. Further, no heated water with a temperature above 90 degrees F shall be discharged into any fresh waters in Northern Florida regardless of the ambient temperature of the RBW. In Peninsular Florida, heated waters above 92 degrees F shall not be discharged into fresh waters.

(ii) Coastal Waters — Heated water with a temperature at the POD more than 2 degrees F higher than the ambient (natural) temperature of the RBW shall not be discharged into coastal waters in any zone during the months of June, July, August, and September. During the remainder of the year, heated water with a temperature at the POD more than 4 degrees F higher than the ambient (natural) temperature of the RBW shall not be discharged into coastal waters in any zone. In addition, during June, July, August, and September, no heated water with a temperature above 92 degrees F shall be discharged into coastal waters. Further, no heated water with a temperature above 90 degrees F shall be discharged into coastal waters during the period October thru May.

(iii) Open Waters — Heated water with a temperature at the POD up to 17 degrees F above ambient (natural) temperature of the RBW may be discharged from an open or closed conduit into open waters under the following restraints: The surface temperature of the RBW shall not be raised to more than 97 degrees F and the POD must be sufficient distance offshore to ensure that the adjacent coastal waters are not heated beyond the temperatures permitted in such waters.

(iv) Cooling Ponds — The temperature for heated water discharged from a cooling pond shall be measured at the POD from the pond, and the temperature limitation shall be that specified for the RBW.

(e) General.

(i) Daily seasonal temperature variations that were normal to the RBW before the addition of heat from other than natural causes shall be maintained.

(ii) Recapitulation of temperature limitations prescribed above:

ZONE	STREAMS	LAKES	COASTAL		OPEN
			SUMMER	REMAINDER	
NORTH.	90°F Max. AM +5°F	90°F Max. AM +3°F	92°F. Max. AM +2°F	90°F Max. AM +4°F	97°F Max. AM +17°
PENIN.	92°F Max AM +5°F	92°F Max. AM +3°F	92°F Max. AM +2°F	90°F Max. AM +4°F.	97°F Max. AM +17°F

(f) Upon application on a case by case basis, the Department may establish a zone of mixing beyond the POD to afford a reasonable opportunity for dilution and mixture of heated water discharges with the RBW, in the following manner:

(i) Zones of mixing for thermal discharges from non-recirculated cooling water systems and process water systems of new sources shall be allowed if supported by a demonstration, as provided in section 316(a), Public Law 92-500 and regulations promulgated thereunder, including 40 C.F.R. Part 122, by an applicant that the proposed mixing zone will assure the protection and propagation of a balanced, indigenous population of shellfish, fish, and wildlife in and on the body of water into which the discharge is to be made and such demonstration has not been rebutted. It is the intent of the board that to the extent practicable, proceedings under this provision should be conducted jointly with proceedings before the federal government under section 316(a), Public Law 92-500.

(ii) Zones of mixing for blowdown discharges from recirculated cooling water systems, and for discharges from non-recirculated cooling water systems of existing sources, shall be established on the basis of the physical and biological characteristics of the RBW.

(iii) When a zone of mixing is established pursuant to this subsection 17-3.05(1)(f), Florida Administrative Code, any otherwise applicable temperature limitations contained in section 17-3.05(1), Florida Administrative Code, shall be met at its boundary; however, the Department may also establish maximum numerical temperature limits to be measured at the POD and to be used in lieu of the general temperature limits in section 17-3.05(1), Florida Administrative Code, to determine compliance by the discharge with the established mixing zone and the temperature limits in section 17-3.05(1), Florida Administrative Code.

17-3.051 MINIMUM CRITERIA FOR ALL WATERS AT ALL TIMES AND ALL PLACES

All waters of the State shall at all places and at all times be free from:

(1) Domestic, industrial, agricultural, or other man-induced non-thermal components of discharges which,

alone or in combination with other substances or in combination with other components of discharges (whether thermal or non-thermal):

(a) Settle to form putrescent deposits or otherwise create a nuisance; or

(b) Float as debris, scum, oil, or other matter in such amounts as to form nuisances; or

(c) Produce color, odor, taste, turbidity, or other conditions in such degree as to create a nuisance; or

(d) Are acutely toxic; or

(e) Are present in concentrations which are carcinogenic, mutagenic, or teratogenic to human beings or to significant, locally occurring, wildlife or aquatic species; or

(f) Pose a serious danger to the public health, safety, or welfare.

(2) Thermal components of discharges which, alone, or in combination with other discharges or components of discharges (whether thermal or non-thermal):

(a) Produce conditions so as to create a nuisance; or

(b) Do not comply with applicable provisions of Subsection 17-3.05(1), F.A.C.

17-3.061 SURFACE WATERS: GENERAL CRITERIA

(1) The criteria of surface water quality hereinafter provided shall be applied to all surface waters except within zones of mixing.

(2) A violation of any of the following surface water quality criteria constitutes pollution. Additional, more stringent or alternative criteria than indicated in this paragraph may, however, be specified for individual classes of water under Sections 17-3.091, 17-3.111, 17-3.121, 17-3.131, and 17-3.141 of this Chapter.

(a) Arsenic — shall not exceed 0.05 milligrams per liter (mg/l).

(b) BOD — shall not be increased to exceed values which would cause dissolved oxygen to be depressed below the limit established for each class and, in no case shall it be great enough to produce nuisance conditions.

(c) Chlorides — in predominantly marine waters, the chloride content shall not be increased more than ten percent (10%) above normal background chloride content. Normal daily and seasonal fluctuations in chloride levels shall be maintained.

(d) Chromium — shall not exceed 0.50 milligrams (mg)/l hexavalent or 1.0 milligrams (mg)/l total chromium in effluent discharge and shall not exceed 0.05 milligrams (mg)/l total chromium after reasonable mixing in the receiving water.

(e) Copper — shall not exceed 0.5 milligrams (mg)/l.

(f) Detergents — shall not exceed 0.5 milligrams (mg)/l.

(g) Fluorides — shall not exceed 10.0 milligrams (mg)/l as fluoride ion.

(h) Lead — shall not exceed 0.05 milligrams (mg)/l.

(i) Nutrients — The discharge of nutrients shall continue to be limited as needed to prevent violations of other standards contained in this Chapter. Man-induced nutrient enrichment (total nitrogen or total phosphorus) shall be considered degradation in relation to the provisions of Section 3.041 of this Chapter and Section 17-4.242.

(j) Oils and Greases:

1. Dissolved or emulsified oils and greases shall not exceed 5.0 milligrams (mg)/l.

2. No undissolved oil, or visible oil defined as iridescence, shall be present to cause taste or odor, or otherwise interfere with the beneficial uses of waters.

(k) pH — pH of receiving waters shall not be caused to vary more than one (1.0) unit above or below natural background pH of the water; the lower value shall not be less than six (6.0) and the upper value shall not be more than eight and one half (8.5).

(l) Phenolic compounds as listed — Chlorinated phenols including trichlorophenols; chlorinated creosols, 2-chlorophenol; 2, 4 - dichlorophenol and pentachlorophenol; 2, 4 - dinitrophenol; phenol — shall not exceed 1.0 micrograms per litre (ug/l) unless higher values are shown not to be chronically toxic. Such higher values shall be approved in writing by the Secretary. Phenolic compounds other than those produced by the natural decay of plant material, named or unnamed, shall not taint the flesh of edible fish or shellfish or produce objectionable taste or odor in a drinking water supply.

(m) Radioactive Substances:

1. Combined radium 226 and 228 — shall not exceed five picocuries per liter.

2. Gross alpha particle activity including radium 226, but excluding radon and uranium — shall not exceed fifteen picocuries per liter.

(n) Specific Conductance — shall not be increased more than 100% above background levels or to a maximum level of 500 micromhos per centimeter in those surface waters in which the specific conductance of the water at the surface is less than 500 micromhos per centimeter; and shall not be increased more than 50% above background level or to a maximum level of 5,000 micromhos per centimeter for predominantly freshwaters as defined in Section 17-3.021 in which the specific conductance of the water at the surface is equal to or greater than 500 micromhos per centimeter.

(o) Substances in concentrations which injure, are chronically toxic to, or produce adverse physiological or behavioral response in humans, animals, or plants — none shall be present.

(p) Substances in concentrations which result in the dominance of nuisance species — none shall be present.

(q) Turbidity — shall not exceed fifty (50) Jackson Units above natural background as related to a standard candle turbidimeter.

(r) Zinc — shall not exceed 1.0 milligrams (mg)/l.

(3) Dissolved Oxygen: Notwithstanding the specific numerical criteria for individual classes of water under Subsections 17-3.091(13), 17-3.111(11), 17-3.121(14), 17-3.131(6), and 17-3.141(2), Florida Adminsitrative Code, the Department recognizes that, in certain bodies of water or segments of water bodies, the dissolved oxygen may be below the applicable criteria at certain times due to man-induced causes which cannot be controlled or abated with technology or management practices including zero discharge, or due to natural background conditions. Under such conditions, the background levels

shall be the criteria; however, daily and seasonal fluctuations shall be maintained. This level may be determined only after public notice and opportunity for public hearing, and consideration of the factors listed in Subsection 17-3.031(2), Florida Administrative Code, and specified in a Department permit; or the level may be determined in accordance with 17-3.031, Florida Administrative Code.

17-3.071 GROUNDWATERS—GENERAL CRITERIA

(1) The groundwater quality standards in this Chapter contain water quality criteria which are applicable to each classification of receiving groundwater outside of a zone of discharge established pursuant to Section 17-4.245.

(2) In addition to any technology-based groundwater effluent limitations required by Department rule, the Department may also specify water quality-based effluent limitations to assure that water quality criteria will be met.

(3) The groundwater quality criteria specified in Sections 17-3.101 or 17-3.151 shall be applied to all groundwaters except within zones of discharge.

(4) A violation of any groundwater criterion contained in Sections 17-3.101 or 17-3.151 constitutes pollution.

(5) These groundwater criteria and other provisions relating to groundwater are an initial but necessary step by the Department in a field in which there exists limited knowledge. In an effort to further refine the state's groundwater quality policy, there is hereby created a Groundwater Quality Task Force which shall meet regularly and report findings and suggestions regarding these groundwater quality standards and associated rule provisions. Said Task Force shall be composed of sixteen persons, with one representative from each of the five water management districts, five representatives from affected industry, five from environmental groups or other groups the Chairman of the Commission shall elect to invite to participate, and one representative from the Department who shall act as Chairman of that Task Force. In developing the proposed revisions, the Task Force shall consider the various geologic and hydrologic provinces of the state; the most beneficial uses of the groundwaters of the state; criteria necessary to protect those uses; and the integration of groundwater quality and quantity management. Said Task Force shall provide written status reports to the Commission quarterly and a final report no later than September 1, 1979. No later than January 31, 1980 the Commission shall consider at a public hearing any proposed revisions.

(6) The Department must attempt to protect the most beneficial uses of the groundwaters of the state to assure continued availability of this invaluable resource. To achieve the necessary protection, specific standards reflecting these beneficial uses are set forth in these Chapters. However, recognizing the complexities and concerns of implementing groundwater standards, the Commission shall review the groundwater standards contained herein, together with the report of the Task Force established pursuant to (5) above at a public hearing no later than January 31, 1980. Unless the Commission affirmatively determines that the groundwater standards remain appropriate, or amends them as it deems necessary, all such groundwater standards shall be repealed effective January 31, 1980. In the event of repeal of groundwater standards pursuant to this subsection, any regulations applicable to groundwaters at the date of the adoption of this section shall apply. Permits issued prior to January 31, 1980 in accordance with such groundwater standards shall remain in full force and effect until such permits expire, are modified, or revoked in accordance with applicable rules and statutes.

17-3.081 CLASSIFICATION OF WATERS, USAGE, RECLASSIFICATION

(1) All waters of the State have been classified according to designated uses as follows:

CLASS I-A — Potable Water Supplies — Surface waters

CLASS I-B — Potable and Agricultural Water Supplies and Storage — Groundwaters

CLASS II — Shellfish Propagation or Harvesting — Surface waters

CLASS III — Recreation, Propagation and Management of Fish and Wildlife — Surface waters

CLASS IV — Agricultural Water Supplies — Surface waters

CLASS V-A — Navigation, Utility and Industrial Use — Surface waters

CLASS V-B — Freshwater Storage, Utility and Industrial Use — Groundwaters

(2) Classification of a water body according to a particular designated use or uses does not preclude utilization of the water for other purposes.

(3) The specific water quality criteria corresponding to each water classification are listed in Sections 17-3.091 to 17-3.151, inclusive.

(4) Water quality classifications are arranged in order of the degree of protection required, with Class I water having generally the most stringent water quality criteria and Class V the least.

(5) Criteria applicable to a classification are designed to maintain the minimum conditions necessary to assure the suitability of water for the designated use of the classification. In addition, applicable criteria are generally adequate to maintain minimum conditions required for the designated uses of less stringently regulated classifications. Therefore, unless clearly inconsistent with the criteria applicable, the designated uses of less stringently regulated classifications shall be deemed to be included within the designated uses of more stringently regulated classifications.

(6) Any person regulated by the Department or having a substantial interest in this Chapter may seek reclassification of waters of the State by filing a petition with the Secretary in the form required by Section 17-1.24, F.A.C.

(7) A petition for reclassification shall reference and be accompanied by the information necessary to support the affirmative finding required in this section to support the proposed reclassification.

(8) All reclassifications of waters of the State shall be adopted, after public notice and public hearing, only upon an affirmative finding by the Environmental Regulation Commission that:

(a) The proposed reclassification will establish the present and future most beneficial use of the waters; and

(b) Such a reclassification is clearly in the public interest.

(9) Reclassification of waters of the State which establishes more stringent criteria than presently established by this Chapter shall be adopted, only upon additional affirmative finding by the Environmental Regulation Commission that the proposed designated use is attainable, upon consideration of environmental, technological, social, economic, and institutional factors.

17-3.091 CRITERIA: CLASS I-A WATERS — POTABLE WATER SUPPLIES — SURFACE WATERS

The criteria listed below are for surface waters designated for use as a potable supply. The standards contained in Sections 17-3.051 and 17-3.061 shall apply to all waters of this class, unless more stringent levels are specified below. The following criteria are to be applied except within zones of mixing:

(1) Alkalinity — shall not be depressed below 20 milligrams per litre ((mg)/l) as $CaCO_3$.

(2) Ammonia (un-ionized) — shall not exceed 0.02 milligrams (mg)/l.

(3) Bacteriological Quality — Coliform group not to exceed 1,000 per 100 milliliters as a monthly average, using either most probable number (MPN) or membrane filter (MF) counts; nor to exceed 1,000 per 100 milliliters in more than 20% of the samples examined during any month; nor exceed 2,400 per 100 milliliters (MPN or MF count) at any time. Based on a minimum of five samples taken over a 30-day period, the fecal coliform bacterial level shall not exceed 200 per 100 milliliters as computed by the log mean, nor shall more than 10% of the total samples taken during any 30-day period exceed 400 per 100 milliliters.

(4) Barium — shall not exceed 1 milligrams (mg)/l.

(5) Beryllium — shall not exceed 0.11 milligrams (mg)/l in waters with a hardness equal to or less than 150 (in milligrams (mg)/l of $CaCO_3$), and shall not exceed 1.10 milligrams (mg)/l in harder waters.

(6) Biological Integrity — the Shannon-Weaver diversity index of benthic macroinvertebrates shall not be reduced to less than 75% of background levels as measured using organisms retained by a U.S. Standard No. 30 sieve and collected and composited from a minimum of three Hester-Dendy type artificial substrate samplers of 0.10 to 0.15 square meters area, each incubated for a period of four weeks.

(7) Cadmium — shall not exceed 0.8 micrograms per litre (μg)/l) in a water with a hardness (in milligrams (mg)/l of $CaCO_3$) equal to or less than 150, and shall not exceed 1.2 micrograms (μg)/l in harder waters.

(8) Chlorides — shall not exceed two hundred fifty (250) milligrams (mg)/l.

(9) Chlorine (total residual) — shall not exceed 0.01 milligrams (mg)/l.

(10) Copper — shall not exceed 30 micrograms (μg)/l.

(11) Cyanide — shall not exceed 5.0 micrograms (μg)/l.

(12) Dissolved Gases — shall not exceed 110% of the saturation value for gases at the existing atmospheric and hydrostatic pressure.

(13) Dissolved Oxygen — shall not be less than 5 milligrams (mg)/l. Normal daily and seasonal fluctations above this level shall be maintained.

(14) Dissolved Solids — not to exceed five hundred (500) milligrams (mg)/l as a monthly average or exceed one thousand (1,000) milligrams (mg)/l at any time.

(15) Fluorides — shall not exceed 1.5 milligrams (mg)/l.

(16) Iron — shall not exceed 0.3 milligrams (mg)/l.

(17) Lead — shall not exceed .03 milligrams (mg)/l.

(18) Mercury — shall not exceed 0.2 micrograms (μg)/l.

(19) Nickel — shall not exceed 0.1 milligrams (mg)/l.

(20) Nitrate — shall not exceed 10 milligrams (mg)/l as N or that concentration determined in (21) below.

(21) Nutrients — In no case shall nutrient concentrations of a body of water be altered so as to cause an imbalance in natural populations of aquatic flora and fauna.

(22) Pesticides and Herbicides.

(a) Aldrin plus Dieldrin — shall not exceed 0.003 micrograms (μg)/l.

(b) Chlordane — shall not exceed 0.01 micrograms (μg)/l.

(c) 2-4-D — shall not exceed 100 micrograms (μg)/l.

(d) 2,4,5-TP — shall not exceed 10 micrograms (μg)/l.

(e) DDT — shall not exceed 0.001 micrograms (μg)/l.

(f) Demeton — shall not exceed 0.1 micrograms (μg)/l.

(g) Endosulfan — shall not exceed 0.003 micrograms (μg)/l.

(h) Endrin — shall not exceed 0.004 micrograms (μg)/l.

(i) Guthion — shall not exceed 0.01 micrograms (μg)/l.

(j) Heptachlor — shall not exceed 0.001 micrograms (μg)/l.

(k) Lindane — shall not exceed 0.01 micrograms (μg)/l.

(l) Malathion — shall not exceed 0.1 micrograms (μg)/l.

(m) Methoxychlor — shall not exceed 0.03 micrograms (μg)/l.

(n) Mirex — shall not exceed 0.001 micrograms (μg)/l.

(o) Parathion — shall not exceed 0.04 micrograms (μg)/l.

(p) Toxaphene — shall not exceed 0.005 micrograms (μg)/l.

(23) Phthalate Esters — shall not exceed 3.0 micrograms (μg)/l.

(24) Polychlorinated Biphenyls — shall not exceed 0.001 micrograms (μg)/l.

(25) Selenium — shall not exceed 0.01 milligrams (mg)/l.

(26) Silver — shall not exceed 0.07 micrograms (μg)/l.

(27) Transparency — the depth of the compensation point for photosynthetic activity shall not be reduced by more than 10% as compared to the natural background value.

(28) Zinc — shall not exceed 0.03 milligrams (mg)/l.

17-3.101 CRITERIA: CLASS I-B WATERS — POTABLE AND AGRICULTURAL WATER SUPPLIES AND STORAGE — GROUNDWATERS

As stated in Section 17-3.161, all groundwaters with total dissolved solids levels of less than 10,000 milligrams per litre ((mg)/l) are classified as Class I-B. The criteria contained in Section 17-3.071 apply to all waters in this classification unless more stringent levels are specified below. The criteria contained in Section 17-3.051(1) and the following criteria are to be applied except within zones of discharge:

(1) Arsenic — shall not exceed 0.05 milligrams (mg)/l.

(2) Barium — shall not exceed 1.0 milligrams (mg)/l.

(3) Cadmium — shall not exceed 0.01 milligrams (mg)/l.

(4) Chromium — shall not exceed 0.05 milligrams (mg)/l.

(5) Endrin — shall not exceed 0.2 micrograms per litre (μg)/l.

(6) Fluorides — shall not exceed 1.5 milligrams (mg)/l unless background information indicates prior existence of higher levels than 1.5 milligrams (mg)/l, in which case those higher levels are not to be exceeded.

(7) Lindane — shall not exceed 0.004 milligrams (mg)/l.

(8) Lead — shall not exceed 0.05 milligrams (mg)/l.

(9) Mercury — shall not exceed 0.002 milligrams (mg)/l.

(10) Methoxychlor — shall not exceed 0.1 milligrams (mg)/l.

(11) Nitrate — shall not exceed 10.0 milligrams (mg)/l as N.

(12) Radioactive Substances:

(a) Combined radium 226 and 288 — shall not exceed five picocuries per liter.

(b) Gross alpha particle activity including radium 226, but excluding radon and uranium — shall not exceed fifteen picocuries per liter.

(13) Selenium — shall not exceed 0.01 milligrams (mg)/l.

(14) Silver — shall not exceed 0.05 milligrams (mg)/l.

(15) Substances shall not be present in concentrations which injure, are chronically toxic to, or produce significant adverse physiological or behavioral responses in humans, animals, or plants.

(16) 2,4-D — shall not exceed 0.1 milligrams (mg)/l.

(17) 2,4,5-TP — shall not exceed 0.01 milligrams (mg)/l.

(18) Toxaphene — shall not exceed 0.005 milligrams (μg)/l.

17-3.111 CRITERIA: CLASS II WATERS — SHELLFISH PROPAGATION OR HARVESTING — SURFACE WATERS

The criteria listed below are for surface waters classified as Class II. The standards contained in Section 17-3.051 and 17-3.061 also shall apply to all waters of this class, unless additional or more stringent levels are specified below. The following criteria are to be applied except within zones of mixing:

(1) Aluminum — shall not exceed 1.5 milligrams ((mg)/l).

(2) Antimony — shall not exceed 0.2 milligrams (mg)/l.

(3) Bacteriological Quality — the median coliform MPN (Most Probable Number) of water shall not exceed seventy (70) per hundred (100) milliliters, and not more than ten percent (10%) of the samples shall exceed a MPN of two hundred and thirty (230) per one hundred (100) milliliters. The fecal coliform bacterial level shall not exceed a median value of 14 MPN per 100 milliliters with not more than ten percent (10%) of the samples exceeding 43 MPN per 100 milliliters.

(4) Biological Integrity — the Shannon-Weaver diversity index of benthic macroinvertebrates shall not be reduced to less than 75% of established background levels as measured using organisms retained by a U.S. Standard No. 30 sieve and collected and composited from a minimum of three natural substrate samples, taken with Ponar type samplers with minimum sampling areas of 225 square centimeters.

(5) Bromine and Bromates — free (molecular) bromine shall not exceed 0.1 milligrams (mg)/l, and bromates shall not exceed 100 milligrams (mg)/l.

(6) Cadmium — shall not exceed 3.0 micrograms (μg)/l.

(7) Chlorine (total residual) — shall not exceed 0.01 milligrams (mg)/l.

(8) Copper — shall not exceed 0.015 milligrams (mg)/l.

(9) Cyanide — shall not exceed 5.0 micrograms (μg)/l.

(10) Dissolved Gases — shall not exceed 110% of the saturation value for gases at the existing atmospheric and hydrostatic pressures.

(11) Dissolved Oxygen — the concentration in all waters shall not average less than 5 milligrams (mg)/l in a 24-hour period and shall never be less than 4 milligrams (mg)/l. Normal daily and seasonal fluctuations above these levels shall be maintained.

(12) Fluorides — shall not exceed 1.5 milligrams (mg)/l.

(13) Iron — shall not exceed 0.3 milligrams (mg)/l.

(14) Manganese — shall not exceed 0.1 milligrams (mg)/l.

(15) Mercury — shall not exceed 0.1 micrograms (μg)/l.

(16) Nickel — shall not exceed 0.1 milligrams (mg)/l.

(17) Nutrients — In no case shall nutrient concentrations of a body of water be altered so as to cause an imbalance in natural populations of aquatic flora and fauna.

(18) Odor — threshold odor number not to exceed 24 at 60 degrees C as a daily average.

(19) Pesticides and Herbicides:

(a) Aldrin plus Dieldrin — shall not exceed 0.003 micrograms (μg)/l.

(b) Chlordane — shall not exceed 0.004 micrograms (μg)/l.

(c) DDT — shall not exceed 0.001 micrograms (μg)/l.

(d) Demeton — shall not exceed 0.1 micrograms (μg)/l.

(e) Endosulfan — shall not exceed 0.001 micrograms (μg)/l.

(f) Endrin — shall not exceed 0.004 micrograms (μg)/l.

(g) Guthion — shall not exceed 0.01 micrograms (μg)/l.

(h) Heptachlor — shall not exceed 0.001 micrograms (μg)/l.

(i) Lindane — shall not exceed 0.004 micrograms (μg)/l.

(j) Malathion shall not exceed 0.1 micrograms (μg)/l.

(k) Methoxychlor — shall not exceed 0.03 micrograms (μg)/l.

(l) Mirex — shall not exceed 0.001 micrograms (μg)/l.

(m) Parathion — shall not exceed 0.04 micrograms (μg)/l.

(n) Toxaphene — shall not exceed 0.005 micrograms (μg)/l.

(20) pH — pH shall not be caused to vary more than one (1.0) unit above or below normal pH of coastal waters as defined in Section 17-3.021 and not more than two-tenths (0.2) unit above or below normal pH of open waters as defined in Section 17-3.021 and lower value shall not be less than six and one-half (6.5) and the upper value not more than eight and one-half (8.5).

(21) Phosphorus (elemental) — shall not exceed 0.1 micrograms (μg)/l.

(22) Polychlorinated Biphenyls — shall not exceed 0.001 micrograms (μg)/l.

(23) Selenium — shall not exceed 0.025 milligrams (mg)/l.

(24) Silver — shall not exceed 0.05 micrograms (μg)/l.

(25) Transparency — the depth of the compensation point for photosynthetic activity shall not be reduced by more than 10% as compared to the natural background value.

17-3.121 CRITERIA: CLASS III WATERS — RECREATION — PROPAGATION AND MANAGEMENT OF FISH AND WILDLIFE — SURFACE WATERS

The criteria listed below are for surface waters classified as Class III. The standards contained in Sections 17-3.051 and 17-3.061 also apply to all waters of this classification, unless additional or more stringent criteria are specified below. The following criteria are to be applied except within zones of mixing.

(1) Alkalinity — shall not be depressed below 20 milligrams per litre ((mg)/l) as $CaCO_3$ in predominantly fresh waters.

(2) Aluminum — shall not exceed 1.5 milligrams (mg)/l in predominantly marine waters.

(3) Ammonia (un-ionized) — shall not exceed 0.02 milligrams (mg)/l in predominantly fresh waters.

(4) Antimony — shall not exceed 0.2 milligrams (mg)/l in predominantly marine waters.

(5) Bacteriological Quality — fecal coliform bacteria shall not exceed a monthly average of 200 per 100 ml of sample, nor exceed 400 per 100 ml of sample in 10 percent of the samples, nor exceed 800 per 100 ml on any one day, nor exceed a total coliform bacteria count of 1,000 per 100 ml as a monthly average, nor exceed 1,000 per 100 ml in more than 20 percent of the samples examined during any month, nor exceed 2,400 per 100 ml at any time. Monthly averages shall be expressed as geometric means based on a minimum of 10 samples taken over a 30-day period. Either MPN or MF counts may be utilized.

(6) Beryllium — in predominantly fresh waters shall not exceed 0.011 milligrams (mg)/l in waters with a hardness equal to or less than 150 (in milligrams (mg)/l of $CaCO_3$) and shall not exceed 1.10 milligrams (mg)/l in harder waters.

(7) Biological Integrity — the Shannon-Weaver diversity index of benthic macroinvertebrates shall not be reduced to less than 75 percent of established background levels as measured using organisms retained by a U.S. Standard No. 30 sieve and, in predominantly fresh waters, collected and composited from a minimum of three Hester-Dendy type artificial substrate samplers of 0.10 to 0.15 m^2 area each incubated for a period of four weeks, and in predominantly marine waters, collected and composited from a minimum of three natural substrate samples, taken with Ponar type samplers with minimum sampling area of 225 square centimeters.

(8) Bromine and Bromates — free (molecular) bromine shall not exceed 0.1 milligrams (mg)/l in predominantly marine waters, and bromates shall not exceed 100 milligrams (mg)/l in predominantly marine waters.

(9) Cadmium — shall not exceed 5.0 micrograms per litre (μg)/l in predominantly marine waters, shall not exceed 0.8 micrograms (μg)/l in predominantly fresh waters in water with a hardness (in milligrams (mg)/l of $CaCO_3$) of less than 150, and shall not exceed 1.2 micrograms (μg)/l in harder waters.

(10) Chlorine (total residual) — shall not exceed 0.01 milligrams (mg)/l.

(11) Copper — shall not exceed .015 milligrams (mg)/l in predominantly marine waters, shall not exceed .03 milligrams (mg)/l in predominantly fresh waters.

(12) Cyanide — shall not exceed 5.0 micrograms (μg)/l.

(13) Dissolved Gases — shall not exceed 110% of the saturation value for gases at the existing atmospheric and hydrostatic pressures.

(14) Dissolved Oxygen — in predominantly fresh waters, the concentration shall not be less than 5 milligrams (mg)/l. In predominantly marine waters, the concentration shall not average less than 5 milligrams (mg)/l in a 24-hour period and never less than 4

milligrams (mg)/l. Normal daily and seasonal fluctuations above these levels shall be maintained in both predominantly fresh waters and predominantly marine waters.

(15) Fluorides — shall not exceed 5.0 milligrams (mg)/l in predominantly marine waters.

(16) Iron — shall not exceed 1.0 milligrams (mg)/l in predominantly fresh waters; 0.3 milligrams (mg)/l in predominantly marine waters.

(17) Lead — shall not exceed .03 milligrams (mg)/l in predominantly fresh waters.

(18) Mercury — shall not exceed 0.1 micrograms (μg)/l in predominantly marine waters; shall not exceed 0.2 micrograms (μg)/l in predominantly fresh waters.

(19) Nickel — shall not exceed 0.1 milligrams (mg)/l.

(20) Nutrients — In no case shall nutrient concentrations of a body of water be altered so as to cause an imbalance in natural populations of aquatic flora or fauna.

(21) Pesticides and Herbicides:

(a) Aldrin plus Dieldrin — shall not exceed 0.003 micrograms (μg)/l.

(b) Chlordane — shall not exceed 0.01 micrograms (μg)/l in predominantly fresh waters and 0.004 micrograms (μg)/l in predominantly marine waters.

(c) DDT — shall not exceed 0.001 micrograms (μg)/l.

(d) Demeton — shall not exceed 0.1 micrograms (μg)/l.

(e) Endosulfan — shall not exceed 0.003 micrograms (μg)/l in predominantly fresh waters and 0.001 micrograms (μg)/l in predominantly marine waters.

(f) Endrin — shall not exceed 0.004 micrograms (μg/l.

(g) Guthion — shall not exceed 0.01 micrograms (μg)/l

(h) Heptachlor — shall not exceed 0.001 micrograms (μg)/l.

(i) Lindane — shall not exceed 0.01 micrograms (μg)/l in predominantly fresh waters and 0.004 micrograms (μg)/l in predominantly marine waters.

(j) Malathion -- shall not exceed 0.1 micrograms (μg)/l.

(k) Methoxychlor — shall not exceed 0.03 micrograms (μg)/l.

(l) Mirex — shall not exceed 0.001 micrograms (μg)/l.

(m) Parathion — shall not exceed 0.04 micrograms (μg)/l.

(n) Toxaphene — shall not exceed 0.005 micrograms (μg)/l.

(22) pH — pH of receiving waters shall not be caused to vary more than one (1.0) unit above or below normal pH of predominantly fresh waters and coastal waters as defined in Section 17-3.021; and not more than two tenths (0.2) units above or below normal pH of open waters as defined in Section 17-3.021; the lower value shall not be less six (6.0) in predominantly fresh waters or less than six and one-half (6.5) in predominantly marine waters; and the upper value not more than eight and one-half (8.5).

(23) Phosphorus (elemental) — shall not exceed 0.1 micrograms (μg/l in predominantly marine waters.

(24) Phthalate Esters shall not exceed 3.0 micrograms (μg/l in predominantly fresh waters.

(25) Polychlorinated Biphenyls — shall not exceed 0.001 micrograms (μg)/l.

(26) Selenium — shall not exceed 0.025 milligrams (mg)/l.

(27) Silver — shall not exceed 0.07 micrograms (μg)/l in predominantly fresh waters and 0.05 micrograms (μg)/l in predominantly marine waters.

(28) Transparency — the depth of the compensation point for photosynthetic activity shall not be reduced by more than 10 percent compared to the natural background value.

(29) Zinc — shall not exceed .03 milligrams (mg)/l in predominantly fresh waters.

17-3.131 CRITERIA: CLASS IV WATERS — AGRICULTURAL SUPPLIES — SURFACE WATERS

The criteria listed below are for surface waters classified as Class IV. The standards established in Sections 17-3.051 and 17-3.061 also apply to all waters of this classification, unless additional or more stringent criteria are specified below. The following criteria are to be applied except within zones of mixing.

(1) Alkalinity — shall not exceed 600 milligrams (mg)/l as $CaCO_3$.

(2) Beryllium — shall not exceed 0.1 milligrams (mg)/l in waters with a hardness in milligrams (mg)/l of $CaCO_3$ of less than 150 and shall not exceed 0.5 milligrams (mg)/l in harder waters.

(3) Boron — shall not exceed 0.75 milligrams (mg)/l.

(4) Color, odor, and taste producing substances and other deleterious substances, including other chemical compounds, attributable to domestic wastes, industrial wastes, and other wastes — only such amounts as will not render the waters unsuitable for agricultural irrigation, livestock watering, industrial cooling, industrial process water supply purposes or fish survival.

(5) Cyanide — shall not exceed 5.0 micrograms (μg)/l.

(6) Dissolved Oxygen — shall not average less than 4.0 milligrams (mg)/l in a 24-hour period and shall never be depressed below 3.0 milligrams (mg)/l.

(7) Iron — shall not exceed 1.0 milligrams (mg)/l.

(8) Mercury — shall not exceed 0.2 micrograms (μg/l.

(9) Nickel — shall not exceed 0.1 milligrams (mg)/l.

(10) pH — not more than (1.0) unit from the normal or not less than six (6.0) nor greater than 8.5.

17-3.141 CRITERIA: CLASS V-A WATERS — NAVIGATION, UTILITY AND INDUSTRIAL USE — SURFACE WATERS.

The criteria listed below are for surface waters classified as Class V-A. The standards contained in Sections 17-3.051 and 17-3.061 also apply to all waters of this classification unless additional, alternative or more stringent criteria are specified below. The following criteria are to be applied except within zones of mixing:

(1) Cyanide — shall not exceed 5.0 micrograms per litre (μg)/l).

(2) Dissolved Oxygen — not to be depressed below 2.0 milligrams per litre ((mg)/1).

(3) Mercury — shall not exceed 0.2 micrograms (μg)/l.

(4) Odor producing substances — only in such amounts as will not unreasonably interfere with the use of the water for the designated purpose of this classification.

(5) pH — not lower than 5.0 nor greater than 9.5 except certain swamp waters which may be as low as 4.5.

17-3.151 CRITERIA: CLASS V—B WATERS — FRESHWATER STORAGE AND UTILITY AND INDUSTRIAL SUPPLY — GROUNDWATERS

As state in Section 17-3.161, all groundwaters with total dissolved solids equal to or greater than 10,000 milligrans per litre (mg)/l) are classified as Class V-B. Except within zones of discharge.

(1) The standards contained in 17-3.051(1) and 17-3.071 apply to all waters of this classification, and

(2) The standards contained in 17-3.101 apply to waters of this classification that are used for or can reasonably be expected to be used for a potable supply.

17-3.161 CLASSIFIED WATERS

(1) The surface waters of the State of Florida are classified by river basins or sub-basins as Class III — Recreation — Propagation and Management of Fish and Wildlife, with only the individual exceptions to Class III listed within each basin as delineated on USGS Map, "Drainage Basins in Florida", Map Series No. 28, October 1967. Outstanding Florida Waters are listed in Section 17-3.041. All secondary and tertiary canals wholly within agricultural areas are hereby classified as Class IV, and are not listed below. Agricultural areas shall generally include lands actively used solely for the production of food and fiber which are zoned for agricultural use where county zoning is in effect. Agricultural areas exclude lands which are platted and subdivided or in a transition phase to residential use.

(2) The groundwaters of the State of Florida are classified on the basis of total dissolved solids content. Groundwaters with levels of total dissolved solids less than 10,000 mg/l are classified as Class I-B, and groundwaters with naturally-occurring levels of total dissolved solids equal to or greater than 10,000 mg/l are classified as Class V-B. These waters are not listed below.

(3) Florida Water Classifications

(a) Nassau — St. Mary's Basin (No. 19)

This basin consists of U.S. Geological Survey Basins 09J — St. Mary's River Basin and coastal area and 09D — Coastal area between St. Mary's River and St. John's River and lists wholly or partially in the following counties: Nassau, Baker, Columbia, Union and Duval (consolidated city of Jacksonville). The following individual waters are exceptions to Class III:

1. Nassau County. South Amelia River — Nassau River north Harrison Creek — Class II. Alligator Creek — Class II.

2. Nassau County and Duval County. Nassau River and Creek — Nassau Sound to Seymore Point — Class II.

3. Duval County (Consolidated City of Jacksonville). Pumpkinhill Creek — Class II. Intracoastal Waterway and tributaries — confluence of Nassau and Amelia Rivers south to Flashing Marker "72", thence eastward along Ft. George River to Ft. George Inlet and includes Garden Creek and both prongs of Simpson Creek — Class II.

(b) St. John's Basin (No. 20). This basin consists of U.S. Geological Survey Basin 09E — St. John's River basin and Sub-basins 09E1 — St. John's River above Oklawaha River, 09E2 — Oklawaha River, and 09E3 — St. John's River below Oklawaha River, and lies wholly or partially in the following counties: Duval (Consolidated City of Jacksonville), St. John's, Clay, Bradford, Alachua, Putnam, Flagler, Volusia, Marion, Levy, Lake, Sumter, Seminole, Orange, Brevard, Osceola, Polk, Indian River, Okeechobee and St. Lucie. The following individual waters are exceptions to Class III:

1. Brevard County and Indian River County. St. John's River and Tributaries — Lake Washington Dam south through and including Sawgrass Lake, Lake Hellen Blazes, and Blue Cypress Lake to SR 60 in Indian River County — Class I-A.

2. Duval County. Ft. George River — Ft. George Inlet north to Nassau — St. Mary's/St. John's Basin Boundary. Class II.

(c) Suwannee Basin (No. 21). This basin consists of U.S. Geological Survey Basin 09J — Suwannee River Basin and Sub-basins, 09J1 — Suwannee River above Withlacoochee River, 09J2 — Alapaha River, 09J3 — Withlacoochee River, 09J5 — Suwannee River below Withlacoochee River, and 09J6 — Santa Fe River and lies wholly or partially in the following counties: Madison, Hamilton, Columbia, Baker, Union, Bradford, Clay, Alachua, Gilchrist, Suwannee, Lafayette, Dixie, Taylor and Levy. The following individual waters are exceptions to Class III:

1. Dixie County. Tidal Creeks within USGS Sub-basin 09J5 north of, but excluding the mouth of, the Suwannee River from Suwannee River or Gulf of Mexico to source — Class II.

2. Levy County. Tidal Creeks within USGS Sub-basin 09J5 south of, but excluding the mouth of, the Suwannee River from Suwannee River or Gulf of Mexico to source — Class II.

3. Hamilton County. Jumping Gully Creek — Unclassified.

(d) Aucilla — Ochlockonee — St. Mark's Basin (No. 22). This basin consists of U.S. Geological Survey Basins 09K — Aucilla River Basin, 11B — Coastal area between Aucilla River and Ochlockonee River, 11C — Ochlockonee River basin and coastal areas, and 11D — Coastal area between Ochlockonee River and Apalachicola River and lies wholly or partially in the following counties: Gadsden, Leon, Jefferson, Madison, Liberty, Franklin, Wakulla, Taylor, Lafayette, and Dixie. The following individual waters are exceptions to Class III.

1. Gadsden County. Quincy Creek — SR 65 to source — Class I-A Holman Branch — SR 270-A to source — Class I-A.

2. Franklin County. Ochlockonee Bay — Confluence of Sopchoppy and Ochlockonee Rivers to Gulf of Mexico — Class II. Alligator Harbor — East from a line from Peninsula Point north to St. James Island to mean high water — Class II. Gulf of Mexico — North of a line from

Peninsula Point on Alligator Point to the northeastern tip of Dog Island and bounded on the east by Alligator Harbor and on the west by St. George Sound — Class II. St. George Sound (Portion in USGS Basin 11D) — Gulf of Mexico westerly to Apalachicola Bay — Class II. East Bay and Tributaries (Portion in USGS Basin 11D) — Apalachicola Bay to source — Class II.

3. Wakulla County. Oyster Bay, Apalachee Bay, and Tributaries — west of a line from western tip of Shell Point south to FL. 4 sec. marker and southerly to Ochlockonee Point, with the exception of Spring Creek and portion of King Bay west and north of a line from western-most tip of Porter Island south to Hungry Point — Class II.

4. Jefferson County and Wakulla County. Coastal waters — Mouth of Aucilla River west to Live Oak Point excluding mouths of drainage areas — Class II.

5. Taylor County. Fenholloway River — Class V-A.

6. Dixie County. Tidal Creeks and coastal waters — Horseshoe Point south to basin boundary of USGS Basin 09K — Class II.

(e) Withlacoochee Basin (No. 23). This basin consists of U.S. Geological Survey basins 09H — Coastal area between the Withlacoochee River Basin and Suwannee River and lies wholly or partially in the following counties: Gilchrist, Levy, Alachua, Marion, Citrus, Sumter, Hernando, Pasco, Lake and Polk. The following individual waters are exceptions to Class III:

1. Levy County. Tidal Creeks and coastal waters — South from USGS Basin boundary line 09H separating the Suwanee Basin from the Withlacoochee Basin to the Withlacoochee River excluding the Cedar Key area and the mouth of the Withlacoochee River — Class II.

(f) Tampa Bay Area Basin (No. 24). This basin consists of U.S. Geological Survey Basins 10J — Coastal area between Withlacoochee River and Hillsborough River, 10H — Hillsborough River Basin and coastal area north of Alafia River, 10G — Alafia River Basin and 10F — Coastal area between Alafia River and Myakka River and lies wholly or partially in the following counties: Citrus, Hernando, Pasco, Pinellas, Hillsborough, Polk, Manatee, Sarasota, Charlotte, and Lee. The following individual waters are exceptions to Class III:

1. Citrus County. Tidal Creeks and coastal waters — Latitude 28 degrees 54 minutes N., south to Hernando County Line with the exception of waters which are bounded by and including the Crystal River on the north, St. Martin's River on the south, barrier islands on the west, and the mainland on the east — Class II.

2. Pinellas County. Mullet Key Area — Class II. Tampa Bay — South Pinellas County Line to Gandy Causeway — Class II. Old Tampa Bay — Gandy Causeway to Safety Harbor — Class II. Safety Harbor — To Old Tampa Bay — Class II. Mobbly Bay — Portion in Pinellas County — Class II.

3. Hillsborough County. Old Tampa Bay and Mobbly Bay — Beginning at the intersection of the north shore of SR 60 (Courtney Campbell Parkway) and Longitude 83 degrees 35 minutes 45 seconds west, thence due north to the line of mean high water, thence westward along the line of mean high water, including Rocky and Double Branch Creeks to SR 580 and up the upper Tampa Bay watershed canal to a line connecting the lines of mean high water on the outer sides of the canal banks, to the county line, thence southerly along the county line to SR 60, thence along the north shore of SR 60 to the point of beginning — Class II. Old Tampa Bay — All waters within Hillsborough County bounded on the north by SR 60 (Courtney Campbell Parkway), the south by Interstate 4 (Howard Franklin Bridge), the west by the county line, and the east by the line of mean high water — Class II. Tampa Bay — Beginning at Gadsden Point, thence along a line connecting Gadsden Point and the intersection of Gadsden Point Cut and Cut "A" to a point one-half nautical mile inside said intersection, thence westward along a line one-half nautical mile inside and parallel to Gadsden Point Cut, Cut "G," Cut "J," Cut "J2," and Cut "K," to the line of mean high water, thence along the line of mean high water to the point of beginning — Class II. Tampa Bay — Beginning at the intersection of the Hillsborough County Line and the line of mean high water, thence to the rear range marker of Cut "D," thence northerly along the line of Cut "D" range to a point one-half nautical mile inside the southern boundary of Cut "C", thence along a line one-half mile inside and parallel to Cut "C", Cut "D", and Cut "E" to a point with Latidude 27 degrees 45 minutes 40 seconds N. and Longitude 82 degrees 30 minutes 40 seconds west, thence to a point Latitude 27 degrees 45 minutes north and Longitude 82 degrees 27 minutes west, thence on a true bearing of 140 degrees to the line of mean high water, thence along the line of mean high water to the western tip of Mangrove Point, thence to the northwestern tip of Tropical Island, thence eastward along the line of mean high water to the eastern tip of Goat Island, thence due south to the line of mean high water, thence along the line of mean high water to the point of beginning — Class II. Tampa Bay — Hillsborough County portion west of the Sunshine Skyway and from the three fathom depth contour up to the line of mean high water — Class II. Hillsborough River — City of Tampa Water Treatment Plant Dam to Flint Creek — Class I-A. Cow House Creek — Hillsborough River to source — Class I-A.

4. Manatee County — Terra Cela Bay — To Terra Cela Point — Class II. Palma Sola Bay — Class II. Passage Key Area — Egmont Key to Anna Maria Island — Class II. Sarasota Bay — East-west line through marker "48" on Intracoastal Waterway south to Manatee County Line — Class II. Manatee River — Rye Bridge Road to the sources thereof, including but not limited to the the following tributaries: the East Fork of the Manatee River, the North Fork of the Manatee River, Boggy Creek, Gilley Creek, Poley Branch, Corbit Branch, Little Deep Branch, Fisher Branch, Ft. Crawford Creek, Webb Branch, Clearwater Branch, Craig Branch, and Guthrey Branch — Class I-A. Ward Lake — SR 70 to source (SR 675) — Class I-A.

5. Sarasota County. Sarasota Bay — West of Center (Intracoastal Waterway) — Class II. Lemon Bay — Forked Creek south to Charlotte County Line — Class II.

6. Charlotte County. Lemon Bay and Tributaries — N. Charlotte County Line south to Placida Harbor and bounded on the east by SR 775. Class II. Placida Harbor

— to mean high water — Class II. Gasparilla Sound — Placida Harbor to Charlotte County Line — Class II. Bull Bay — mean high water to Charlotte County Line — Class II. Turtle Bay — mean high water to Charlotte County Line — Class II. Charlotte Harbor — Portion in USGS Basin 10F south to Charlotte County Line — Class II.

7. Lee County. Charlotte Harbor — Portion in USGS Basin 10F south from N. Lee County Line — Class II.

(g) Peace Basin (No. 25). This basin consists of U.S. Geological Survey Basins 10E (Myakka River Basin) 10D (Peace River Basin) and 10C (Coastal area between Peace River and Caloosahatchee River) and lies wholly or partially in the following counties: Polk, Hillsborough, Manatee, Hardee, Highlands, Sarasota, DeSoto, Charlotte, Glades, and Lee. The following individual waters are exceptions to Class III:

1. Sarasota County. Big Slough Canal — South to U.S. 41 — Class I-A. Myakka River — Myakka vicinity through Upper and Lower Myakka Lakes to Manhattan Farms — Class I-A. Myakka River — S.W. North Port Charlotte Limit south to Charlotte County Line — Class II.

2. DeSoto County. Horse Creek — Vicinity Jct. SR 760 and 761 to Peace River — Class I-A.

3. DeSoto County and Charlotte County. Prairie Creek — Headwaters to Shell Creek — Class I-A.

4. Charlotte County. Myakka River — N. Charlotte County Line south to Charlotte Harbor — Class II. Charlotte Harbor — Portion in Peace Basin south to Charlotte County Line — Class II. Alligator Creek — North and south prongs from headwaters to SR 765-A — Class I-A. Shell Creek Headwaters to Ridge Harbor — Class I-A. Lemon Bay and tributaries — Placida Harbor north to Tampa Bay Area/Peace Basin Boundary, and bounded on the east by SR 775 — Class II. Port Charlotte Canal System — Surface waters lying upstream of, or directly connected to, Fordham Waterway upstream of Conway Boulevard — Class I-A.

5. Lee County. Charlotte Harbor — Portion in USGS Basin 10C north to N. Lee County Line — Class II. Pine Island Sound Charlotte Harbor to San Carlos Bay — Class II. Matlacha Pass — Charlotte Harbor to San Carlos Bay — Class II. San Carlos Bay — Portion in USGS Basin 10C — Class II.

(h) Kissimmee Basin (No. 26). This Basin consists of U.S. Geological Survey Sub-basin 10B1 — Lake Okeechobee inflow area and lies wholly or partially in the following counties: Lake, Orange, Polk, Osceola, Highlands, Okeechobee, Glades Charlotte, Saint Lucie, and Martin. There are no individual exceptions to Class III in this basin.

(i) Florida East Coastal Basin (No. 27). This basin consists of U.S. Geological Survey Basins 09F (Coastal area between St. John's River and Turkey Creek) and 10A (Turkey Creek and coastal area south to St. Lucie River) and lies wholly or partially in the following counties: Duval (Consolidated City of Jacksonville), St. John's, Flagler, Volusia, Brevard, Indian River, St. Lucie, and Martin. The following individual waters are exeptions to Class III:

1. St. John's County. Tolomato River (North River) and Tributries — From a line connecting Spanish Landing to Booth Landing south to Intracoastal waterway marker number 55 — Class II. Guano River and tributaries. — Guano Lake Dam south to Tolomato River — Class II. Salt Run — All waters south of an east-west line connecting Lighthouse Park boat ramp with Conch Island — Class II. Matanza River, Treasure Beach Canal System— From Intracoastal Waterway marker number 29 south to Flagler County Line — Class II.

2. St. John's County and Flagler County. Pellicer Creek — Class II.

(3) Flagler County, Matanza River (Intracoastal Waterway) — N. Flagler County Line south to Fl. Marker "109" — Class II.

4. Volusia County. Indian River North — Channel Marker 57 south to Mosquito Lagoon — Class II. Mosquito Lagoon — Indian River North south to S. Volusia County Line — Class II.

5. Brevard County. Mosquito Lagoon — North Brevard County Line south to Max Hoeck Creek — Class II. Indian River — N. Brevard County Line south to Florida East Coast Railroad Crossing (vicinity Jay Jay) — Class II. Indian River — Barnes Blvd. south to South Section Line of Section 29, T. 26 S., R. 37E., Palm Shores — Class II. Indian River — Cape Malabar south to S. Brevard County Line — Class II. Trout Creek — Class II. Kid Creek — Class II. Goat Creek — Class II.

6. Indian River County. Indian River — Sebastian Inlet (N. Indian River County Line) south to Wabasso vicinity east of channel centerline — Class II. Indian River — Wabasso vicinity south to vicinity North Relief Canal — Class II.

7. St. Lucie County. Indian River — N. St. Lucie County Line south to Garfield Point — Class II. Indian River — Middle Cove vicinity south to S. St. Lucie County Line, east of Channel centerline — Class II.

8. Martin County. Indian River — N. Martin County Line south to St. Lucie Inlet, east of Channel centerline — Class II.

(j) Lower Florida Basin (No. 28). This basin consists of U.S. Geological Survey Sub-basin 10B2 — Lake Okeechobee and the Everglades and lies wholly or partially in the following counties: Charlotte, Glades, Lee, Hendry, Collier, Monroe, Dade, Broward, Palm Beach, Martin, St. Lucie, and Okeechobee. The following individual waters are exceptions to Class III:

1. Lee County. Caloosahatchee River — E. Lee County Line to South Florida Water Management District Structure 79 — Class I-A. San Carlos Bay — Portion in USGS Sub-basin 10B2 — Class II. Matanzas Pass — San Carlos Bay to Estero Bay — Class II. Hell Peckish Bay — Class II.

2. Collier County. Cocohatchee River — Class II. Little Hickory Bay — Class II. Wiggins Pass — Class II. Inner and Outer Clam Bay — Class II. Inner and Outer Doctors Bay — Class II. Connecting Waterways — Wiggins Pass south to Outer Doctors Bay — Class II. Naples Bay — Class II. Dollar Bay — Class II. Tidal Bays and Passes — Rookery Bay south and easterly through Ten Thousand Islands to Monroe County Line — Class II.

3. Monroe County. Monroe County Coastline — North Monroe County Line south and including Florida Bay portion within Everglades National Park — Class II.

4. Dade County. Miami River — Salinity barrier easterly 5.7 miles to Biscayne Bay — Class IV.

5. Broward County. Abandoned Rock Pit — Northeast corner of No. 7 and Prospect Field Road in the S.W. Quarter of Section 7, T. 49 S., R. 42 E. — Class I-A.

6. Palm Beach County. M- Canal L-8 to Lake Mangonia — Class I-A. Lake Mangonia — Class I-A. Clear Lake — Class I-A. Canal C-18 (freshwater portion) — Class I-A. Canal C-18 — Salinity barrier to Loxahatchee River — Class II.

7. Palm Beach County and Martin County. Loxahatchee River — Above Florida East Coast Railroad Bridge including South, Northwest, and North Forks — Class II.

8. Martin County. Great Pocket — St. Lucie River to Peck's Lake — Class II.

9. Multi County. Lake Okeechobee — Class I-A.

(k) Apalachicola Basin (No. 31). This basin consists of U.S. Geological Survey Basins 11E — Apalachicola River Basin and Sub-basins 11E2 — Chattahoochee River below Mulberry Creek, 11E7 — Apalachicola River and 11E8 — Chipola River, and lies wholly or partially in the following counties: Jackson, Gadsden, Washington, Bay, Calhoun, Liberty, Gulf, and Franklin. The following individual waters are exceptions to Class III.

1. Gadsden County. Mosquito Creek — U.S. Highway 90 north to Florida State Line — Class I-A.

2. Franklin County. East Bay — Portion in USGS Sub-basin 11E7 with exception of area encompassed within 2-mile radius from Apalachicola entrance of John Gorrie Memorial Bridge — Class II. Apalachicola Bay — Portion in USGS Sub-basin 11E7 with exception of area encompassed within 2-mile radius of John Gorrie Memorial Bridge — Class II.

(l) Choctawhatchee Basin (No. 32). This basin consists of U.S. Geological Survey Basins 11F — Coastal Area between Apalachicola River and Choctawhatchee River, 12A — Choctawhatchee River Basin, 12B — Coastal area between Choctawhatchee River and Yellow River and Sub-basins 12A3 — Pea River and 12A4 — Choctawhatchee River below Pea River, and lies wholly or partially in the following counties: Jackson, Calhoun, Gulf, Franklin, Holmes, Washington, Bay, Walton, Okaloosa, Santa Rosa, and Escambia. The following individual waters are exceptions to Class III.

1. Jackson County, Washington County, and Bay County. Econfina Creek — Deer Point Impoundment to source — Class I-A.

2. Gulf County. Indian Lagoon — West of Indian Pass and St. Vincent Sound — Class II. St. Joseph Bay — South and west of a line from St. Joseph Point to vicinity Port St. Joe — Class II.

3. Franklin County. St. George Sound (Portion of USGS Basin 11F) — East Pass to Apalachicola Bay — Class II. Apalachicola Bay — Portion in USGS Basin 11F with exception of area encompassed within 2-mile radius from Apalachicola entrance of John Gorrie Memorial Bridge — Class II. St. Vincent Sound — Apalachicola Bay to Indian Pass — Class II.

4. Bay County. East Bay and Tributaries — East of U.S. Highway 98 to, but excluding, Wetappo Creek — Class II. North Bay and Tributaries — North of U.S. Highway 98 to Deer Point Dam excluding Alligator and Fanning Bayous — Class II. West Bay and Tributaries — West of North Bay (line from West Bay Point on the north to Shell Point on the south) except West Bay Creek (northwest of Channel Marker 27C off Goose Point), Crooked Creek (north of a line from Crooked Creek Point to Doyle Point), and Burnt Mill Creek (north of a line from Graze Point to Cedar Point) — Class II. Deer Point Impoundment — Dam to source — Class I-A. Bayou George and Creek — Impoundment to source — Class I-A. Bear Creek — Impoundment to source — Class I-A. Big Cedar Creek — Impoundment to source — Class I-A.

5. Walton County and Okaloosa County. Choctawhatchee Bay and Tributaries — Eastward from a line from White Point southwesterly through F1. Light Marker "2" of the Intracoastal Waterway, and south of a line from Alaqua Point to Wheeler Point, to the eastern sources — Class II.

6. Okaloosa County. Rocky Bayou — Choctawhatchee Bay to Rocky Creek — Class II. Santa Rosa Sound — Okaloosa/Santa Rosa County Line east to Manatee Point — Class II.

7. Okaloosa County, Santa Rosa County, and Escambia County. Santa Rosa Sound — From a line connecting Gulf Breeze approach to Pensacola Beach, Bascule Bridge, and Sharp Point east to north-south line through Manatee Point with exception of the Navarre Beach area from Channel Marker "109" to Navarre Bridge — Class II.

8. Santa Rosa County. Blackwater Bay (Portion in USGS Basin 12B) — From a line connecting Robinson's Point to Broad River south to East Bay (line due west from Escribano Point) — Class II. East Bay and Tributaries (Portion in USGS Basin 12B) — Blackwater Bay (line due west from Escribano Point) southerly to Pensacola Bay (line from Garcon Point on the North to Redfish Point on the South) — Class II.

(m) Perdido-Escambia Basin (No. 33). This basin consists of U.S. Geological Survey Basin 12C — Yellow River Basin, 12D — Blackwater River Basin and coastal area, 12E — Escambia River Basin and coastal area, and Sub-basins 12E1 — Conecuh River and 12E4 — Escambia River and lies wholly or partially in the following counties: Walton, Okaloosa, Santa Rosa, and Escambia. The following individual waters are exceptions to Class III.

1. Santa Rosa County. Blackwater Bay (Portion in USGS Basins 12C and 12D) — From a line connecting Robinson's Point to Broad River south to East Bay (line due west from Escribano Point) — Class II. East Bay (Portion in USGS Basin 12D) — Blackwater Bay (line due west from Escribano Point) southerly to Pensacola Bay (line from Garcon Point on the north to Redfish Point on the South) — Class II.

2. Santa Rosa County and Escambia County. Escambia Bay — Louisville and Nashville Railroad Trestle south to Pensacola Bay (Line from Emanuel Point east northeasterly to Garcon Point) — Class II. Pensacola Bay East of a line connecting Emanuel Point on the north to the south end of the Pensacola Bay Bridge (U.S. Highway 98) — Class II. Santa Rosa Sound — From a line connecting Gulf Breeze approach to Pensacola Beach, Bascule Bridge, and Sharp Point east to Santa Rosa/Okaloosa County line with exception of the Navarre Beach area from Channel Marker "109" to Navarre Beach — Class II.

GEORGIA WATER QUALITY CONTROL REGULATIONS AND STANDARDS

(Rules and Regulations of the State of Georgia; Volume V, Chapter 391-3-6 — Water Quality Control; Effective June 30, 1974; Amended February 22, 1978; September 13, 1979; July 14, 1980; Water-Use Classifications as amended through July 1980; Approved by U.S. Environmental Protection Agency September 25, 1980)

391-3-6-.01 Organization and Administration.

(1) **Purpose.** The purpose of Paragraph 391-3-6-.01 is to establish the organizational and administrative procedures to be followed in the administration and enforcement of the Georgia Water Quality Control Act, as amended, and to carry out the purposes and requirements of said Act and of the Federal Water Pollution Control Act Amendments of 1972, as amended.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Georgia Water Quality Control Act, as amended, unless otherwise defined in this Paragraph or in any other Paragraph of these rules.

(a) "Act" means the Georgia Water Quality Control Act, as amended.

(b) "Board" means the Board of Natural Resources of the State of Georgia.

(c) "Department" means the Department of Natural Resources of the State of Georgia.

(d) "Director" means the Director of the Division of Environmental Protection of the Department of Natural Resources, State of Georgia.

(e) "Division" means the Division of Environmental Protection of the Department of Natural Resources, State of Georgia.

(f) "E.P.A." means the United States Environmental Protection Agency.

(g) "Federal Act" means the Federal Water Pollution Control Act Amendments of 1972, as amended.

(h) "National Pollutant Discharge Elimination System" (NPDES) means the national system for the issuance of permits under Section 402 of the Federal Water Pollution Control Act Amendments of 1972.

(i) "Regional Administrator" means the Regional Administrator for the EPA region which includes the State of Georgia.

(3) **Organization.** The Division of Environmental Protection of the Department of Natural Resources is responsible for enforcing those environmental protection laws of the State of Georgia as specified in the Executive Reorganization Act of 1972, as amended. Requests for information and submission of materials should be made to the Division office.

(4) **Administrative Hearings.**

(a) Hearings may be held in accordance with the Act in connection with the following matters:

1. To determine whether or not an alleged pollution is contrary to the public interest.

2. In connection with the securing, within the time specified by order or permit of the Director, of such operating results as are reasonable and practicable of attainment toward the control, abatement or prevention of pollution of the waters of the State and the preservation of the necessary quality for the reasonable use thereof.

3. In connection with notice to the holder of a permit of intent to revoke, suspend, or modify the permit.

4. In connection with the refusal of any person to cooperate with the efforts of the Division to reduce pollution, and upon the issuance of an order by the Director, to bring about the reduction or elimination of pollution within a reasonable time.

5. Any person who is aggrieved or adversely affected by any order or action of the Director and who petitions the Director for a hearing within thirty (30) days of the issuance of such order or notice of such action. Such person shall be granted a hearing before a hearing officer appointed by the Board of Natural Resources. The initial hearing and any administrative review thereof shall be conducted in accordance with Section 17(a) of the Executive Reorganization Act of 1972, as amended.

6. Any person against whom an emergency order is directed, provided such person petitions the Director for a hearing within the thirty (30) days of the issuance of such order. Such person shall be afforded a hearing as soon as possible.

7. In connection with public hearings required pursuant to Section 402 (b)(3) of the Federal Act and Federal Regulations, 40 C.F.R. 124.36.

8. In connection with public hearings or public participation required pursuant to Section 101(e) of the Federal Act.

(b) Insofar as applicable to the administrative procedures required pursuant to the Georgia Water Quality Control Act, as amended, Sections 14, 15, 16, 17, and 18 of the Georgia Administrative Procedure Act, as amended, and Section 17(a) of the Executive Reorganization Act of 1972, as amended, shall apply.

(5) **Notice.** Notice of all hearings provided for above shall be issued in accordance with Section 14 of the Georgia Administrative Procedure Act, as amended, and Federal Regulations, 40 C.F.R. 124.37.

(6) **Notice of File Plan of Correction or Improvement.**

(a) In order to carry out a comprehensive plan to prevent and control pollution, the Division, as required by Section 5 of the Act and Section 303 of the Federal Act, may conduct studies and perform evaluations to determine waste load allocations in order to specify the degree of treatment and or technology necessary to achieve the established effluent limitations, the maintenance of existing wastewater treatment technology, supplementary treatment or other specific measures necessary to attain and maintain applicable water quality standards, and protect the down stream users; or such other measures necessary to prevent further pollution or reduce existing pollution. Upon the establishment of the necessary corrective action, the discharger

will be required to file a plan and schedule of improvement with the Division. The Director may issue a notice to any person to submit within a specified time a plan of improvement and schedule for compliance with the specified requirements.

(b) The Director is authorized to approve plans, specifications, and related material, and to issue permits on behalf of the Division to persons who apply for such permits in accordance with Section 10 of the Act and such rules as are adopted and promulgated pursuant to same.

(7) **Effective Date.** This Paragraph shall become effective on June 30, 1974.

391-3-6-.02 Preparation and Submission of Engineering Reports and Plans and Specifications.

(1) **Purpose.** The purpose of Paragraph 391-3-6-.02 is to establish procedures to be followed by persons submitting to the Division engineering reports, plans and specifications, and related materials for the construction of any system for the disposal or treatment of pollutants.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act, unless otherwise defined in this Paragraph or in any other Paragraph of these Rules:

(a) "Professional Engineer." A person registered to practice professional engineering in accordance with the provisions of an Act Governing the Practice of Professional Engineering in Georgia (Ga. L. 1945, p. 294, as amended; Ga. Code Section 84-2100).

(b) "Owner." Any person owning or operating any system for the disposal or treatment of pollutants.

(c) "Sewerage System" means any system for the treatment or disposal of pollutants including treatment works, pipe lines or conduits, pumping stations and force mains, and all other constructions, devices, and appliances appurtenant thereto, used for conducting pollutants to the point of ultimate disposal.

(3) **General Provisions.**

(a) Any person who desires to erect, modify, or alter a sewerage system shall obtain approval of any plans, specifications and related materials for such system from the Division prior to commencement of construction.

(b) Engineering material submitted to the Division shall be prepared by a Professional Engineer competent in the treatment of water pollutants.

(c) During the early stages of planning for the construction of a sewerage system, and prior to the formal submission of an application and accompanying materials for any permit required pursuant to the Act, or materials submitted for Division approval pursuant to these rules, a conference between the project owner or his representative and representatives of the Division shall be held at the request of either the Director or the project owner, in order to reach a clear understanding of the proposal to be formally submitted to the Division at a later time. Such conference shall be granted within sixty (60) days after a written request to the Division by the project owner or his representative. If a conference is not granted within such period, then such permit application or other materials shall be filed and acted upon by the Division after the expiration of such period.

(d) Sufficient copies of completed reports, plans and specifications, and related materials shall be submitted to the Division to cover necessary distribution when approved. Such material, accompanied by a letter of transmittal, shall be submitted by the project owner or his representative well in advance of any critical date involved, in order that time will be available for review, discussion and revision when necessary. The submittal of such material shall be complete, accurate, distinct, legible, and relevant in respect to the project to which it applies. Permit applications shall be processed as provided in Paragraph 391-3-6-.06.

(e) Plans for a sewerage system submitted to the Division will be considered for approval by the Division only when designed so as to minimize the passage of rainwater from roofs, streets or other areas and all groundwater, other than unavoidable infiltration, through such sewerage system.

(f) All proposed lift stations must be approved by the Division.

(4) **Engineering Reports.** Engineering reports submitted to the Division shall contain a comprehensive description of the proposed project and shall include the following:

(a) Pertinent information regarding the existing sewerage sytem, if applicable;

(b) Characteristics of existing pollutants and existing or proposed treatment of such pollutants;

(c) Demonstration of the need for the proposed sewerage system;

(d) Evaluation of alternatives to define the most cost effective method for meeting established effluent limitations, water quality goals, and treatment requirements;

(e) Results to be expected from treatment process;

(f) Sufficient maps, charts, tables, calculations, basis of design data and graphs to make the report readily understandable;

(g) An operation and maintenance program description;

(h) Such other pertinent engineering information as the Division may require.

(5) **Plans and Specifications.** Plans and specifications submitted to the Division for a sewerage system shall include the following:

(a) A map showing the area to be served by the sewerage system;

(b) Profiles of proposed sewers;

(c) Construction details of manholes and other special sewer structures;

(d) General and detail plans for the treatment facility;

(e) Complete design data for the treatment facility plans, to be submitted in duplicate on forms specified by the Division;

(f) Specifications for the construction of the sewerage system;

(g) Such other plans and specifications as the Division may require.

(6) **General Map Plans.** General map plans submitted to the Division for a sewerage system shall include the following:

(a) A map plan that shows the entire area to be served, drawn to a scale of from 100 to 300 feet per inch. The map plan may be divided into sections, provided the sheets are bound together and indexed to show the area covered by each sheet.

(b) All existing and proposed streets in the area to be served; surface elevations at all street intersections; the location of all existing sewers, separate or combined; the location of the treatment facility; the location of the existing and proposed sewer outlets or overflows; the elevation of the highest known stream water level at the outlets and the treatment facility; and clear identification of any areas from which sewage is to be pumped.

(c) Clear designation on the plan by suitable symbols of all sewer appurtenances, including, but not limited to, manholes, siphons and pumps.

(d) Such other information as the Division may require.

(7) **Sewer Plans and Profiles.** Sewer plans and profiles submitted to the Division for a sewerage system shall include the following:

(a) Sewers and force mains, drawn at a scale that shows the profile for all manholes, siphons, railroad crossings, street or stream crossings, elevations of stream beds, normal stream water levels, and sizes and grades of sewers which show surface elevations and sewer invert elevations.

(b) Detailed drawings of all sewer appurtenances, including, but not limited to, manholes, inspection chambers, siphons, lift stations, and any special structures to accompany the sewer plans. Detailed drawings shall be to a scale suitable to clearly show the design details.

(8) **Treatment Facilities Plans.** Plans for treatment facilities submitted to the Division shall include the following:

(a) A general plan that clearly identifies the exact location of the facilities, areas reserved for future expansion, access roads to the various units, and the point at which the access roads connect with existing road or street systems. It shall also show sufficient detail of the units, pipelines or any other features so as to make the proposed treatment process clearly and easily understood. The elevations of all units and water surfaces shall be shown.

(b) Detail plans which show longitudinal and transverse sections sufficient to explain the construction of each treatment unit.

(c) Flow measuring devices at appropriate points in the plan. Sampling and recording devices may be required by the Division when deemed necessary.

(d) Such other information as the Division may require.

(9) **Approval of Plans and Specifications.** Approval of the plans and specifications by the Division does not include or imply approval of the structural, electrical, or mechanical integrity of the sewerage system, treatment facilities, units or equipment.

(10) **Deviation from Approved Plans and Specifications.** No deviations from approved plans and specifications shall be made during construction unless documentation showing proposed changes has been submitted to and approved by the Division.

(11) **Effective Date.** This Paragraph shall become effective on June 30, 1974.

391-3-6-.03 Water Use Classifications and Water Quality Standards.*

(1) **Purpose.** The establishment of water quality standards.

(2) **Water Quality Enhancement:**

(a) The purposes and intent of the State in establishing Water Quality Standards are to provide enhancement of water quality and prevention of pollution; to protect the public health or welfare in accordance with the public interest for drinking water supplies, conservation of fish, game and other beneficial aquatic life, and agricultural, industrial, recreational, and other beneficial uses.

(b) Those waters in the State whose existing quality is better than the minimum levels established in standards on the date standards become effective will be maintained at high quality; with the State having the power to authorize new developments, when it has been affirmatively demonstrated to the State that a change is justifiable to provide necessary social or economic development; and provided further that the level of treatment required is the highest and best practicable under existing technology to protect existing beneficial water uses.

(c) In applying these policies and requirements, the State of Georgia will recognize and protect the interest of the Federal Government in interstate (including coastal and estuarine) waters. Toward this end the State will consult and cooperate with the Environmental Protection Agency on all matters affecting the Federal interest.

(3) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with definitions as set forth in the Act and as otherwise herein defined:

(a) "Reasonable and necessary uses" means drinking water supplies, conservation of fish, game and other aquatic life, agricultural, industrial, recreational, and other legitimate uses.

(b) "Shellfish" refers to clams, oysters, scallops, mussels, and other mollusks.

(c) "Intake temperature" is the natural or background temperature of a particular waterbody unaffected by any man-made discharge or thermal input.

(d) "Coastal waters" are those littoral recreational waters on the ocean side of the Georgia coast.

(4) **Water Use Classifications.** Water use classifications for which the criteria of this Paragraph are applicable are as follows:

(a) Drinking Water Supplies
(b) Recreation
(c) Fishing, Propagation of Fish, Shellfish, Game and Other Aquatic Life
(d) Agricultural
(e) Industrial
(f) Navigation
(g) Wild River
(h) Scenic River
(i) Urban Stream

(5) **General Criteria for All Waters.** The following criteria are deemed to be necessary and applicable to all waters of the State:

(a) All waters shall be free from materials associated with municipal or domestic sewage, industrial waste or any other waste which will settle to form sludge deposits that become putrescent, unsightly or otherwise objectionable.

(b) All waters shall be free from oil, scum and floating debris associated with municipal or domestic sewage, industrial waste or other discharges in amounts sufficient to be unsightly or to interfere with legitimate water uses.

(c) All waters shall be free from material related to municipal, industrial or other discharges which produce turbidity, color, odor or other objectionable conditions which interfere with legitimate water uses.

(d) All waters shall be free from toxic, corrosive, acidic and caustic substances discharged from municipalities, industries or other sources in amounts, concentrations or combinations which are harmful to humans, animals or aquatic life.

(e) Applicable State and Federal requirements and regulations for the discharge of radioactive substances shall be met at all times.

(f) No man-made physical or other alteration of stream beds that may violate established water quality standards, or reduce the waste assimilative capacity of the streams, will be permitted without the expressed approval of the Environmental Protection Division.

(6) **Specific Criteria for Classified Water Usage.** The following criteria are deemed necessary and shall be required for the specific water usage as shown:

(a) Drinking Water Supplies:

1. Those waters approved by the Environmental Protection Division and requiring only approved disinfection and meeting the requirements of the Federal Drinking Water Standards; or waters approved by the Environmental Protection Division for human consumption and food-processing or for any other use requiring water of a lower quality:

(i) Bacteria: Fecal coliform not to exceed a geometric mean of 50 per 100 ml based on at least four samples taken over a 30-day period and not to exceed 200 per 100 ml in more than five percent of the samples in any 90-day period.

(ii) Floating solids, settleable solids, sludge deposits or any taste, odor or color producing substances: None associated with any waste discharge.

(iii) Sewage, industrial or other wastes: None.

2. Those raw water supplies requiring approved treatment to meet the requirements of the Environmental Protection Division and the Federal Drinking Water Standards or which are approved by the Environmental Protection Division for human consumption and food-processing; or for any other use requiring water of a lower quality:

(i) Bacteria: Fecal coliform not to exceed a geometric mean of 1,000 per 100 ml based on at least four samples taken over a 30-day period and not to exceed a maximum of 4,000 per 100 ml.

(ii) Dissolved Oxygen: A daily average of 6.0 mg/l and no less than 5.0 mg/l at all times for waters designated as trout streams by the State Game and Fish Division. A daily average of 5.0 mg/l and no less than 4.0 mg/l at all times for water supporting warm water species of fish.

(iii) pH: Within the range of 6.0-8.5.

(iv) No material or substance in such concentration that, after treatment, would exceed the requirements of the Environmental Protection Division and the latest edition of Federal Drinking Water Standards.

(v) Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 degrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish

*Applicable to Intrastate and Interstate Waters of Georgia.

Division, there shall be no elevation or depression of natural stream temperature.

(b) Recreation:

1. General recreational activities such as water skiing, boating, and swimming, or for any other use requiring water of a lower quality. These criteria are not to be interpreted as condoning water contact sports in proximity to sewage or industrial waste discharges regardless of treatment requirements:

(i) Bacteria: Fecal coliform not to exceed a geometric mean of:

(I) Coastal Waters — 100 per 100 ml

(II) All other recreational waters — 200 per 100 ml

(III) Should water quality and sanitary studies show natural fecal coliform levels exceed 200/100 ml (geometric mean) occasionally in high quality recreational waters, then the allowable geometric mean fecal coliform level shall not exceed 300 per 100 ml in lakes and reservoirs and 500 per 100 ml in free flowing fresh water streams.

1. The geometric mean will be used as the method of criteria expression. This technique will be applied to no less than four samples collected from a given sampling site over a 30-day period at intervals not less than 24 hours.

(ii) Dissolved Oxygen: A daily average of 6.0 mg/l and no less than 5.0 mg/l at all times for waters designated as trout streams by the State Game and Fish Division. A daily average of 5.0 mg/l and no less than 4.0 mg/l at all times for waters supporting warm water species of fish.

(iii) pH: Within the range of 6.0-8.5.

(iv) Toxic Wastes, Other Deleterious Materials: None in concentrations that would harm man, fish and game or other beneficial aquatic life.

(v) Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 degrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish Division, there shall be no elevation or depression of natural stream temperatures.

(c) Fishing, Propagation of Fish, Shellfish, Game and Other Aquatic Life; or for any other use requiring water of a lower quality:

1. Dissolved Oxygen: A daily average of 6.0 mg/l and no less than 5.0 mg/l at all times for waters designated as trout streams by the State Game and Fish Division. A daily average of 5.0 mg/l and no less than 4.0 mg/l at all times for waters supporting warm water species of fish.

2. pH: Within the range of 6.0-8.5.

3. Bacteria: Fecal coliform not to exceed a geometric mean of 1,000 per 100 ml based on at least four samples taken over a 30-day period and not to exceed a maximum of 4,000 per 100 ml.

4. Bacteria: (Applicable only to waters designated as approved shellfish harvesting waters by the appropriate State agencies). The requirements will be consistent with those established by the State and Federal agencies responsible for the National Shellfish Sanitation Program.

5. Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 degrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish Division, there shall be no elevation or depression of natural stream temperatures.

6. Toxic Wastes, Other Deleterious Materials: None in concentrations that would harm man, fish and game or other beneficial aquatic life.

(d) Agricultural:

1. For general agricultural uses such as stock watering and irrigating; or for any other use requiring water of a lower quality:

(i) Bacteria: Fecal coliform not to exceed a geometric mean of 5,000 per 100 ml based on at least four samples taken over a 30-day period.

(ii) Dissolved Oxygen: No less than 3.0 mg/l at any time.

(iii) pH: Within the range of 6.0-8.5.

(iv) Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 dgrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish Division, there shall be no elevation or depression of natural stream temperatures.

(v) Toxic Substances, Other Deleterious Materials: None in concentrations that would interfere with or adversely affect uses for general agricultural purposes or would prevent fish survival.

(e) Industrial:

1. For processing and cooling water with or without special treatment; or for any other use requiring water of a lower quality:

(i) Dissolved Oxygen: No less than 3.0 mg/l at any time.

(ii) pH: Within the range of 6.0-8.5.

(iii) Toxic Substances, Other Deleterious Materials: None in concentrations that would prevent fish survival or interfere with legitimate and beneficial industrial uses.

(iv) Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 degrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish Division, there shall be no elevation or depression of natural stream temperatures.

(f) Navigation:

1. To provide for commercial ship traffic and protection of seamen or crews:

(i) Bacteria: Fecal coliform not to exceed a geometric mean of 5,000 per 100 ml based on at least four samples taken over a 30-day period.

(ii) Dissolved Oxygen: No less than 3.0 mg/l at any time.

(iii) pH: Within the range of 6.0 - 8.5.

(iv) Toxic Substances, Other Deleterious Materials: None in concentrations that would damage vessels, prevent fish survival or otherwise interfere with commercial navigation.

(v) Temperature: Not to exceed 90 degrees F. At no time is the temperature of the receiving waters to be increased more than 5 degrees F above intake temperature except that in estuarine waters the increase will not be more than 1.5 degrees F. In streams designated as trout or smallmouth bass waters by the State Game and Fish Division, there shall be no elevation or depression of natural stream temperatures.

(g) Wild River:

1. This classification will be applicable to any waters of the State when so designated by an authorized State or Federal Agency and will be effective simultaneously with that Agency's proper designation.

2. For all waters designated as "Wild River," there shall be no alteration of natural water quality from any source.

(h) Scenic River:

1. This classification will be applicable to any waters of the State when so designated by an authorized State or Federal Agency and will be effective simultaneously with that Agency's proper designation.

2. For all waters designated as "Scenic River," there shall be no alteration of natural water quality from any source.

(i) Urban Stream:

1. This classification is applicable to streams in highly developed urban areas.

(i) All conditions specified under **"General Criteria for All Waters"** [391-3-6-.03(5)] will apply, and in addition, the waters so classified are to be aesthetically compatible to adjacent areas.

(ii) Bacteria: Fecal coliform not to exceed a geometric mean of 2,000 per 100 ml based on at least four samples taken over a 30-day period and not to exceed a maximum of 5,000 per 100 ml.

(iii) pH: Within the range of 6.0 - 8.5.

(iv) Dissolved Oxygen: No less than 3.0 mg/l at any time.

(7) Natural Water Quality: It is recognized that certain natural waters of the State may have a quality that will not be within

20-955 O—84——86

the general or specific requirements contained herein.

(8) **Treatment Requirements.** Notwithstanding the above criteria, the requirements of the State relating to secondary or equivalent treatment of all waste shall prevail. The adoption of these criteria shall in no way preempt the treatment requirements.

(9) **Streamflows.** Specific criteria or standards set for the various parameters apply to all flows on regulated streams. On unregulated streams, they shall apply to all streamflows equal to or exceeding to 7-day, 10-year minimum flow.

(10) **Mixing Zone.** Effluents released to streams or impounded waters shall be fully and homogeneously dispersed and mixed insofar as practical with the main flow or water body by appropriate methods at the discharge point. Use of a reasonable and limited mixing zone may be permitted on receipt of satisfactory evidence that such a zone is necessary and that it will not create an objectionable or damaging pollution condition.

(11) **Effective Date.** This Paragraph shall become effective on June 30, 1974.

391-3-6.04 Marine Sanitation Devices.

(1) **Purpose.** The purpose of Paragraph 391-3-6.04 is to prescribe procedures pertaining to construction, installation and operation of marine sanitation devices, facilities or methods of sewage disposal.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise herein defined in this Paragraph or in any other Paragraph of these Rules.

(a) "Boat" means any vessel or watercraft whether moved by oars, paddles, sails, or other power mechanism, inboard or outboard, or any other vessel or structure floating upon the waters of this State whether or not capable of self locomotion, including, but not limited to, cabin cruisers, houseboats, barges and similar floating objects.

(b) "Marine Toilet" means any toilet on or within any boat.

(c) "Other Disposal Unit" means any device on or within any boat, other than marine toilet, which is intended for use in the disposal of human body wastes or sewage.

(d) "Blender" means any mechanical device capable of reducing sewage solids into a finely divided state such that a liquid disinfecting agent may be effectively dispersed throughout the blended sewage.

(e) "Marine Sanitation Devices" means any equipment for installation on a boat which is designed to receive, retain, treat, or discharge sewage or any process to treat such sewage.

(f) "Sewage," for the purposes of this Paragraph only, means water carried wastes, which are generated by human beings or their activities.

(3) **General Provisions.**

(a) Any marine toilet or other disposal unit located on or within any boat operated on waters of this State shall have securely affixed to the interior discharge toilet or unit a suitable marine sanitation device designed, constructed, and operated in accordance with requirements prescribed herein. All sewage passing into or through the marine toilet or other disposal unit shall discharge solely to the marine sanitation device.

(b) This Paragraph shall not apply to ocean going vessels of 20 tons displacement or more.

(4) **Waste Treatment Devices and Equipment.**

(a) All discharges from marine sanitation devices into or upon the waters of this State shall be in compliance with the Federal standards of performance and regulations for marine sanitation devices promulgated pursuant to Section 312 of the Federal Act.

(b) Until such time as said Federal standards and regulations are formally promulgated, the following interim requirements will apply:

1. Marine toilets shall be provided with a blender; a device for the addition of a disinfecting agent in such a manner that the disinfection will be thoroughly mixed with and dispersed throughout the blended sewage; and a detention chamber such that the blended sewage and the disinfecting agent will be in contact for not less than ten minutes but not so long as to cause the septic decomposition of the blended sewage. The treatment equipment shall be firmly fastened to the discharge outlet of the marine toilet. The disinfecting agent shall be a five-percent hypochlorite solution or some other solution approved by the Division.

2. An exception to the requirement that treatment equipment be fastened to the discharge outlet of a marine toilet shall be granted when such discharge outlet is connected to a holding tank located on the boat, provided that:

(i) such holding tank is constructed so as to prevent the removal of the sewage held herein except by pumping;

(ii) the holding tank is properly vented to the outside air in such fashion as not to foul up the interior of the boat structure;

(iii) chemicals which are added to the holding tank are only those approved by the Division; and

(iv) the contents of holding tanks are disposed of only through onshore facilities approved by the Division.

(c) All onshore discharges from marine sanitation devices or other disposal units shall be accomplished only at or through onshore facilities approved by the Division.

(d) Other wastes, including, but not limited to, garbage, rubbish and litter, shall be deposited onshore in approved receptacles for ultimate disposal in a manner prescribed by the Rules and Regulations of the Solid Wastre Management Section of the Division.

(5) **Right of Entry.** Personnel of the Division or other duly authorized agents of the Department shall have access to any boat at reasonable times for the purpose of determining whether or not there is compliance with the provisions of the Act and the rules of the Division.

(6) **Effective Date.** This Paragraph shall become effective June 30, 1974.

391-3-6-05 Emergency Actions.

(1) **Purpose.** The purpose of Paragraph 391-3-6.05 is to provide procedures to handle any emergency which endangers the waters of the State.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in this Paragraph or in any other Paragraph of these Rules.

(3) **Notice Concerning Endangering Waters of the State.** Whenever, because of an accident or otherwise, any toxic or taste-and-color producing substance, or any other substance which would endanger downstream users of the waters of the State or would damage property, is discharged into such waters, or is so placed that it might flow, be washed, or fall into them, it shall be the duty of the person in charge of such substances at the time to forthwith notify the Division in person or by telephone of the location and nature of the danger, and it shall be such person's further duty to immediately take all reasonable and necessary steps to prevent injury to property and downstream users of said water.

(4) **Emergency Orders.** The Director shall have the authority to issue an emergency order pursuant to Section 20 of the Act, and Section 17(a) of the Executive Reorganization Act of 1972, as amended.

(5) **Effective Date.** This Paragraph shall become effective on June 30, 1974.

391-3-6-.06 Waste Treatment and Permit Requirements.

(1) **Purpose.** The purpose of this Paragraph 391-3-6-.06 is to provide for the degree of waste treatment required and the uniform procedures and practices to be followed relating to the application for or the issuance or revocation of permits for the discharge of any pollutant into the waters of the State.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in this

Paragraph or in any other Paragraph of these Rules:

(a) "Effluent Limitation" means any restriction or prohibition established under the Act on quantities, rates, or concentrations, or a combination thereof, of chemical, physical, biological, or other constituents which are discharged from point sources into the waters of the State, including, but not limited to, schedules of compliance.

(b) "NPDES Permit Application" means any application filed by any person with the Director for an NPDES Permit.

(c) "NPDES Permit" means any permit issued by the Division to regulate the discharge of pollutants from any point source into the waters of the State.

(d) "Construction" means any placement, assembly, or installation of facilities or equipment (including contractual obligations to purchase such facilities or equipment) at the premises where such equipment will be used, including preparation work at such premises.

(e) "Concentrated animal feeding operation" means any point source which meets the criteria set forth in the Federal Regulations, 40 C.F.R. 122.54;

(f) "Concentrated aquatic animal production facility" means any point source which meets the criteria set forth in the Federal Regulations, 40 C.F.R. 122.55;

(g) "Aquaculture project" means any point source which meets the criteria set forth in the Federal Regulations, 40 C.F.R. 122.56;

(h) "Separate storm sewer" means any point source which meets the criteria set forth in the Federal Regulations, 40 C.F.R. 122.57;

(i) "Silvicultural point source" means any point source which meets the criteria set forth in the Federal Regulations, 40 C.F.R. 122.58;

(j) "New discharger" means any point source that meets the criteria set forth in the Federal Regulations 40 C.F.R. 122.3;

(k) "New Source" means any point source that meets the criteria set forth in the Federal Regulations 40 C.F.R. 122.3;

(l) "Major discharger" as defined in EPA annual operating guidance for the EPA Regional Offices and the States and specifically listed in the annual State program plan;

(m) "Indirect discharger" means a non-domestic discharger introducing pollutants to a publicly owned treatment works;

(n) "The term 'segment' means a portion of a water quality planning area, the surface waters of which have common hydrologic characteristics (or flow regulation patterns), common natural physical, chemical and biological characteristics and processes, and common reactions to external stresses, such as the discharge of pollutants. Segments will be classified as either a water quality segment or an effluent limitation segment as follows:

1. Water quality segment. Any segment where it is known that water quality does not meet applicable water quality standards and/or is not expected to meet applicable water quality standards even after the application of the effluent limitations required by sections 301(b)(1)(B) and 301(b)(2)(A) of the Act;

2. Effluent limitation segment. Any segment where it is known that water quality is meeting and will continue to meet applicable water quality standards or where there is adequate demonstration that water quality will meet applicable water quality standards after the application of the effluent limitations required by sections 301(b)(1)(B) and 301(b)(2)(A) of the Act."

(3) **Permit Requirement.**

(a) Any person discharging or proposing to discharge any pollutant from a point source into the waters of the State, under any of the circumstances described in Section 10(3) of the Act, shall obtain a permit from the Division to make such discharge.

(b) Any person discharging or proposing to discharge any pollutant from a non-point source into the waters of the State, under the circumstances described in Section 10(4) of the Act, shall obtain a permit from the Division to make such discharge.

(c) Any person owning or operating treatment works, from which a discharge into the waters of the State could possibly occur, excluding discharges which could result from Acts of God, shall apply to the Division for a permit.

(4) **Degree of Waste Treatment Required.**

(a) All pollutants shall receive such treatment or corrective action so as to insure compliance with the terms and conditions of the issued permit and with the following, whenever applicable:

1. Effluent limitations established by EPA pursuant to Sections 301 and 302 of the Federal Act.

2. Standards of performance for new sources established by the EPA pursuant to Section 306 of the Federal Act.

3. Effluent limitations and prohibitions and pretreatment standards established by the EPA pursuant to Section 307 of the Federal Act.

4. Criteria for the issuance of permits to aquaculture projects, as defined in this Paragraph, established by EPA pursuant to Section 318 of the Federal Act;

5. Criteria and standards for Best Management Practices established by EPA pursuant to Section 304(e) of the Federal Act;

6. Criteria and standards for imposing conditions for the disposal of sewage sludge established by EPA pursuant to Section 405 of the Federal Act;

7. Ensure consistency with the requirements of a Water Quality Management plan approved by EPA pursuant to Section 208(b) of the Act;

8. Criteria for ocean discharge established by EPA pursuant to Section 403(c) of the Act;

9. Incorporate alternative effluent limitations or standards where warranted by "fundamentally different factors";

10. Nothwithstanding the above, more stringent effluent limitations may be required as deemed necessary by the Division to meet (a) any other existing Federal laws or regulations, and (b) to insure compliance with any applicable State water quality standards, effluent limitations, treatment standards, or schedules of compliance.

11. With regard to any non-point source, such effluent limitations as are required to insure compliance with applicable State water quality standards.

(b) Calculations and specification of effluent limits and standards shall be made in accordance with the provisions of Federal Regulations, 40 C. F. R. 122.63 and 122.65.

(c) The foregoing requirements shall be applied in considering all applications made pursuant to Section 10 of the Act and no such application will be approved unless the waste treatment facilities contemplated thereby will achieve such limitations and standards upon completion thereof or within such reasonable time thereafter as the Division may provide.

(d) Until such time as such standards, limitations, and prohibitions are formally promulgated pursuant to Sections 301, 302, 306, and 307 of the Federal Act, the Division shall apply such standards, limitations, and prohibitions necessary to achieve the purposes of said sections of the Federal Act. With respect to individual point sources, such limitations, standards, or prohibitions shall be based upon an assessment of technology and processes, to wit:

1) To existing point sources, other than publicly owned treatment works, effluent limitations based on application of the best practicable control technology currently available;

2. To publicly owned treatment works, effluent limitations based upon the application of secondary treatment;

3. To any point source, other than publicly owned treatment works, whose construction commences after the effective date of this Paragraph, effluent limitations which reflect the greatest degree of effluent reduction which the Division determines to

be achievable through application of the best available demonstrated control technology, processes, operating methods, or other alternatives, including, where practicable, a standard permitting no discharge of pollutants.

4. To any point source, as appropriate, effluent limitations or prohibitions designed to prohibit the discharge of toxic pollutants in toxic amounts or to require pretreatment of pollutants which interfere with, pass through, or otherwise are incompatible with the operation of publicly owned treatment works; and

5. To any point source, as appropriate, more stringent effluent limitations as are required to insure compliance with applicable State water quality standards.

(e) To all new dischargers or new sources the following shall apply:

1. Except as provided in subparagraph (e)2. any new discharger on which construction commenced after October 18, 1972, or any new source, which meets the applicable promulgated new source performance standards before the commencement of discharge, shall not be subject to any more stringent new source performance standards, or to any more stringent technology-based standards under section 301(b)(2) of the Federal Act for the shortest of the following periods:

(i) Ten years from the date that construction is completed;

(ii) Ten years from the date the source begins to discharge process or other non-construction related wastewater; or

(iii) The period of depreciation or amortization of the facility for the purposes of Section 167 or 189 (or both) of the Internal Revenue Code of 1954.

Comment: The provisions of this subparagraph do not apply to existing sources which modify their pollution control facilities or construct new pollution control facilities and achieve performance standards, but which are neither new sources nor new dischargers or otherwise do not meet the requirements of this subparagraph.

2. The protection from more stringent standards of performance afforded by subparagraph (e)1. of this section does not apply to:

(i) Additional or more stringent permit conditions which are not technology based, e.g., conditions based on water quality standards, or effluent standards or prohibitions under Section 307(a) of the Federal Act; and

(ii) Additional permit conditions controlling pollutants listed as toxic under Section 307(a) of the Federal Act or as hazardous substances under Section 311 of the Federal Act and which are not controlled by new source performance standards. This includes permit conditions controlling pollutants other than those identified as toxic or hazardous where control of those other pollutants has been specifically identified as the method to control the toxic or hazardous pollutant.

3. Where an NPDES permit issued to a source enjoying a "protection period" under subparagraph (e)1. will expire on or before the expiration of the protection period, such permit shall require the owner or operator of the source to be in compliance with the requirements of Section 301 of the Federal Act and any other then applicable requirements of the Federal Act immediately upon the expiration of the protection period. No additional period for achieving compliance with these requirements shall be allowed.

4. The owner or operator of a new source, a new discharger, a source recommencing discharge after terminating operations, or a source which has been an indirect discharger which commences discharging into navigable waters shall install and have in operating condition, and shall "startup" all pollution control equipment required to meet the terms and conditions of its permits before beginning to discharge. Within the shortest feasible time (not to exceed 90 days), the owner or operator must meet all permit terms and conditions.

5. After the effective date of new source performance standards, in accordance with Section 306(e) of the Federal Act, it shall be unlawful for any owner or operator of any new source to operate such source in violation of those standards, applicable to such source.

(5) **Application for Permit.**

(a) Applications for permits under Section 10 of the Act shall be on forms as may be prescribed and furnished from time to time by the Division. Applications shall be accompanied by all pertinent information as the Division may require in order to establish effluent limitations in accordance with subparagraph 391-3-6-.06(4), including, but not limited to, complete engineering reports, schedule of progress, plans, specifications, maps, measurements, quantitative and qualitative determinations, records, and all related materials.

(b) Engineering reports, plans, specifications, and other material submitted to the Division shall be prepared by a Professional Engineer competent in the field of sewage and industrial waste treatment.

(c) Material submitted shall be complete and accurate.

(d) Any State or NPDES Permit Application form or any other NPDES form submitted to the Division shall be signed as follows:

1. For a corporation, by a principal executive officer of at least the level of vice president;

2. For a partnership or sole proprietorship, by a general partner or the proprietor, respectively; or

3. For a municipality, State, Federal, or other public facility, by either a principal executive officer or ranking elected official.

(e) All other reports or requests for information required by the permit issuing authority shall be signed by a person designated in (d) above or a duly authorized representative of such person, if:

1. The representative so authorized is responsible for the overall operation of the facility from which the discharge originates, e.g., a plant manager, superintendent or person of equivalent responsibility;

2. The authorization is made in writing by the person designated under (d) above; and

3. The written authorization is submitted to the Director.

(f) Any changes in the written authorization submitted to the permitting authority under (e) above which occur after the issuance of a permit shall be reported to the permitting authority by submitting a copy of a new written authorization which meets the requirements of (e) 1. and 2. above.

(g) Any person signing any document under (d) or (e) above shall make the following certification: "I certify under penalty of law that I have personally examined and am familiar with the information submitted in the attached document, and based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

Comment: The permit application will be revised to incorporate this statement. Where a permit program document does not contain the statement, the certification must accompany the appropriate document.

(6) **Receipt and Use of Application and Data.**

(a) Applications for permits will be reviewed together with such other information as may be necessary to ascertain the effect of the discharge or any such pollutant upon the waters into which such pollutant will be discharged.

(b) Copies of the complete NPDES Permit Application received by the Division shall be transmitted to the Regional Administrator for any comment in such manner as the Director and the Regional Administrator shall agree.

(c) The Division shall receive any relevant data collected by the Regional Ad-

Published by THE BUREAU OF NATIONAL AFFAIRS, INC. WASHINGTON, D.C. 20037

ministrator prior to the Division's participation in the NPDES in such manner as the Director and the Regional Administrator shall agree.

(7) **Notice and Public Participation.**

(a) Tentative Determination and Draft Permits:

1. When the Division is satisfied that the application is complete, a tentative determination will be made to issue or deny the permit. If the tentative determination is to issue the permit, a draft permit will be prepared in accordance with Federal Regulations, 40 C.F.R. Section 124.31, and applicable State laws prior to the issuance of a public notice.

(b) Public Notice:

1. Public notice of every complete permit application will be prepared and circulated in a manner designed to inform interested and potentially interested persons of the proposed discharge and of the proposed determination to issue or deny a permit for the proposed discharge. Procedures for circulation of the public notice shall include the following:

(i) Within the geographical area of the proposed discharge the public notice shall be circulated by at least one of the following: posting in the post office or other public buildings near the premises of the applicant in which the discharge is located; posting at the entrance to the applicant's premises or nearby; or publication in one (1) or more newspapers of general circulation in the area of the applicant.

(ii) Posting of the public notice in the office of the Secretary of State.

(iii) A copy of the public notice shall be mailed to the permit applicant and a copy shall be available at the Division office in Atlanta.

(iv) Mailing of the public notice to any person or group upon written request. The Division shall maintain a mailing list for distribution of public notices and fact sheets. Any person or group may request that their names be added to the mailing list. The request should be in writing to the Division office in Atlanta and shall be renewed in December of each year. Failure to renew the request shall result in the removal of such name from the mailing list.

(v) The Division shall provide a period of not less than thirty (30) days following the date of the public notice in which interested persons may submit their written views on the tentative determination with respect to the NPDES Permit Application. All written comments submitted during the thirty (30) day comment period will be retained by the Division and considered in the final determination with respect to the permit application. The comment period may be extended at the discretion of the Director.

(vi) The contents of the public notice will be in accordance with Federal Regulations, 40 C.F.R. 124.32 (c), and applicable State laws.

(vii) The Division will prepare and distribute a fact sheet in accordance with Federal Regulations, 40 C.F.R. 124.33, and applicable State laws. A copy of the fact sheet will be available for public inspection at the Division office in Atlanta. Any person may request in writing a copy of the fact sheet and it will be provided. The Division shall add the name of any person or group upon request to the mailing list to receive copies of fact sheets.

(viii) The Director will notify other appropriate governmental agencies of each complete permit application and will provide such agencies an opportunity to submit their written views and recommendations in accordance with Federal Regulations, 40 C.F.R. 124.34, and applicable State laws.

(ix) Copies of the proposed permits shall be transmitted to the Regional Administrator for review and comments in such manner as the Director and Regional Administrator shall agree.

(x) The Division shall transmit to the Regional Administrator a copy of every issued NPDES Permit, immediately following issuance, along with any and all terms, conditions, requirements or documents which are part of such permit or which affect the authorization by a permit of the discharge of pollutants.

(xi) The Division shall transmit to the Regional Administrator a copy of every issued NPDES Permit, immediately following issuance, along with any and all terms, conditions, requirements or documents which are part of such permit or which affect the authorization by the permit of the discharge of pollutants.

(c) Public Hearings:

1. The Director shall provide an opportunity for an applicant, any affected state or interstate agency, the Regional Administrator or any other interested agency, person or group of persons to request a public hearing with respect to an NPDES Permit Application. Any such request for a public hearing shall be filed within the 30-day comment period prescribed in subparagraph 391-3-6-.06 (7)(b)(v) and shall indicate the interest of the party filing such a request, the reasons why a hearing is requested, and those specific portions of the application or other NPDES form or information to be considered at the public hearing. The Director shall hold a hearing if he determines that there is sufficient public interest in holding such a hearing.

2. Any public hearing held pursuant to this subparagraph shall be held in the geographical area of the proposed discharge or other appropriate location at the discretion of the Director.

3. The Director may hold one public hearing on related groups of permit applications.

4. Public notice of any hearing held pursuant to this sub-paragraph shall be provided at least thirty (30) days in advance of the hearing date and shall be circulated in accordance with Federal Regulations, 40 C.F.R. 124.37.

(d) Public Access to Information:

1. A copy of the NPDES Permit Application, public notice, fact sheet, draft permit and other NPDES forms related thereto, including written public comments thereon and other reports, files and information not involving methods of processes entitled to protection as trade secrets, shall be available for public inspection and copying during normal business hours at the Division office in Atlanta. Effluent data shall not be considered as information entitled to protection. Public access to such information shall be in accordance with Federal Regulations, 40 C.F.R. 124.35.

2. Any information submitted in an NPDES Permit Application form, together with reports, records or plans that are considered confidential by the applicant for an NPDES Permit should be clearly labeled "Confidential" and be supported by a statement as to the reasons that such information should be considered confidential. If the Director, with the concurrence of the Regional Administrator determines that such information is entitled to confidential protection, he shall label and handle same accordingly.

3. When the information being considered for confidential treatment is contained in an NPDES form, the Director shall forward such information to the Regional Administrator for his concurrence in any determination of confidentiality.

4. Any information accorded confidential status whether or not contained in an NPDES form shall be made available, upon written request, to the Regional Administrator or his authorized representative who shall maintain the information as confidential.

(8) **Terms and Conditions of Permits.**

(a) Terms and conditions under which the discharge will be permitted will be specified on the permit issued.

(b) No NPDES Permit shall be issued authorizing any of the following discharges:

1. The discharge of any radiological, chemical, or biological warfare agent or high-level radioactive waste into navigable waters.

2. Any discharge which the Secretary of the Army acting through the Chief of Engineers finds would substantially impair anchorage and navigation.

3. Any discharge to which the Regional Administrator has objected in writing pursuant to any right to object provided the Administrator of EPA under Section 402 (d) of the Federal Act; and

4. Any discharge from a point source which is in conflict with a plan or amendment thereto approved pursuant to Section 208(b) of the Federal Act.

5. Any discharge to the territorial sea, the waters of the contiguous zone, or the oceans in the following circumstances:

(i) Prior to the promulgation of the guidelines under section 403(c) of the Act, unless the Director determines permit issuance to be in the public interest; or

(ii) After promulgation of guidelines under section 403(c) of the Act, where insufficient information exists to make a reasonable judgment as to whether the discharge complies with any such guidelines.

6. To a facility which is a new source or a new discharger, if the discharge from the construction or operation of the facility will cause or contribute to the violation of water quality standards, except as in accordance with Federal Regulations 40 C.F.R. 122.52(c).

(c) The terms and conditions specified on the permit issued shall be in accordance with Federal Regulations, 40 C.F.R. 124.45 and 124.45 and applicable State laws and regulations promulgated thereunder.

(d) The issuance of a permit does not:

1. Convey any property rights of any sort, or any exclusive privileges;

2. Authorize any injury to private property or invasion of private rights, or any infringement of Federal, State, or local laws of regulations.

(9) **Publicly Owned Treatment Works.**

(a) If the permit is for a discharge from a publicly owned treatment works, assurance shall be obtained from the applicant prior to issuance of any permit that notice shall be provided to the Director of the following:

1. Any new introduction of pollutants into such treatment works from a source which would be a new source as defined in Section 306 of the Federal Act if such source were discharging pollutants;

2. Except as to such categories and classes of point sources or discharges specified by the Director, any new introduction of pollutants into such treatment works from a source which would be subject to Section 301 of the Federal Act if such source were discharging pollutants; and

3. Any substantial change in volume or character of pollutants being introduced into such treatment works by a source introducing pollutants into such works at the time of issuance of the permit.

(b) If the permit is for a discharge from a publicly owned treatment works, the permittee shall require any industrial user of such treatment works to comply with the requirements of Sections 204 (b), 307, and 308 of the Federal Act. As a means of insuring compliance with Section 307 of the Federal Act, the permittee shall require each industrial user subject to the requirements of said Section 307 to forward to the Director periodic notice of progress (over intervals not to exceed 9 months) toward full compliance with Section 307 requirements.

(c) If the permit is for a discharge from a publicly owned treatment works, the permittee shall identify, in terms of character and volume of pollutant, any significant indirect dischargers into such treatment works subject to pretreatment standards under Section 307(b) of the Federal Act and 40 C.F.R. 403.

(10) **Schedules of Compliance.**

(a) Any person who obtains an NPDES Permit or other discharge permit pursuant to the Act but who is not in compliance with applicable effluent standards and limitations or other requirements contained in such permit at the time same is issued, shall be required to achieve compliance with such standards and limitations or other requirements in accordance with a schedule of compliance as set forth in such permit, or in the absence of a schedule of compliance, by the date set forth in such permit which the Director has determined to be the shortest, reasonable period of time necessary to achieve such compliance.

(b) In any case where the period of time of compliance specified in sub-paragraph 391-3-6-.06(10)(a) of these Rules exceeds 9 months, a schedule of compliance shall be specified in the permit which will set forth interim requirements and the dates for their achievement. In no event shall more than 9 months elapse between interim dates, and, to the extent practicable, shall fall on the last day of the months of March, June, September and December.

(c) Within Fourteen (14) days after an interim date of compliance or the final date of compliance specified in such permit, the permittee shall provide the Director with written notice of his compliance or noncompliance with the requirements or conditions specified to be completed by such date. Failure to submit the written notice is just cause for the Division to pursue enforcement action pursuant to the Act.

(d) On the last working day of the months of February, May, August, and November, the Director shall prepare and submit to the Regional Administrator a list of all dischargers holding NPDES Permits which, as of the thirty (30) days prior to the date of the list, have submitted to the Director a report showing noncompliance with the requirements set forth in the permit and those which have not filed a timely report. The noncompliance list shall be available to the public at appropriate Division offices for inspection and copying, and shall contain the following information:

1. The name and address of each noncomplying permittee;

2. A concise description of the nature of noncompliance;

3. A description of proposed actions to be taken by the Division or the permittee to correct the noncompliance; and

4. Any other information deemed necessary by the Division to explain or mitigate an instance of noncompliance.

5. Any details which tend to explain or mitigate an instance of noncompliance.

(e) Noncompliance with NPDES permit requirements by major dischargers shall be reported in the following instances:

1. Failure to complete construction element(s);

2. Failure to complete or provide compliance schedule reports;

3. Noncompliance with applicable standards and limitations;

4. Failure to report effluent data;

5. Deficient reports such that the required reports cause misunderstanding by the Division and thus impede the review of the status of noncompliance;

6. Modifications to schedules of compliance constituting the basis for a modification under subparagraph 391-3-1-.06(12).

Comments: Noncompliance reported under paragraph (e) shall be reported in successive reports until the noncompliance is resolved. The resolution of noncompliance shall be reported, and when the noncompliance is reported as resolved, it will not appear in subsequent reports.

(f) Any discharger who fails or refuses to comply with an interim or final date of compliance specified in a permit may be deemed by the Director to be in violation of the permit and may be subject to enforcement action pursuant to the Act.

(11) **Monitoring, Recording and Reporting Requirements.** Any discharge authorized by a permit issued pursuant to the Act may be subject to such monitoring, recording and reporting requirements as may be reasonably required by the Director including the installation, use and maintenance of monitoring equipment or methods; specific requirements for recording of monitoring activities and results; and periodic reporting of monitoring results. The monitoring, recording and reporting requirements shall be specified in a permit when issued, provided, however, the Director may modify or require additional monitoring, recording and reporting by written notification to the permittee.

(a) The monitoring requirement of any discharge authorized by any such permit shall be consistent with Federal

Regulations, 40 C.F.R. 124.61 and applicable State laws.

(b) Any permit which requires monitoring of the authorized discharge shall comply with the recording requirements specified by Federal Regulations, 40 C.F.R. 124.62 and applicable State laws. The permittee shall be required to retain any records of monitoring activities and results for a minimum of three (3) years, unless otherwise required or extended by the Director upon written notification.

(c) Any holder of a permit which requires monitoring of the authorized discharge shall report periodically to the Division the results of all required monitoring activities on appropriate forms supplied by the Division. The Director shall notify the permittee of the frequency of reporting but in no case shall the reporting frequency be less than once per year.

(12) **Modification, Suspension and Revocation of Permits.**

(a) The Director may revise or modify the schedule of compliance set forth in an issued permit if the permittee requests such modification or revision in writing and such modification or revision will not cause an interim date in the compliance schedule to be extended more than one hundred twenty (120) days or affect the final date in the compliance schedule. If the permittee requests in writing a modification or revision of a schedule of compliance set forth in an issued permit which, if granted, would cause an interim date in the compliance schedule to be extended more than one hundred twenty (120) days or affect the final date in the compliance schedule, the Director may revise or modify such schedule of compliance if within thirty (30) days following receipt of notice of such request from the Director, the Regional Administrator does not object to same in writing and file such written objection with the Director. The Director may grant requests in accordance with this subparagraph if he determines after a documented showing by the permittee that good and valid cause (including Acts of God, strikes, floods, material shortages or other events over which the permittee has little or no control) exists for such revision.

(b) The Director may modify, suspend or revoke an issued permit in whole or in part during its term for cause, including, but not limited to, failure or refusal of the permittee to carry out the requirements listed in Federal Regulations, 40 C.F.R. 124.45(c), the causes listed in Federal Regulations, 40 C.F.R. 124.45(b), or the causes listed in the Act or regulations promulgated pursuant thereto, if within thirty (30) days following receipt of notice of such proposed modification, suspension or revocation from the Director, the Regional Administrator does not object to same in writing and file such written objection with the Director. Prior to any such modification, suspension or revocation of an issued permit by the Director (other than modification or revision of a compliance schedule pursuant to subparagraph (a) above or modification of monitoring, recording or reporting requirements), the Director will provide public notice in accordance with the procedures set forth in subparagraph 391-3-6.-06 (7)(b) and an opportunity for public hearing in accordance with the procedures set forth in subparagraph 391-3-6-.06 (7)(c).

(c) In the case of a POTW which has received a grant under Section 202 (a)(3) of the Federal Act to fund 100% of the costs to modify or replace facilities construction with a grant for innovative and alternative wastewater technology under Section 202(a)(2), the schedule of compliance may be modified to reflect the amount of time lost during construction of the innovative or alternative facility. In no case shall the compliance schedule be modified to extend beyond an applicable statutory deadline for compliance.

(d) New sources, new dischargers, sources which recommence discharging after terminating operations and those sources which had been indirect dischargers which commence discharging directly into navigable waters do not qualify for compliance schedules under this paragraph and are subject to Federal Regulations, 40 C.F.R. 122.66(d)(4).

(13) **Non-governmentally Owned Sewerage Systems.** In cases involving non-governmentally owned sewerage systems, a trust indenture or other legal contract or agreement, approved by the Division, assuring continuity of operation of the system, shall be filed with the application for a permit. This provision shall not be applicable to systems discharging only industrial waste.

(14) **Control of Disposal of Pollutants into Wells.** If the permit proposes to discharge to a well or subsurface water, the Director shall specify additional terms and conditions which shall (a) prohibit the proposed disposal, or (b) control the proposed disposal in order to prevent pollution of ground and surface water resources and to protect the public health and welfare. Any permit issued for the disposal of pollutants into wells shall comply with Federal Regulations, 40 C.F.R. 124.80, and applicable State laws.

(15) **Duration of Permits.** (a) Any permit issued under Section 10 (3) and (4) of the Act shall have a fixed term not to exceed five (5) years. Upon expiration of such permit, a new permit may be issued by the Director in accordance with Section 10 (6) of the Act and Federal Regulations, 40 C.F.R. 124.52, provided that an application for such new permit is filed with the Director at least 180 days prior to the expiration date of the existing permit. The issuance of such new permit shall likewise have a fixed term not to exceed five (5) years.

(b) A permit may be transferred to another person by a permittee in accordance with 40 C.F.R. 122.14 if:

1. The permittee notifies the Director of the proposed transfer;

2. A written agreement containing a specific date for transfer of permit responsibility and coverage between the current and new permittees (including acknowledgement that the existing permittee is liable for violations up to that date, and that the new permittee is liable for violations from that date on) is submitted to the Director; and

3. The Director within thirty (30) days does not notify the current permittee and the new permittee of the Division's intent to modify, revoke and reissue, or terminate the permit and to require that a new application be filed rather than agreeing to the transfer of the permit.

Comment: A new application will be required where the change of ownership is accompanied by a change or proposed change in process or wastewater characteristics or a change or potential change in any circumstances that the Director believes will affect the conditions or restrictions in the permit.

(c) When the permittee has submitted a timely and sufficient application for a new NPDES permit and the Director is unable, through no fault of the permittee, to issue the new permit before the expiration date of the existing permit, then the Director shall extend the existing permit until a new permit is issued.

(d) For those industrial categories for which EPA will establish effluent limitations based on best available technology, permits will be issued to insure compliance with the effluent limits by the statutory deadline. This will be accomplished by utilizing short term permits and/or reopener clauses that will allow the permit to be modified, revoked, or reissued to comply with limitations promulgated pursuant to the Act and subsequent regulations.

(e) Notwithstanding subparagraph (a) above, if a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is established under Section 307(a) of the Act for a toxic pollutant which is present in a discharge and such standard or prohibition is more stringent than any limitation for such pollutant in a permit, the permit shall be revised or modified in accordance with the

toxic effluent standard or prohibition and the permittee so notified.

(16) **Enforcement.** Any person who violates any provision of the Act, any rule promulgated and adopted pursuant thereto, or any term, condition, schedule of compliance or other requirement contained in a permit issued pursuant to the Act shall be subject to enforcement proceedings pursuant to the Act.

391-3-6-.07 Surface Water Withdrawals.

(1) **Purpose.** This chapter establishes procedures to be followed in obtaining a permit to withdraw, divert or impound surface waters of the State. It sets forth the types of information to be supplied on a permit application. It also outlines the procedures for granting, denying, revoking and modifying such permits.

(2) **Definitions.** Whenever a term appears in this Chapter which has been defined in the Georgia Water Quality Control Act (Ga. Laws 1964, p. 416 et seq., as amended) or which is defined below, such definition shall apply.

(a) "Withdrawal" shall mean the taking away of surface water from its natural course.

(b) "Diversion" shall mean, a turning aside or altering of the natural course of surface water.

(c) "Impoundment" shall mean the storing or retaining of surface water by whatever method or means.

(d) "Basin" shall mean the area from which surface runoff is carried away by a single drainage system.

(e) "Surface water(s) of the State" or "surface water(s)" shall mean any and all rivers, streams, creeks, branches, lakes, reservoirs, ponds, drainage systems, springs producing in excess of 100,000 gallons per day, and all other bodies of surface water, natural or artificial, lying within or forming a part of the boundaries of the State which are not entirely confined and retained completely upon the property of a single individual, partnership or corporation.

(f) "Director" shall mean the Director of the Environmental Protection Division of the Department of Natural Resources, State of Georgia.

(g) "Farm uses" shall mean irrigation of farmland, provision of water supply for farm animals, poultry, farming, or any other activity conducted in the course of farming operations.

(h) "Domestic and personal uses" shall mean uses of drinking, cooking, washing, sanitary purposes, and all health related activities.

(3) **Permit Required.**

(a) After July 1, 1977, any person who, on a monthly average, withdraws more than 100,000 gallons of surface water per day, diverts surface water so as to reduce the flow by more than 100,000 gallons per day at the point where the watercourse, prior to diversion, leaves the property on which the diversion occurs; or constructs an impoundment which reduces the flow of surface water by more than 100,000 gallons per day downstream of the impoundment, must obtain a permit from the Director prior to any such withdrawal, diversion or impoundment subject to the following exceptions:

1. Exceptions — No permit shall be required for the following:

(i) Any diversion accomplished as part of construction for transportation purposes which does not reduce the flow of surface waters in the diverted watercourse by more than 150,00 gallons per day on a monthly average;

(ii) Any withdrawal or diversion of surface waters for farm uses;

(iii) Any reduction of flow of surface waters during the period of construction of an impoundment, including the initial filling of the impoundment;

(iv) Any farm pond or farm impoundment constructed and managed for the sole purpose of fish, wildlife, recreation or other farm uses;

(v) Any withdrawal, diversion or impoundment of surface waters which is taking place as of July 1, 1977, for so long as it takes the Director to act upon an application for a permit to make such withdrawal, diversion or impoundment; provided such application has been filed with the Director within one hundred eighty (180) days after July 1, 1977, and provided further that such operation does not present an immediate health hazard to the public.

(4) **Permit Application.**

(a) All applications shall be on forms furnished by the Division.

(b) The applications shall include:

1. Name and address of applicant.
2. Dating of filing.
3. Source of water supply.
4. Quantity applied for.
5. Use to be made.
6. Place of use.
7. Location of withdrawal, diversion or impoundment plotted on a U.S. Geological Survey, 7½ minute quadrangle map or latest county highway map.
8. Any other information deemed necessary, provided however, any information already provided to the Director in connection with prior dealings with the Division may be incorporated into the application by specific and detailed reference and a statement that the information is still valid and correct.

(5) **System of Classification for Competing Permit Applications.**

(a) In situations involving competing applications for a supply of available surface water, the Division shall consider:

1. the number of persons using the particular water source and the object, extent and necessity of their respective withdrawals or uses;
2. nature and size of water source;
3. low flows during droughts of record;
4. any water quality of the water source which would adversely affect its availability or fitness for use;
5. the probable severity and duration of low flows, poor water quality or other impairments of the water source which would adversely affect its availability or fitness for use;
6. the injury to public health, safety or welfare which would result if such impairment were not prevented or abated;
7. the kinds of businesses or activities to which the various uses are related and the economic consequences;
8. the importance and necessity of the uses claimed by permit applicants and the extent of any injury or detriment caused or expected to be caused to other water uses;
9. diversion from or reduction of flows in other watercourses;
10. the prior investments of any person in lands, and plans for the usage of water in connection with such lands, which plans have been submitted to the Director within a reasonable time after July 1, 1977, provided that the granting of such a permit shall not have unreasonably adverse effects upon other water uses in the area including potential as well as present use;
11. the varying circumstances of each use.

(6) **Priorities for Competing Applications**

(a) When there are competing applications for water from the same source, and the source is insufficient to supply all applicants, the following order or priorities shall prevail:

1. Emergency facilities for essential life support measures.
2. Domestic and personal uses, including drinking, cooking, washing, sanitary purposes and all health related activities.
3. Processing perishable agricultural products where minimum quantities of water are required by state or federal law or regulation.
4. Industrial Uses (including those industries on public water systems).
5. Other uses such as lawn sprinkling, non-commercial car washing, garden watering, etc.
6. Outdoor recreational uses.

(b) Competing applications within the above categories shall be assigned a priority rating based upon a consideration of the facts set forth in subsection 391-3-6-.07(5) of these Rules. In the event two or more competing applicants qualify equally under the priority rating, the Director will grant permits to such competing applicants for use of specified quantities of

surface water on a prorated or other reasonable basis in those situations where such action is feasible, provided, however, that the Director will give preference to a renewal application over an initial application.

(c) Notwithstanding the above priorities, in any case where a permit applicant can prove to the Director's satisfaction that the applicant was withdrawing, diverting or impounding surface water prior to the effective date of this Section, the Division shall take into consideration the extent to which such prior withdrawal, diversion or impoundment was reasonably necessary in the judgment of the Director to meet his needs including the needs of any third party to whom the permit applicant was furnishing water for the processing of perishable agricultural products which require minimum quantities of water to comply with state or federal laws or regulations, and shall grant a permit which shall meet those reasonable needs, provided, however, that the granting of such permit shall not have unreasonable adverse effect upon other water uses in the area, including but not limited to public use and potential as well as present use, and provided, further, however, notwithstanding the above, that the Director shall grant a permit to any permit applicant who on the effective date of this Act has outstanding indebtedness in the form of revenue certificates or general obligation bonds which are being amortized through the sale of surface water, the permitted quantity of such shall be at least in an amount consistent with the quantity for which the revenue certificates or general obligation bonds were issued.

(7) **Duration of Permits.** Any permit granted for the withdrawal, diversion or impoundment of surface waters shall be for a period of times not less than ten (10) years (unless the applicant requests a shorter period of time) nor more than twenty (20) years; provided, however, the Director may authorize a permit of duration of up to fifty (50) years in the case of a municipality or other governmental body where such period is required to provide for the retirement of bonds for the construction of water works or waste disposal facilities.

(8) **Renewal of Permits.** All permittees desiring to renew their permit shall submit an application for renewal to the Director within six (6) months prior to its expiration. All renewals will be treated in the same manner as the initial permit.

(9) **Revocation, Suspension, or Modification of Permits.**

(a) Any permit granted for the withdrawal, diversion or impoundment of surface waters may be revoked, in whole or in part, permanently or temporarily, for the following reasons:

1. any material false statement in an application for a permit or in any report required to be made;

2. any willful violation of a condition of a permit;

3. nonuse of the water supply (or a significant portion thereof) allowed by a permit for a period of two (2) consecutive years or more, unless the permittee can reasonably demonstrate that his nonuse was due to extreme hardship caused by factors beyond his control;

4. with the written consent of the permittee.

(b) Any such permit may be revoked, in whole or in part, for a period not to exceed one (1) year for violation of any provision of Section 10(A) of the Georgia Water Quality Control Act.

(c) Any such permit may be suspended or modified if the Director should determine that the quantity of water allowed under the permit is greater than that needed by the permittee for the particular use upon which the application for permit was based.

(d) Any such permit may be revoked, suspended or modified for any other good cause consistent with the health and safety of the citizens of this State and within the provisions of this Act.

(e) In the event of modification, suspension or revocation of permit the Director shall serve written notice of such action on the permit holder and give the reason for such action.

(10) **Emergency Water Shortage.** Any permit may be suspended, restricted or otherwise modified by emergency order of the Director when an emergency period of water shortages exists. Prior to any such action, it must clearly appear to the Director from specific facts shown by affidavit of any resident of the affected area of this State that an emergency period of water shortage exists within such area, so as to place in jeopardy the health or safety of the citizens of such area or to threaten serious harm to the water resources of the area. Any permittee has five (5) days from the date of mailing of the notice of the proposed change in the permit to appear in opposition to the proposed action. Any change, suspension or restriction in the permit is effective immediately upon receipt of such order by the permittee, his agent for service of process, or any agent or employee of the permittee who receives the notification at the permittee's principal place of business in the State, but upon application, the permittee shall be afforded a hearing before a hearing officer appointed by the Department of Natural Resources within twenty (20) days of receipt of said application by the hearing officer. In the event of dire emergency, only water for domestic and personal uses, for drinking, cooking, washing, sanitary purposes and all health related activities will be permitted. All other usages will be established by the Director based on the priorities established in Subsection 391-3-6-.07(6). Upon expiration of the emergency period of water shortage, the permittee will be notified in writing of such expiration and the said permittee may then operate under the permit as issued prior to the emergency.

(11) **Request for Modification of Unexpired Permit.** A permittee may seek modification of any of the terms of an unexpired permit. The Director may modify such permit provided the permittee established at least one of the following:

(a) a change in conditions has resulted in a need by the permittee of more water than is allowed under the existing permit;

(b) the proposed modification would result in a more efficient utilization of water than is possible under the existing permit; or

(c) a proposed change in conditions would result in a need by the permittee of more water than is allowed under the existing permit. Any such modification shall be consistent with the health and safety of the citizens of this State and with the provisions of this Act.

(12) **Public Notification.**

(a) Interbasin Transfer Permits.

1. A press release regarding the proposed issuance of a permit for interbasin transfer of surface water shall be given to newspapers of general circulation in all areas which would be affected by such issuance.

2. The press release shall be issued at least seven (7) days before issuance of the permit.

3. If the Director determines sufficient public interest, he shall hold a hearing somewhere within the area affected prior to the issuance of the permit.

(b) Intrabasin Permits.

1. A press release regarding the issuance of a permit shall be sent to Counties for posting in the Courthouse of the County in which the withdrawal occurs.

2. A public notice regarding the proposed issuance of a permit shall be provided to one or more newspapers of general circulation in the area of the applicant.

3. A press release regarding the proposed issuance of a permit shall be issued by the Department of Natural Resources and released through its usual channels.

(13) **Records.** Whenever required to carry out the objectives of Section 10(A) of the Georgia Water Quality Control Act, the Director may by order, permit or otherwise, in writing, require any person holding a permit or any other person who the Director reasonably believes is unlawfully withdrawing, diverting or impounding surface waters to:

(a) establish and maintain records;

(b) make reports;

(c) install, use and maintain monitoring equipment or methods;

(d) other information as required; provided any information already provided to the Director in connection with prior dealing with the Division may be incorporated into the records or reports by specific and detailed reference and a statement that the information is still valid and correct.

(14) **Enforcement.** The administration and enforcement of these Rules shall be in accordance with the Georgia Water Quality Control Act and the Georgia Administrative Procedure Act.

(15) **Effective Date.** This rule shall become effective on February 22, 1978.

391-3-6-.08 Pretreatment and Permit Requirements.

(1) **Purpose.** The purpose of this Paragraph 391-3-6-.08 is to provide for the degree of wastewater pretreatment required and the uniform procedures and practices to be followed relating to the application for and the issuance or revocation of pretreatment permits for the discharge of any pollutant into a publicly owned treatment works and then into the waters of the State.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in this Paragraph or in any other Paragraph of these Rules;

(a) "Act" means the Georgia Water Quality Act, as amended.

(b) "Federal Act" means the Federal Water Pollution Control Act, also known as the Clean Water Act, as amended.

(c) "Significant source" means any industrial user that:

1. is subject to any national pretreatment standard promulgated by the Environmental Protection Agency (EPA) in accordance with Section 307(b) and (c) of the Federal Act;

2. has in its waste a toxic pollutant in toxic amounts as defined in standards issued under Section 307(a) of the Federal Act; or

3. significantly interferes with, either singly or in combination with other contributing industries, the treatment works or the quality of its effluent.

(d) "Limitation" means any restriction or prohibition established under the Act on quantities, rates, or concentrations, or a combination thereof, of chemical, physical, biological, or other constituents which are discharged from significant sources into a publicly owned treatment works and then into the waters of the State, including but not limited to schedules of compliance.

(e) "Pretreatment permit application" means an application filed by any person with the Director for a pretreatment permit.

(f) "Pretreatment permit" means any permit issued by the Division to regulate the discharge of pollutants from any significant source into a publicly owned treatment works and the waters of the State.

(g) "Industrial User" means any person discharging or proposing to discharge any pollutant into a publicly owned treatment works and then into waters of the State.

(h) "Interference or Interfere" means inhibition or disruption of a Publicly Owned Treatment Works' (POTW's) sewer system, treatment processes or operations which causes or significantly contributes to a violation of any requirement of its NPDES Permit. The term includes prevention of sewage sludge use or disposal in accordance with Section 405 of the Federal Act, or any criteria, guidelines, or regulations developed pursuant to State or Federal water, land or air protection laws.

(i) "Person" means any individual, corporation, company, association, partnership, county, municipality, State agency, Federal agency or facility or other entity.

(3) **Pretreatment Permit Requirement**

(a) Any person discharging or proposing to discharge any pollutant from a significant source into a publicly owned treatment works and then into the waters of the State, under any of the circumstances described in Section 10(3) of the Act, shall obtain a permit from the Division to make such a discharge, unless such discharge is to a publicly owned treatment works operating under a pretreatment program approved by the Director.

(4) **Degree of Pretreatment Required**

(a) All pollutants discharged from a significant source to a publicly owned treatment works and then into the waters of the State shall receive such pretreatment or corrective action so as to insure compliance with the terms and conditions of the issued pretreatment permit and with the following whenever applicable:

1. Limitations, prohibitions and pretreatment standards and requirements promulgated by the EPA pursuant to Section 307 of the Federal Act.

2. Until such time as such limitations, prohibitions and pretreatment standards and requirements are formally promulgated pursuant to Section 307 of the Federal Act, the Division shall apply such limitations, prohibitions and pretreatment standards necessary to achieve the purposes of said Section of the Federal Act. With respect to the significant sources, such limitations, prohibitions or pretreatment standards shall be based upon an assessment of technology and processes to wit:

(i) to existing significant sources limitations or pretreatment standards and requirements based on application of the best demonstrated control technology currently available;

(ii) to any significant source whose construction commences after the effective date of this Paragraph, pretreatment standards and requirements which reflect the greatest degree of effluent reduction which the Division determines to be achievable through the application of best demonstrated control technology currently available, or changes in processes or operating methods or other alternatives including where practical any standard permitting no discharge of pollutants.

3. Notwithstanding the above, more stringent pretreatment may be required as deemed necessary by the Division to meet:

(i) any other existing Federal laws or regulations;

(ii) to insure compliance with any applicable State water quality standards, effluent limitations, pretreatment standards and requirements, or schedule of compliance;

(iii) to insure there is no interference with the operation of a POTW.

4. To any significant source, as appropriate, pretreatment standards and requirements designed to prohibit the discharge of toxic pollutants in toxic amounts which interfere with, pass through, prevents the use or disposal of sewage sludge, or otherwise interferes with the operation of publicly owned treatment works.

5. The foregoing requirements shall be applied in considering all applications for pretreatment permits made pursuant to Section 10 of the Act and no such application shall be approved unless the pretreatment facilities will achieve such pretreatment standards and requirements within such reasonable time thereafter as the Division may require.

(5) **Application for Pretreatment Permit.**

(a) Applications for pretreatment permits under Section 10 of the Act shall be on forms as may be prescribed and furnished from time to time by the Division. Applications shall be accompanied by all pertinent information as the Division may require in order to establish pretreatment standards and requirements in accordance with Sub-Paragraph 391-3-6-.08(4), including but not limited to complete engineering reports, schedule of progress, plans, specifications, maps, measurements, quantitative and qualitative determinations, records and all related materials.

(b) Engineering reports, plans, specifications and other materials submitted to the Division in support of a pretreatment application shall be prepared by a professional engineer, competent in

the field of sewage and industrial waste treatment.

(c) Materials submitted shall be complete and accurate.

(d) Any pretreatment permit application forms of any other forms submitted to the Division shall be signed as follows:

1. for a corporation by a principal executive officer of at least the level of vice president, or his duly authorized representative, if such representative is responsible for the overall operation of the facility from which the discharge described in the pretreatment permit application form originates;

2. for a partnership by a general partner;

3. for a sole proprietorship by the proprietor;

4. for a municipal, state or other public facility by either a principal executive officer, ranking elected official or other duly authorized employee.

(6) **Receipt and Use of Pretreatment Permit Application Forms and Data.**

(a) Applications for pretreatment permits will be reviewed together with such other information as may be necessary to ascertain the effect of the discharge of any pollutant into a publicly owned treatment works and then into the waters of the State.

(b) The Division shall receive any relevant data collected by the owner or operator of the publicly owned treatment works which will receive the discharge from the significant source intended to clarify or support the pretreatment permit application.

(c) Any information submitted in a pretreatment permit application form, together with reports, records or plans that are considered confidential by the applicant for a pretreatment permit should be clearly labeled "Confidential" and be supported by a statement as to the reasons that such information should be considered confidential. If the Director determines that such information is entitled confidential protection, he shall label and handle the same accordingly.

(7) **Notice and Public Participation.**

(a) Tentative determination and draft permits:

1. When the Division is satisfied that the application is complete, a tentative determination will be made to issue or deny the pretreatment permit. If the tentative determination is to issue the permit, a draft permit will be prepared in accordance with applicable Federal regulations and State laws prior to the issuance of a public notice. If the tentative determination is to deny the permit the applicant will be notified in writing by the Director and such notification shall include suggested revisions and modifications necessary to meet the requirements for a pretreatment permit.

(b) Public Notice:

1. Public notice of every approvable pretreatment permit application will be prepared and circulated in a manner designed to inform interested and potentially interested persons of the proposed discharge and of the proposed determination to issue a permit for the proposed discharge by a significant source into a publicly owned treatment works and then into the waters of the State. Procedures for circulation of the public notice shall include the following:

(i) publication in one (1) or more newspapers of general circulation in the area of the applicant;

(ii) a copy of the public notice shall be mailed to the pretreatment permit applicant and the owner or operator of the publicly owned treatment works that is to receive the discharge from the significant source. A copy shall be available for review and inspection at the Division office in Atlanta;

(iii) mailing of the public notice to any persons or group upon written request to the Division. The Division shall maintain a mailing list for distribution of public notices for pretreatment permits. Any person or group may request that their names be added to the mailing list. The request should be in writing to the Division office in Atlanta and shall be renewed in December of each year. Failure to renew the request shall result in the removal of such name from the mailing list for pretreatment permit notification;

(iv) a copy of the public notice shall be available for review and inspection at the Division office in Atlanta;

(v) the Division shall provide a period of not less than thirty (30) days following the date of the public notice in which interested persons may submit their written views on the tentative determination with respect to the pretreatment permit application. All written comments submitted during the 30 day comment period will be retained by the Division and considered in the final determinations with respect to the pretreatment permit application. The comment period may be extended at the discretion of the Director.

(c) Public Hearing:

1. The Director shall provide an opportunity for an applicant, any affected state or interstate agency, or any other interested agency, person or group of persons to request a public hearing with respect to a pretreatment permit application. Any such request for a public hearing shall be filed with the thirty (30) day, comment period prescribed in Sub-Paragraph 391-3-6-.08 (7)(b) 1.(v) and shall indicate the interest of the party filing such requests, reasons why a hearing is requested and those specific portions of the application or other pretreatment form or information to be considered at the public hearing. The Director shall hold a hearing if he determines that there is sufficient public interest in holding such a hearing.

2. Any public hearing held pursuant to this Sub-Paragraph shall be held in geographical area of the proposed discharge to the publicly owned treatment works and then into the waters of the State or other appropriate location at the discretion of the Director.

3. The Director may hold one public hearing on related groups of pretreatment permit applications.

4. Public notice of any hearing held pursuant to this Sub-Paragraph shall be provided at least thirty (30) days in advance of the hearing date and shall be circulated in accordance with the public notification procedures in Sub-Paragraph 391-3-6-.08(7)(b).

(8) **Terms and Conditions of Pretreatment Permits.**

(a) Terms and conditions under which the discharge will be permitted will be specified on the permit issue for the significant source to discharge into the publicly owned treatment works and then into the waters of the State.

(b) No pretreatment permit shall be issued authorizing the discharge into a publicly owned treatment works and then into the waters of the State of any radiological, chemical or biological warfare agent or high-level radioactive waste.

(c) Schedule of compliance:

1. Any person who obtains a pretreatment permit pursuant to the Act but who is not in compliance with applicable pretreatment standards and limitations or other requirements contained in such permit at the time same is issued, shall be required to achieve compliance with such pretreatment standards and limitation or other requirements in accordance with the schedule of compliance as set forth in such permit, or in the absence of a schedule of compliance, by the date set forth in such permit which the Director has determined to be the shortest, reasonable period of time necessary to achieve compliance.

2. Within 14 days after an interim date of compliance or the final date of compliance specified in a pretreatment permit, the permittee shall provide the Director with written notice of his compliance or non-compliance with the requirements and conditions specified to be completed by such date. Failure to submit the written notice is just cause for the Division to pursue enforcement action pursuant to the Act.

3. A permittee who fails or refuses to comply with an interim or final date of compliance specified in a pretreatment permit may be deemed by the Director to be in violation of the permit and may be subject to enforcement action pursuant to the Act.

(d) Monitoring, recording and reporting requirements:

1. Any discharge to a publicly owned treatment works and then into the waters of the State authorized by a pretreatment permit issued pursuant to the Act may be subject to such monitoring, recording and reporting requirements as may be reasonably required by the Director including the installation, use and maintenance of monitoring equipment or methods; specific requirements for recording of monitoring activities and results; and periodic reporting of monitoring results. The monitoring, recording and reporting requirements shall be specified in a permit when issued, provided however the Director may modify or require additional monitoring, recording and reporting by written notification to the permittee.

2. The permittee shall be required to retain any records of monitoring activities and results for a minimum of three (3) years, unless otherwise required or extended by the Director upon written notification.

3. Any holder of a permit which requires monitoring of the authorized discharge into a publicly owned treatment works and then into the waters of the State shall report periodically to the Division results of all required monitoring activites on appropriate forms supplied by the Division. The Division shall notify the permittee of the frequency of reporting but in no case shall the reporting frequency be less than twice per year.

(9) **Modification, suspension and revocation of pretreatment permits:**

(a) The Director may revise or modify the schedule of compliance set forth in an issued pretreatment permit if the permittee requests such modification or revision in writing and such modification or revision will not cause an interim date in the compliance schedule to be extended more than 120 days or affect the final date in the compliance schedule. If the permittee requests in writing the modification or revision of a schedule of compliance set forth in an issued pretreatment permit which, if granted, would cause an interim date in the compliance schedule to be extended more than 120 days or affect the final date in the compliance schedule, the Director may revise or modify such schedule of compliance provided it is in accordance with promulgated Federal regulations. The Director may grant requests in accordance with this Sub-Paragraph if he determines after documented showing by the permittee that good and valid cause, including acts of God, strikes, floods, material shortages or other events over which the permittee has little or no control, exists for such revision.

(b) The Director may modify, suspend or revoke an issued pretreatment permit in whole or in part during its term for cause, including, but not limited to, failure or refusal of the permittee to carry out the requirements of the Act or regulations promulgated pursuant thereto and/or promulgated Federal regulations, if within 30 days following receipt of such notice of such proposed modifications, suspension or revocation from the Director there is no objection by the permittee in writing. Prior to any such modifications, suspension or revocation of an issued pretreatment permit by the Director (other than modification or revision of compliance schedule pursuant to Sub-Paragraph (a) above or modification of the monitoring, recording or reporting requirements), the Director will provide public notice in accordance with the procedures set forth in Sub-Paragraph 391-3-6-.08(7)(b). If the permittee files an objection in writing within the specified 30 day period such permittee shall be granted a hearing before a hearing officer appointed by the Board of Natural Resources. The initial hearing and any administrative review thereof shall be conducted in accordance with Section 17(a) of the Executive Reorganization Act of 1972, as amended.

(10) **Duration of Pretreatment Permits.**

(a) Any pretreatment permit issued under Section 10(3) and 10(4) of the Act shall have a fixed term not to exceed five years. Upon expiration of such permit a new pretreatment permit may be issued by the Director in accordance with Section 10(6) of the Act and promulgated Federal regulations, provided that an application for such new pretreatment permit is filed with the Director at least 180 days prior to the expiration date of the existing permit. The issuance of such new pretreatment permit shall likewise have a fixed term not to exceed five years.

391-3-6-.09 Publicly Owned Treatment Works Pretreatment Programs.

(1) **Purpose.** The purpose of Paragraph 391-3-6-.09 is to provide uniform procedures and practices to be followed for POTW Pretreatment Program requirements, the development and submission of POTW Pretreatment Programs for Division review and approval or denial and the public notification methods to be used.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in this Paragraph or in any other Paragraph of these Rules:

(a) "Publicly Owned Treatment 'Vorks" or "POTW" means the city, town, county, district, association, or other public body created by or pursuant to State law or Federal law that owns and operates a treatment works and, where approprite, shall include the treatment works, and any sewers or other appurtenances that convey wastewater to the treatment works.

(b) "Submission" means a request to the Director for approval of a Pretreatment Program by a POTW.

(3) **Required POTW Pretreatment Programs.**

(a) Any POTW or combination of POTW's operated by the same authority with a total design flow greater than 5 million gallons per day (mgd) and receiving pollutants from industrial users which may pass through untreated or interfere with the operation of the POTW or are otherwise subject to Section 307(b) or 307(c) of the Federal Act will be required to establish a POTW Pretreatment Program.

(b) The Director may require in writing that a POTW with a design flow of 5 mgd or less develop a POTW Pretreatment Program if he finds that the nature or volume of the industrial influent, treatment process upsets, violations of POTW effluent limitations, contamination of municipal sludge or other circumstances warrant a pretreatment program in order to prevent interference with the POTW or pass through of untreated pollutants.

(c) Any POTW described in Sub-Paragraphs (a) and (b) of the Sub-Section must obtain approval of its POTW Pretreatment Program no later than 3 years after the reissuance or modification of its existing NPDES permit, but in no case later than July 1, 1973. POTW's whose NPDES permits are modified under Section 301(h) of the Federal Act shall have a pretreatment program within less than three (3) years as provided by 40 CFR Part 233.

(d) The POTW Pretreatment Program shall meet the criteria set forth in 40 CFR 403.8(f) and shall be capable of being administered by the POTW to ensure compliance by the industrial users with applicable State and Federal pretreatment standards and requirements in order to be approved by the Director.

(e) The Director may hold a public hearing in the geographical area served by any POTW which fails to comply with the

Director's finding and written directive that a pretreatment program is required and a draft submission must be developed and submitted to the Division within sixty (60) days. The public hearing will be held to advise the public, the industrial users and other concerned parties that the Division will establish and operate the pretreatment program necessary to meet the Federal requirements as a result of the failure to the POTW to carry out its legal responsibility. The appropriate POTW, city or municipal officials will be requested to appear at the public hearing to explain the reasons why they failed to comply with the Director's finding and directive. For any public hearing held pursuant to this Sub-Paragraph a public notice shall be provided at least forty-five (45) days in advance of the hearing date and shall be published and circulated in accordance with Sub-Paragraph 391-3-6-.09(5)(a).

(f) A POTW requesting approval of a POTW Pretreatment Program shall develop a program submission which includes the information set forth in 40 C.F.R. 403.9, 403.8(f) and 40 C.F.R. 403.7(b) and (c) where appropriate. Any other pertinent information requested by the Director as being necessary to clarify, support or supplement the program description must also be submited.

(4) **POTW Pretreatment Program Approval or Denial.**

(a) When the Division is satisfied that a POTW Pretreatment Program meets the requirements of 40 C.F.R. 403.8(f), 403.9 and/or 403.7(b) and (c) as appropriate or such other requirements as may be prescribed by the Director, a tentative determination for approval will be prepared.

(b) When the Division determines that the POTW Pretreatment Program does not meet the requirements of Sub-Paragraph (a) of this Sub-Section, the Director shall notify the POTW in writing as appropriate. This notification shall include suggested revisions and modifications necessary to bring the program into compliance with the applicable requirements. Unless the necessary revisions and modifications are made within the time period specified by the Director in his notification of denial, the Division will proceed to develop and implement a pretreatment program for the area served by the POTW in accordance with Paragraph 391-3-6-.08.

(5) **Notice and Public Participation.**

(a) Tentative Determination for POTW Pretreatment Program Approval.

1. When the Division is satisfied that a POTW Pretreatment Program submission meets the requirements of 40 C.F.R. 403, a public notice will be issued to advise that a request has been made for approval of the submission. This public notice shall be published and circulated in a manner designed to inform interested and potentially interested persons of the submission. Procedures for circulation of the public notice shall include the following:

(i) mailing to adjoining State whose waters may be affected;

(ii) mailing to designated 208 planning agencies, Federal and State fish, shellfish and wildlife resource agencies, upon request to other appropriate government agencies, and to any other person or group, including those on the appropriate Division mailing list;

(iii) publication in the largest daily newspapers of the city or municipality in which the POTW Pretreatment Program has been established;

(iv) mailing to the chief elected official of the city or municipality requesting approval of the POTW Pretreatment Program submission;

(v) a copy will be available at the Division office in Atlanta;

(vi) the Division shall provide a period of not less than forty-five (45) days following the date of the public notice during which interested persons may submit their written views on the submission. All written comments submitted during the forty-five (45) day period will be retained by the Division and considered in the decision on whether or not to approve the submission. The comment period may be extended at the discretion of the Director;

(vii) the contents of the public notice will be in accordance with appropriate Federal requirements and applicable State laws.

(2) The Director shall provide an opportunity for the applicant, any affected State, any interested State or Federal agency, person or group of persons to request a public hearing with respect to the submission. Any such request for a public hearing shall be filed within the forty-five (45) day comment period described in Sub-Paragraph (vi) of this Paragraph and shall indicate the interest of the person filing such request and the reason why a hearing is warranted. The Director shall hold the hearing if he determines that there is sufficient public interest in holding such a hearing.

(3) Any public hearing held pursuant to this Sub-Paragraph shall be held in the geographical area of the applicable submission or other appropriate location at the discretion of the Director. The Director may hold one public hearing on related groups of submissions in the same geographical area.

(4) Public notice of any hearing held pursuant to this Sub-Paragraph shall be provided at least forty-five (45) days in advance of the hearing date and shall be circulated in accordance with Sub-Paragraph 391-3-6-.09(5)(a).1.

(b) Final Determination for POTW Pretreatment Program Approval or Denial.

1. At the conclusion of the public notice comment period or the public comment period allowed following a public hearing, the Director shall make a determination to approve the POTW Pretreatment Program or deny approval to the program based on the requirements of Sub-Paragraph 391-3-6-.09(4)(a) and taking into consideration the comments submitted during the comment period and the record of the public hearing. When the Director has made a determination to deny approval to the program the POTW shall be notified in writing in accordance with Sub-Paragraph 391-3-6-.09(4)(b).

2. When the Director has made a determination to approve the submission, a public notice will be issued to advise of the decision. This public notice shall be published and circulated in a manner designed to inform interested and potentially interested persons of the decision. Procedures for circulation of the public notice shall include the following:

(i) publication in the same newspaper as the original notice of request for approval of the submission was published;

(ii) mailing to those persons who submitted comments and participated in the hearing for approval or disapproval of the submission;

(iii) the Director shall identify in any public notice for approval of the submission and authorization to modify the categorical standards which the city or municipality has requested in accordance with 40 C.F.R. 403.7(b) and/or (c) for removal of pollutants subject to pretreatment standards;

(iv) the Director shall insure that the submission and any comments upon said submission are available to the public for inspection and copying at the Division offices in Atlanta during normal business hours;

(v) mailing to adjoining State whose waters may be affected;

(vi) mailing to designated 208 planning agencies, Federal and State fish, shellfish and wildlife resource agencies, upon request to other appropriate government agencies, and to any other person or group including those on the appropriate Division mailing list.

(6) **Notification of POTW Pretreatment Program Approval.**

(a) Notification of any final approval of a POTW Pretreatment Program will be forwarded to the POTW in writing including any conditions or special requirements for compliance schedules, monitoring and reporting both for the POTW and the industrial user in accordance with 40 C.F.R. 403.12.

(b) When the POTW accepts the approval and any specific conditions or re-

quirements that are a part of the approval notification by the Director, procedures will be started to revise, modify and reissue the NPDES discharge permit to include the authority to operate a POTW pretreatment Program as a part of the NPDES permit.

39-3-6-.10 Determinations of Categorization of Industrial Users and Requests for Fundamentally Different Factors Variances.

(1) **Purpose.** The purpose of Sub-Paragraph 391-3.6-.10 is to provide for uniform procedures and practices to be followed for the determination of categorization of industrial users and requests for variances for fundamentally different factors. Such determinations will be applicable to the approved local POTW Pretreatment Programs and the pretreatment programs supervised and operated by the Division.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in the Paragraph or in any other Paragraph of these Rules.

(3) **Determinations on Categorization of Industrial Users and Requests for Fundamentally Different Factor Variances.**

(a) Within thirty (30) days after the effective date of a pretreatment standard for a sub-category under which an industrial user believes itself to be included, the industrial user may request that the Director provide written certification to the effect that the industrial user does or does not fall within that particular category. Each request shall contain a statement:

1. describing which sub-categories might be applicable;

2. citing evidence and reasons why a particular subcategory is applicable and why others are not applicable. Each statement shall contain an oath stating that the facts contained therein are true on the basis of the applicant's personal knowledge or to the best of his information and belief. The oath shall be attested to by a notary public.

(b) The Director will act only on written requests for determinations that contain all of the information required. Persons who have made incomplete submissions will be notified by the Director that their requests are deficient and unless the time period is extended they will be given thirty (30) days to correct the deficiency. If the deficiency is not corrected within thirty (30) days or within an extended period allowed by the Director the request for a determination shall be denied.

(c) When the Director determines that all of the information required by the Sub-Paragraph, any additional evidence that may have been requested and any other available information relevant to the request has been submitted, he will make a written determination of the applicable sub-category and state the reasons for his determination. The Director shall forward the written determination described in this Sub-Paragraph to the Regional Administrator of EPA who may make a final determination. If the Regional Administrator does not modify the Director's decision within sixty (60) days after receipt thereof, the Director's decision is final.

(d) The Director shall send a copy of his determination to the persons making the request. When the final determination is made by the Regional Administrator of EPA, he shall send a copy of his determination to the Director and the Director will forward it to the person that made the request.

(e) If an industrial user fails either to seek the certification referred to in Sub-Paragraph 391-3-6-.10(3) within the prescribed 30-day period or to contest a negative determination through administrative channels provided, they will be bound by a subsequent determination made by the Director as to the sub-category under which an industrial user should be included.

(4) **Fundamentally Different Factors Variances.**

(a) Requests for a variance from categorical pretreatment standards for fundamentally different factors and supporting evidence must be submitted in writing to the Director within 90 days after promulgation by the EPA of the categorical pretreatment standards.

1. Written submissions for variance requests submitted to the Director must include:

(i) the name and address of the person making the request;

(ii) identification of the interest of the requestor which is affected by the categorical pretreatment standard for which the variance is requested;

(iii) identification of the POTW currently receiving the waste from the industrial user for which alternative discharge limits are requested;

(iv) identification of the categorical pretreatment standards which are applicable to the industrial user;

(v) a list of each pollutant or pollutant parameter for which an alternative discharge limit is sought;

(vi) the alternative discharge limits proposed by the requestor for each pollutant or pollutant parameter identified in Item (v) of this Paragraph;

(vii) a description of the industrial user's existing water pollution control facilities;

(viii) a schematic flow representation of the industrial user's water system including water supply processed wastewater systems, and points of discharge; and

(ix) a statement of facts clearly establishing why the variance requests should be approved, including detailed support data, documentation, and evidence necessary to fully evaluate the merits of the request, including technical and economic data collected by the EPA and used in developing each pollutant discharge limit in the pretreatment standard.

(b) The Director will only act on written requests for variances that contain all of the information required. Persons who have made incomplete submissions will be notified by the Director that their requests are deficient and unless the time period is extended, will be given thirty (30) days to correct the deficiency. If the deficiency is not corrected within the thirty (30) days or within an extended period allowed by the Director, the request for variance shall be denied.

(c) When the Director receives a submittal from a person making a request, he will, after determining that it contains all of the information required by Paragraph (b) of this Section, consider the submission, any additional evidence that may have been requested, and any other available information relevant to the request. The Director will then make a written finding indicating whether or not there are factors which are fundamentally different for that industrial user, for those factors considered in the development of the appropriated categorical pretreatment standards. This preliminary finding will include the reasons as to whether or not the variances should be granted.

(d) When the Director finds that fundamentally different factors do not exist, he may deny the request and notify the requestor and the industrial user, where they are not the same, of the denial.

(e) When the Director finds that fundamentally different factors do exist, he shall forward the request and a written recommendation that the request be approved to the Regional Administrator of EPA. If upon review of the recommended approval submitted by the Director, the Regional Administrator of EPA finds that fundamentally different factors do exist and that a partial or full variance is justified, he will approve the variance.

391-3-6-.11 Land Disposal and Permit Requirements.

(1) **Purpose.** The purpose of this Paragraph 391-3-6.11 is to provide for the degree of pollutant treatment required and the uniform procedures and practices to be

followed relating to the application for and the issuance or revocation of permits for the discharge of pollutants into land disposal or land treatment systems and then into the waters of the State.

(2) **Definitions.** All terms used in this Paragraph shall be interpreted in accordance with the definitions as set forth in the Act unless otherwise defined in this Paragraph or in any other Paragraph of these Rules.

(a) "Act" means the Georgia Water Quality Contol Act, as amended;

(b) "Land disposal system" means any method of disposing of pollutants in which the pollutants are applied to the surface or beneath the surface of a parcel of land and which results in the pollutants percolating, infiltrating, or being absorbed into the soil and then into the waters of the State. Land disposal systems exclude landfills and sanitary landfills but include ponds, basins, or lagoons used for disposal of wastes or wastewaters, where evaporation and/or percolation of the wastes or wastewaters are used or intended to be used to prevent point discharge of pollutants into waters of the State. Septic tank systems, as defined in Chapter 270-5-25-.01 and as approved by appropriate County Boards of Public Health, are not considered land disposal systems for purposes of Chapter 391-3-6-.11;

(c) "Land treatment system" means any land disposal system in which vegetation on the site is used to remove some of the pollutants applied;

(d) "Treatment requirement" means any restriction or prohibition established under the Act or quantities, rates, or concentrations, or a combination thereof, of chemical, physical, biological, or other constituents which are discharged into a land disposal or land treatment system and then into the waters of the State, including but not limited to schedules of compliance;

(e) "Land disposal system permit application" means an application filed by any person with the Director for a land disposal system permit;

(f) "Land disposal system permit" means any permit issued by the Division to regulate the discharge of any pollutant into a land disposal or land treatment system;

(g) "Hydraulic loading rate" is the rate at which wastes or wastewaters are discharged to a land disposal or land treatment system, expressed in volume per unit area per unit time or depth of water per unit area per unit time.

(3) **Land Disposal System Permit Requirement.** Any person discharging or proposing to discharge domestic, municipal, commercial, or industrial wastes or wastewaters into a land disposal or land treatment system and then into the waters of the State, under any of the circumstances described in Section 10 of the Act, shall obtain a permit from the Division to make such a discharge. Owners of land disposal or land treatment systems which employ overland flow, subsurface drain fields, or other techniques which result in one or more point discharges into surface waters of the State, must obtain an NPDES permit and will not be issued a land disposal system permit. The provisions of Section 391-3-6-.08 regarding pretreatment apply to publicly owned treatment works which employ land disposal or land treatment systems.

(4) **Degree of Pollutant Treatment Required.**

(a) All pollutants discharged into land disposal or land treatment systems shall receive such treatment or corrective action so as to insure compliance with the terms and conditions of the issued land disposal system permit. The Division has the authority to establish the degree of treatment required before the pollutant is discharged to a land disposal or a land treatment system and then into waters of the State.

(b) Any pollutants which are being discharged or are intended to be discharged to a land disposal or land treatment system in amounts or concentrations which could be toxic or otherwise harmful to humans or biota if those pollutants mingle with waters of the State, or in amounts or concentrations which could reduce or impair the usefulness or operation of the land disposal or land treatment system, must receive such treatment as the Division may specify prior to being discharged to the land disposal or land treatment system.

(c) The hydraulic loading rate for any land disposal or land treatment system shall be determined based upon a technical analysis of soils and vegetation in the system area, climatic data characteristics of the wastes to be disposed or treated, and previous experience with similar systems. Hydraulic loading rates may not exceed those established in guidelines issued by the Division unless such technical analysis proves to the satisfaction of the Division that higher rates can be used.

(d) No land disposal system permit shall be issued authorizing the discharge of any radiological, chemical, or biological warfare agent or high-level radioactive waste into a land disposal or land treatment system.

(5) **Application for a Land Disposal System Permit.**

(a) Applications for a land disposal system permit under Section 10 of the Act shall be on forms as may be prescribed and furnished from time to time by the Division. Applications shall be accompanied by all pertinent information as the Division may require in order to establish pollutant treatment requirements in accordance with subparagraph 391-3-6-.11(4), including but not limited to complete engineering reports, schedule of progress, plans, specifications, maps, measurements, quantitative and qualitative determinations, records and all related materials.

(b) Engineering reports, plans, and specifications submitted to the Division in support of a land disposal system permit application shall be prepared by a professional engineer, competent in the field of sewage and industrial waste treatment. Other materials in support of engineering reports, plans, specifications, and permit applications may be prepared by other persons competent in the field of land disposal or land treatment system technology.

(c) Materials submitted shall be complete and accurate.

(d) Any land disposal system permit application form or any other form submitted to the Division shall be signed as follows in accordance with the Federal Regulations 40 C.F.R. 122.6:

1. For a corporation, by a principal executive officer of at least the level of vice president;

2. For a partnership or sole proprietorship, by a general partner or the proprietor, respectively; or

3. For a municipality, State, Federal, or other public facility, by either a principal executive officer or ranking elected official.

(e) All other reports or requests for information required by the permit issuing authority shall be signed by a person designated in (d) above or a duly authorized representative of such person, if:

1. The representative so authorized is responsible for the overall operation of the facility from which the discharge originates, e.g., a plant manager, superintendent or person of equivalent responsibility;

2. The authorization is made in writing by the person designated under (d) above; and

3. The written authorization is submitted to the Director.

(f) Any changes in the written authorization submitted to the permitting authority under (e) above which occur after the issuance of a permit shall be reported to the permitting authority by submitting a copy of a new written authorization which meets the requirements of (e) 1. and 2. above.

(g) Any person signing any document under (d) or (e) above shall make the following certification: "I certify under penalty of law that I have personally examined and am familiar with the information submitted in the attached document, and based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and

complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

Comment: The permit application will be revised to incorporate this statement Where a permit program document does not contain the statement, the certification must accompany the appropriate document.

(6) **Notice and Public Participation.**

(a) Tentative determination and draft permits:

1. When the Division is satisfied that the application is complete, a tentative determination will be made to issue or deny the land disposal system permit. If the tentative determination is to issue the permit, a draft permit will be prepared in accordance with applicable State law prior to the issuance of a public notice. If the tentative determination is to deny the permit the applicant will be notified in writing by the Director and such notification shall include suggested revisions and modifications necessary to meet the requirements for a land disposal system permit.

(b) Public Notice:

1. Public notice of every approvable land disposal system permit application will be prepared and circulated in a manner designed to inform interested and potentially interested persons of the proposed pollutant discharge and of the proposed determination to issue a permit for the proposed pollutant discharge into a land disposal system and then into waters of the State. Procedures for circulation of the public notice shall include the following:

(j) Issuance of a news release to one (1) or more newspapers of general circulation in the area of the applicant;

(ii) A copy of the public notice shall be mailed to the land disposal system permit applicant and a copy shall be available for review and inspection at the Division office in Atlanta;

(iii) Mailing of the public notice to any persons or group upon written request to the Division. The Division shall maintain a mailing list for distribution of public notices for land disposal system permits. Any person or group may request that their names be added to the mailing list. The request should be in writing to the Division office in Atlanta and shall be renewed in December of each year. Failure to renew the request shall result in the removal of such name from the mailing list for land disposal system permit notification;

(iv) The Division shall provide a period of not less than thirty (30) days following the date of the public notice in which interested persons may submit their written views on the tentative determination with respect to the land disposal system permit application. All written comments submitted during the thirty (30) day comment period will be retained by the Division and considered in the final determination with respect to the land disposal system permit application. The comment period may be extended at the discretion of the Director.

(c) Public Hearing:

1. The Director shall provide an opportunity for an applicant, any affected state or interstate agency, or any other interested agency, person or group of persons to request a public hearing with respect to a land disposal system permit application. Any such request for a public hearing shall be filed within the thirty (30) day comment period prescribed in subparagraph 391-3-6-.11(6)(b) 1. (iv) and shall indicate the interest of the party filing such request, reasons why a hearing is requested and those specific portions of the application or other land disposal system form or information to be considered at the public hearing. The Director shall hold a hearing if he determines that there is sufficient public interest in holding such a hearing;

2. Any public hearing held pursuant to this subparagraph shall be held in the geographical area of the proposed pollutant discharge into a land disposal system and then into the waters of the State, or other appropriate location at the discretion of the Director;

3. The Director may hold one public hearing on related groups of land disposal system permit applications;

4. Public notice of any hearing held pursuant to this subparagraph shall be provided at least thirty (30) days in advance of the hearing date and shall be circulated in accordance with the public notification procedures in subparagraph 391-3-6.11(6)(b).

(7) **Schedule of Compliance.**

(a) Any person who obtains a land disposal system permit pursuant to the Act but who is not in compliance with applicable pollutant treatment requirements and limitations or other requirements contained in such permit at the time same is issued, shall be required to achieve compliance with such pollutant treatment requirements and limitations or other requirements in accordance with the schedule of compliance as set forth in such permit, or in the absence of a schedule of compliance, by the date set forth in such permit which the Director has determined to be the shortest reasonable period of time necessary to achieve compliance;

(b) Within 14 days after an interim date of compliance or the final date of compliance specified in a land disposal system permit, the permittee shall provide the Director with written notice of his compliance or non-compliance with the requirements and conditions specified to be completed by such date. Failure to submit the written notice is just cause for the Division to pursue enforcement action pursuant to the Act;

(c) A permittee who fails or refuses to comply with an interim or final date of compliance specified in a land disposal system permit may be deemed by the Director to be in violation of the permit and may be subject to enforcement action pursuant to the Act.

(8) **Monitoring, Recording and Reporting Requirements.**

(a) Any pollutant discharge into a land disposal or land treatment system and then into the waters of the State authorized by a land disposal system permit issued pursuant to the Act may be subject to such monitoring, recording and reporting requirements as may be reasonably required by the Director including the installation, use and maintenance of monitoring equipment or methods, including monitoring wells; specific requirements for recording of monitoring activities and results; and periodic reporting of monitoring results. The monitoring, recording and reporting requirements shall be specified in a permit when issued, provided, however, the Director may modify or require additional monitoring, recording and reporting by written notification to the permittee.

(b) The permittee shall be required to retain any records of monitoring activities and results for a minimum of three (3) years, unless otherwise required or extended by the Director upon written notification

(c) Any holder of a permit which requires monitoring of the authorized pollutant discharge into a land disposal or land treatment system and then into the waters of the State shall report periodically to the Division results of all required monitoring activities on appropriate forms supplied by the Division. The Division shall notify the permittee of the frequency of reporting but in no case shall the reporting frequency be less than once per year.

(9) **Modification, Suspension and Termination of Land Disposal System Permits.**

(a) The Director may revise or modify the schedule of compliance set forth in an issued land disposal system permit if the permittee requests such modification or revision in writing. The Director may grant requests in accordance with this subparagraph if he determines after a documented showing by the permittee that good and valid cause (including acts of God, strikes, floods, material shortages or other events over which the permittee has little or no control) exists for such revision.

(b) The Director may modify, suspend or terminate an issued land disposal system permit in whole or in part during its term for cause, including, but not limited to, failure or refusal of the permittee to carry out the requirements of the Act or regulations promulgated pursuant thereto, and if within 30 days following receipt of

such notice of such proposed modification, suspension or termination from the Director there is no objection by the permittee in writing. Prior to any such modification, suspension or termination of an issued land disposal system permit by the Director (other than modification or revision of compliance schedule pursuant to subparagraph (a) above or modification of the monitoring, recording or reporting requirements), the Director will provide public notice in accordance with the procedures set forth in subparagraph 391-3-6-.11 (6)(b) and an opportunity for public hearing in accordance with the procedures set forth in subparagraph 391-3-.11 (6)(c).

(10) **Non-governmentally Owned Sewerage Systems.** In cases involving non-governmentally owned sewerage systems, a trust indenture or other legal contract or agreement, approved by the Division, assuring continuity of operation of the system, may be required to be filed with the application for a permit. This provision shall not be applicable to systems treating or disposing only industrial waste.

(11) **Duration and Transferability of Land Disposal System Permits.**

(a) Any land disposal system permit issued under Section 10 of the Act shall have a fixed term not to exceed five years. Upon expiration of such permit a new permit may be issued by the Director, provided that an application for renewal is filed with the Director at least 180 days prior to the expiration date of the existing permit. The issuance of such new permit shall likewise have a fixed term not to exceed five years.

(b) A permit may be transferred to another person by a permittee if:

1. The permittee notifies the Director of the proposed transfer;

2. A written agreement containing a specific date for transfer of permit responsibility and coverage between the current and new permittees (including acknowledgement that the existing permittee is liable for violations up to that date, and that the new permittee is liable for violations from that date on) is submitted to the Director; and

3. The Director within thirty (30) days does not notify the current permittee and the new permittee of the Division's intent to modify, revoke and reissue, or terminate the permit and to require that a new application be filed rather than agreeing to the transfer of the permit. A new application will be required when the change of ownership is accompanied by a change or proposed change in process of wastewater characteristics or a change or a potential change in any circumstances that the Director believes will affect the conditions or restrictions in the permit.

(12) **Enforcement.** Any person who violates any provision of the Act, any rule promulgated and adopted pursuant thereto, or any term, condition, schedule of compliance or other requirement contained in a permit issued pursuant to the Act shall be subject to enforcement proceedings pursuant to the Act.

391-3-6.12 Public Wastewater Treatment Plant Classification.

In accordance with Section 5 of the Certification of Water and Wastewater Treatment Plant Operators Act (Georgia Laws 1969, p. 272, et seq., as amended) the following classifications shall be considered as minimum levels and the Division may classify any plant at a higher level if the complexity or location of the plant or critical uses of the receiving waters warrant such higher classification in the judgment of the Division. Any plant not fitting any of the following standard descriptions shall be classified individually according to the judgment of the Division.

	Design Flow (MGD)*		
Description of Treatment	Class I	Class II	Class III
Processes that are designed to provide treatment levels that are more stringent than secondary treatment definition	3.9 or Greater	0.005 to 2.99	
Activated Sludge Process, other than Extended Aeration	5.0 or Greater	0.005 to 4.99	
Extended Aeration Process	7.5 or Greater	1.00 to 7.49	.005 to 0.99
Fixed Film Biological Systems Rotating Biological Contactors, Trickling Filters, etc.	10.0 or Greater	1.0 to 9.99	.005 to 0.99
Waste Stabilization Ponds including Aerated Lagoon Systems	—	1.0 or Greater	.25 to 0.99

* NOTE: Any treatment processes with a design flow less than the minimum specified above are Class IV – a trained operator is required.

Part I

WATER USE CLASSIFICATIONS by River Basin for the Surface Waters of the State of Georgia

Stream Categories (Water-Use Classifications)

Streams and stream reaches not listed below for specific water-use classification will fit into the following categorical classifications.

(a) All stream reaches immediately downstream from point wastewater sources will be evaluated on a case-by-case basis as NPDES permits are issued for those sources. If it is determined, based on information from the U.S. Geological survey, that a stream would be intermittent, ephemeral, or a combination thereof if the flow were not sustained by treated wastewaters, such streams are classified as fishing and will be regulated under mixing zone requirements with mixing zone length and/or duration to be set on a case-by-case basis.

(b) Streams and stream reaches not specifically classified below and not covered by *a* above are classified as fishing

20-955 O—84——87

Water-Use Classifications

		CLASSIFICATION
SAVANNAH RIVER BASIN		
Savannah River	Headwaters to Clark Hill Dam (Mile 238)	Recreation
Savannah River	Clark Hill Dam (Mile 238) to Augusta, 13th Street Bridge	Drinking Water
Savannah River	U.S. Hwy. 301 Bridge (Mile 129) to U.S. Hwy. 17 Bridge (Mile 22)	Drinking Water
Savannah River	U.S. Hwy 17 Bridge (Mile 22) to Field's Cut (Mile 5)	Navigation Industrial
Savannah River	Fort Pulaski (Mile 0) to Open Sea and all littoral waters of Tybee Island	Recreation
Chattooga River	Georgia-North Carolina State Line to Tugaloo Reservoir	Wild and Scenic
West Fork Chattooga	Confluence of Overflow Creek and Clear Creek to confluence with Chattooga River (7.3 mi)	Wild and Scenic
OGEECHEE RIVER BASIN		
Ogeechee River	U.S. Hwy. 17 Bridge to Open Sea and littoral waters of Skidaway, Ossabaw, Sapelo, and St. Catherines Islands	Recreation
Little Ogeechee River	South End of White Bluff Road near Carmelite Monastery to Open Sea and littoral waters of Skidaway and Ossabaw Islands	Recreation
OCONEE RIVER BASIN		
Middle Oconee River	Georgia Hwy. 82 to U.S. Hwy. 78	Drinking Water
North Oconee River	Jackson County Road 432 to Athens Water Intake	Drinking Water
Oconee River	Georgia Hwy. 16 to Sinclair Dam	Recreation
Oconee River	Sinclair Dam to Georgia Hwy. 22	Drinking Water
Oconee River	Georgia Hwy. 57 to U.S. Hwy. 80	Drinking Water
ALTAMAHA RIVER BASIN		
	All littoral waters on the ocean side of St. Simons, Sea, and Sapelo Islands	Recreation
SATILLA RIVER BASIN		
	All littoral waters on ocean side of Cumberland and Jekyll Islands	Recreation
ST. MARYS RIVER BASIN		
North River	Headwaters to confluence with St. Marys River	Industrial
	All littoral waters on ocean side of Cumberland island	Recreation

Water-Use Classifications Contd.

		CLASSIFICATION
UPPER OCMULGEE RIVER BASIN		
South River	Headwaters to Georgia Hwy 81	Fishing[1]
Yellow River	Georgia Hwy. 124 to Porterdale Water Intake	Drinking Water
Jackson Lake	From South River at Georgia Hwy. 36; from Yellow River at Georgia Hwy 36; from Alcovy River at Newton Factory Road Bridge to Lloyd Shoals Dam	Recreation
Intrenchment Creek	Headwaters in Atlanta to confluence with South River	Fishing[1]
LOWER OCMULGEE RIVER BASIN		
Ocmulgee River	Georgia Hwy 18 to Macon Water Intake	Drinking Water
Ocmulgee River	Macon Water Intake to Georgia Hwy. 96	Fishing[1]
Towaliga River	Headwaters to Georgia Hwy 36	Drinking Water
Towaliga River	Georgia Hwy. 36 to High Falls Dam	Recreation
Tobesofkee Creek	Lake Tobesofkee	Recreation
Tobesofkee Creek	Tobesofkee Dam to confluence with Ocmulgee River	Fishing[1]
FLINT RIVER BASIN		
Flint River	Headwaters to Georgia Hwy 54	Fishing[1]
Flint River	Woolsey Road (Fayette-Clayton Counties) to Georgia Hwy 16	Drinking Water
Flint River	Georgia Hwy 27 to Georgia Power Company Dam at Lake Worth, Albany	Recreation
Flint River	Bainbridge, U S Hwy 84 Bridge to Jim Woodruff Dam, Lake Seminole	Recreation

[1] Specific criteria apply at all times, however, intermittent violations due to the impact of pollutants contained in uncontrolled storm water runoff and/or combined sewer overflows are expected

Water-Use Classifications—Contd.

CHATTAHOOCHEE RIVER BASIN		*CLASSIFICATION*
Chattahoochee River	Headwaters to Buford Dam	Recreation
Chattahoochee River	Buford Dam to Atlanta (Peachtree Creek)	Drinking Water and Recreation
Chattahoochee River	Atlanta (Peachtree Creek) to Cedar Creek	Fishing*
Chattahoochee River	New River to West Point Dam	Recreation
Chattahoochee River	West Point Dam to West Point Mfg. Company Water Intake	Drinking Water
Chattahoochee River	Osanippa Creek to Columbus, Georgia (14th Street Bridge)	Recreation and Drinking Water
Chattahoochee River	Cowikee Creek to Great Southern Division of Great Northern Paper Company	Recreation
Chattahoochee River	Georgia Hwy. 91 (Neal's Landing) to Jim Woodruff Dam	Recreation
Flat Creek	Headwaters in Gainesville to Chattahoochee River	Fishing[1]
Peachtree Creek (and its tributaries)	Headwaters to Chattahoochee River	Fishing[1]
Proctor Creek	Headwaters in Atlanta to Chattahoochee River	Fishing[1]
Utoy Creek	Headwaters in East Point to Chattahoochee River	Fishing[1]

TALLAPOOSA RIVER BASIN		*CLASSIFICATION*
Tallapoosa River	Headwaters to Georgia Hwy. 100	Drinking Water
Little Tallapoosa River	Headwaters to SCS Dam No. 36 (Carrollton Raw Water Intake)	Drinking Water

COOSA RIVER BASIN		*CLASSIFICATION*
Conasauga River	Georgia Hwy. 2 to Dalton Water Intake	Drinking Water
Ellijay River	Headwaters to Ellijay Water Intake	Drinking Water
Cartecay River	Headwaters to Ellijay Water Intake	Drinking Water
Cosawattee River	Confluence of Mountaintown Creek to Carters Dam	Recreation
Oostanaula River	Confluence of Conasauga and Coosawattee Rivers to Calhoun Water Intake	Drinking Water
Etowah River	Cherokee County Road 782 to Canton Water Intake	Drinking Water
Etowah River	Georgia Hwy. 20 to Allatoona Dam	Recreation and Drinking Water

*Condition: Specific criteria apply at all times when the river flow measured at a point immediately upstream from Peachtree Creek equals or exceeds 750 cfs (Atlanta gage flow minus Atlanta water supply withdrawal) unless violations occur due to uncontrolled urban storm runoff and/or combined sewer overflows.

[1]Specific criteria apply at all times, however, intermittent violations due to the impact of pollutants contained in uncontrolled storm water runoff and/or combined sewer overflows are expected.

Water Use Classifications Contd

		CLASSIFICATION

		Recreation
Coosa River	Alabama State Line	
Mill Creek	Headwaters to Dalton Water Supply	Drinking Water

TENNESSEE RIVER BASIN

		CLASSIFICATION
Hiawassee River (including Lake Chatuge)	Headwaters to Georgia-North Carolina State line	Recreation
Nottely River	Headwaters to Georgia-North Carolina State line	Recreation
Toccoa River (including Lake Blue Ridge)	Headwaters to Georgia-Tennessee State line	Recreation

Part II
Trout Streams of Georgia
(by River Basin and County Boundaries)

Trout Stream Designations

a) Streams designated by the Georgia Game and Fish Division as Primary [1] (Natural) Trout Waters are listed with each river basin having trout waters. Standards apply to these streams and tributaries thereto.

b) Streams designated by the Georgia Game and Fish Division as Secondary [2] (Put and Take) Trout Waters are also listed with each river basin having trout waters. Quality standards as defined in Part III of this booklet apply except for a 2 degree maximum elevation of stream temperature above natural stream temperature.

SAVANNAH RIVER BASIN

Elbert County

Primary
None
Secondary
1. Savannah River for the ten-mile reach downstream from Hartwell Dam.
Non trout
Remainder of drainage in County.

Habersham County

Primary
1. Middle Fork Broad River Watershed upstream from USFS Route 92-B.
2. Panther Creek watershed.
Secondary
1. Davidson Creek watershed.
2. Middle Fork Broad River tributaries entering below USFS Route 92-B.
3. Nancytown Creek watershed upstream from Nancytown Lake.
4. North Fork Broad River watershed.
5. Toccoa Creek watershed.
Non trout
None

Hart County

Primary
None
Secondary
1. Savannah River.
Non trout — Remainder of drainage in County.

Rabun County

Primary
1. Chattooga River — all tributaries classified as primary.
2. Tallulah River — entire stream and tributaries classified as primary except all streams or sections thereof classified as secondary or non trout.
Secondary
None
Non trout
1. Tallulah River downstream from Lake Rabun to headwaters of Tugalo Lake.

Stephens County

Primary
1. Middle Fork Broad River watershed upstream from USFS Route 92-B.
2. Panther Creek watershed upstream from the mouth of Davidson Creek.
Secondary
1. Davidson Creek watershed.
2. Big Leatherwood Creek watershed upstream from Georgia Hwy. 184 Bridge.
3. Little Toccoa Creek watershed.
4. Middle Fork Broad River watershed upstream from SCS flood control structure #44 to USFS Route 92-B.
5. North Fork Broad River watershed upstream from SCS flood control structure #1.
6. Panther Creek watershed downstream from the mouth of Davidson Creek.
7. Toccoa Creek upstream from Toccoa Falls.
Non trout
Remainder of drainage in County.

Towns County

Primary
1. Tallulah River watershed.
Secondary
None
Non trout
None

CHATTAHOOCHEE RIVER BASIN

Cobb County

Primary
None
Secondary
1. Chattahoochee River upstream from I-285 West Bridge.
Non trout
Remainder of drainage in County.

Forsyth County

Primary
None
Secondary
1. Chattahoochee River.
Non trout
Remainder of drainage in County.

Fulton County

Primary
None
Secondary
1. Chattahoochee River Upstream from I-285 West Bridge.
Non trout
Remainder of drainage in County.

Gwinnett County

Primary
None
Secondary
1. Chattahoochee River.
Non trout
Remainder of drainage in County.

Habersham

Primary
1. Chattahoochee River watershed upstream from Ga. Hwy. 255 Bridge.

[1] Waters that support a self sustaining population of rainbow, brown or brook trout.
[2] Waters in which the trout population must be replenished through periodic stockings, but will support trout throughout the year.

2. Soque River watershed upstream from King's Bridge (bridge on Ga. Hwy. 197 just below the mouth of Shoal Creek).

Secondary

1. Chattahoochee River wastershed upstream from Ga. Hwy. 115 to the Georgia Hwy. 255 Bridge.
2. Soque River watershed upstream from the mouth of Deep Creek to King's Bridge.

Non trout

Remainder of drainage in County.

Lumpkin County

Primary

1. Cane Creek watershed upstream from Cane Creek Falls.
2. Cavender Creek watershed.
3. Chestatee River watershed upstream from Lumpkin County Road 52-S976.
4. Yahoola Creek watershed upstream from Georgia Hwy. 52.

Secondary

1. Cane Creek watershed upstream from US Hwy. 19 Bridge to Cane Creek Falls.
2. Chestatee River watershed upstream from the mouth of Tesnatee Creek to Lumpkin County Road 52-S976.

Non trout

Remainder of drainage in County.

Paulding County

Primary

None

Secondary

1. Powder Creek watershed.

Non trout

Remainder of drainage in County.

Towns County

Primary

1. Chattahoochee River watershed.

Secondary

None

Non trout

None

Union County

Primary

1. Chattahoochee River watershed.

Secondary

None

Non trout

None

White County

Primary

1. Cathey Creek watershed upstream from the Arrowhead Campground Lake.
2. Chattahoochee River watershed upstream from Georgia Hwy. 255 Bridge.
3. Town Creek watershed upstream from the mouth of Jenny Creek.

Secondary

1. Chattahoochee River watershed upstream from Georgia Hwy. 115 to the Ga. Hwy. 255 Bridge.
2. Little Tesnatee Creek watershed upstream from the mouth of Turner Creek.
3. Turner Creek watershed except as listed under primary above. (Turner Creek nearest to Cleveland city limits)

Non trout

Remainder of drainage in County.

TALLAPOOSA RIVER BASIN

Carroll County

Primary

None

Secondary

1. Brooks Creek watershed.
2. Mud Creek watershed.
3. Tallapoosa River.

Non trout

Remainder of drainage in County.

Haralson County

Primary

None

Secondary

1. Beach Creek watershed upstream from Haralson County Road 34.
2. Flatwood Creek watershed.
3. Lasseter Creek watershed.
4. Mann Creek watershed upstream from Road S2708.
5. Tallapoosa River watershed upstream from Haralson County Road 222.

Non trout

Remainder of drainage in County.

Paulding County

Primary

None

Secondary

1. Tallapoosa River watershed.

Non trout

None

Polk County

Primary

None

Secondary

1. Lassetter Creek watershed.
2. Swinney Branch watershed.
3. Thomasson Creek watershed.

Non Trout

TENNESSEE RIVER BASIN

Catoosa County

Primary

None

Secondary

1. Hurricane Creek watershed upstream from Peters Branch.
2. Little Chickamauga Creek watershed upstream from County Road 387.
3. Tiger Creek watershed upstream from Georgia Hwy. 2.

Non trout

Remainder of drainage in County.

Dade County

Primary

None

Secondary

1. Higdon Creek watershed.
2. Lookout Creek watershed upstream from Georgia Hwy. 189.
3. Rock Creek watershed.

Non trout

Remainder of drainage in County.

Fannin County

Primary

1. Fightingtown Creek watershed.
2. Owenby Creek watershed.
3. Persimmon Creek watershed.
4. South Fork Rapier Mill Creek watershed.
4. Toccoa River watershed upstream to Blue Ridge Reservoir Dam.
6. Toccoa River watershed upstream from the backwater of Blue Ridge Reservoir.
7. Tumbling Creek watershed.
8. Wilscot Creek watershed.

Secondary

1. All streams or stream sections not classified as primary.

Non trout

None

Gilmer County

Primary

1. Toccoa River — Fightingtown Creek watershed.

Secondary

1. All streams or sections thereof not classified as primary.

Non trout

None

Rabun County

Primary

1. Little Tennessee River — entire stream and tributaries classed as primary except all streams or sections thereof classified as secondary or non trout.

Secondary

1. Little Tennessee River downstream from US Hwy 441 Bridge.
2. Mud Creek downstream from Sky Valley Ski Resort Lake to the Little Tennessee River.

Non trout

None

Towns County

Primary

1. Brasstown Creek watershed.
2. Gumlog Creek watershed.
3. Hiwassee River watershed — entire stream and all streams or tributaries classed as primary except all streams or sections thereof classified as secondary.
4. Winchester Creek watershed.

Secondary

1. Hightower Creek downstream from the mouth of Little Hightower Creek.

Non trout

None

Union County

Primary
1 Arkaqua Creek watershed
2 Brasstown Creek watershed
3 Conley Creek watershed upstream from Road S2325
4 Coosa Creek watershed upstream from mouth of Anderson Creek
5 Dooley Creek watershed
6 East Fork Wolf Creek watershed upstream from Lake Trahlyta
7 Gumlog Creek watershed
8 Ivylog Creek watershed upstream from USDA Forest Service property line
9 Nottely River watershed upstream from the mouth of Town Creek
10 Toccoa River watershed
11 Town Creek watershed
12 West Fork Wolf Creek watershed
13 Youngcane Creek watershed upstream from the mouth of Jones Creek

Secondary
1 All streams or sections thereof not classified as primary or as non trout

Non trout
1 Butternut Creek watershed
2 Nottely River downstream from Nottely Dam

Walker County

Primary
None

Secondary
1 Gulf Creek watershed
2 Left Fork Cooper Branch watershed
3 Little Chickamauga Creek watershed
4 Rock Creek watershed (including Sawmill Branch) upstream from Sawmill Branch
5 West Chickamauga Creek watershed upstream from Walker County Road 107

Non trout
Remainder of drainage in County

Whitfield County

Primary

A MODEL LAW TO ENABLE STATES TO PARTICIPATE IN THE NATIONAL DISCHARGE POLLUTANT ELIMINATION SYSTEM ESTABLISHED UNDER THE 1972 FEDERAL WATER POLLUTION CONTROL ACT

(The model law was developed by the Council of State Governments in February 1973)

Table of Contents

Section 1. Purpose
Section 2. Definitions
Section 3. General Powers and Duties
Section 4. Prohibition of Discharges
Section 5. Issuance of Permits
Section 6. Duration of Permits
Section 7. General Terms and Conditions of Permits
Section 8. Prohibition Against Issuing Permit in Certain Instances
Section 9. Permit Conditions Concerning Publicly Owned Treatment Works
Section 10. Pretreatment Standards
Section 11. Public Notice
Section 12. Public Hearings
Section 13. Monitoring, Recording, and Reporting
Section 14. Inspection and Entry
Section 15. Public Access to Information
Section 16. Revocation, Modification, or Suspension of Permits
Section 17. Emergency Powers
Section 18. Compliance Orders
Section 19. Injunctive Relief
Section 20. Civil Penalties
Section 21. Criminal Penalties
Section 22. State Enforcement of Certain Requirements Applicable to Persons Introducing Pollutants Into Publicly Owned Treatment Works
Section 23. Board Membership
Section 24. Water Quality Planning
Section 25. Repealer

Section 1. *Purpose*

The Legislature finds and declares that since the Federal Water Pollution Control Act (33 U.S.C. 1251, et seq.), as amended, provides for a permit system to regulate the discharge of pollutants to the waters of the United States and provides that permits may be issued by States which are authorized to implement the provisions of such Act, it is in the interest of the people of the State to enact the provisions of this Act in order to authorize the State to implement the provisions of the Federal Water Pollution Control Act and acts amendatory thereof or supplementary thereto, and Federal regulations and guidelines issued pursuant thereto.

Section 2. *Definitions*[1]

(a) The term "discharge" means the addition of any pollutant to State waters from any point source.

(b) The term "point source" means any discernible, confined and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged.

(c) The term "pollutant" means dredged spoil, soil waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials,[2] heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water. [This term does not mean (A) sewage from vessels or (B) water, gas, or other material which is injected into a well to facilitate production of oil or gas, or water derived in association with oil or gas production and disposed of in a well, if the well used either to facilitate production or for disposal purposes is approved by authority of the [appropriate State agency], and if the [appropriate State agency] determines that such injection or disposal will

[1] The definitions presented below are quite similar to those contained in the Federal Water Pollution Control Act and are designed to provide coverage of a state permit program at least as broad as is necessary to achieve approval of a State's program under section 402(b) of the Act. A program would be approvable, however, as long as the State statutory scheme is adequate to support a permit program as broad in scope as is permitted utilizing the definitions which follow. The language of a particular State statute could well be different, and quite possibly broader in scope.

The term "Director" has been used throughout this document as a shorthand method for referring to the State water pollution control agency or interstate agency or its chief administrative officer. In the event responsibility for water pollution control and enforcement is divided among two or more State or interstate agencies, the term "Director" means the administrative officer or State agency authorized to perform the particular procedure to which reference is made.

[2] The legislative history of the Federal Water Pollution Control Act Amendments reflects that the term 'radioactive materials' as included within the definition of 'pollutant' in Section 502 of the Act covers only radioactive materials which are not encompassed in the definition of source, by-product or special nuclear materials as defined by the Atomic Energy Act of 1954, as amended, and regulated pursuant to the latter Act. Examples of radioactive materials not covered by the Atomic Energy Act and, therefore, included within the term 'pollutant' are radium and accelerator produced isotopes. (H.R. Rep. 92-911, 92nd Cong. 2d Sess. 131, March 11, 1972; 117 Cong. Rec. 17401, daily ed., November 2, 1971; 118 Cong. Rec. 9115, daily ed., October 4, 1972).

Copyright © 1973 by The Bureau of National Affairs, Inc.

not result in the degradation of ground or surface water resources.[3]

(d) The term "State waters" means any and all surface and subsurface waters, [public or private,] [alternatively which are not entirely confined and retained completely upon the property of an individual, partnership or corporation,] which are contained within, flow through or border upon this State or any portion thereof,[4] including the territorial seas.

(e) The term "effluent limitations" means any restrictions or prohibitions established under State or Federal law including, but not limited to, effluent limitations, standards of performance for new sources, toxic effluent standards and ocean discharge criteria, on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources into State waters, including schedules of compliance.

(f) The term "*water quality standards*" means any water quality standards adopted and effective under State and Federal law.

(g) The term "water quality criteria" means any criteria describing the required quality of State waters adopted under State and Federal law.

(h) The term "schedule of compliance" means a schedule of remedial measures including an enforceable sequence of actions or operations leading to compliance with any effluent limitation or water quality standard.

(i) The term "person" means an individual, corporation, partnership, association, State, or political subdivision thereof, State agency, municipality, commission, or any interstate body.

(j) The term "municipality" means a city, town, borough, county, parish, district, association, waste treatment management agency, or other public body created by or pursuant to State law and having jurisdiction over disposal of sewage, industrial wastes, or other wastes, or an Indian tribe or authorized Indian tribal organization.

(k) The term "permit" means a permit to discharge pollutants into State waters issued under section 5 or section 6 of this Act.

(l) The term "industrial user" means those industries identified in the Standard Industrial Classification Manual, United States Bureau of the Budget, 1967, as amended and supplemented, under the category 'Division D — Manufacturing' and such other classes of significant waste producers identified under regulations issued by the Director or the Administrator of the United States Environmental Protection Agency.

(m) The term "publicly owned treatment works" means any facility for the treatment of pollutants owned by the State or any political subdivision thereof, municipality, or other public entity.

(n) The term "pollution" means the man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water.

Section 3. *General Powers and Duties*

The [Director] shall have the following general powers and duties:

(a) To perform any and all acts necessary to carry out the purposes and requirements of this Act and of the Federal Water Pollution Control Act, as amended, relating to this State's participation in the National Pollutant Discharge Elimination System established under the Act.

(b) To administer and enforce the provisions of this Act and all rules, regulations, orders, effluent limitations, water quality standards, and permits promulgated, issued, or effective hereunder.

(c) To advise, consult, cooperate, contract and enter into agreements with agencies of the Federal Government, and with agencies of this State, other States, interstate agencies, and with other persons as necessary to carry out the purposes of this Act.

(d) To develop, propose, promulgate, and amend such rules and regulations as are necessary to carry out the purposes of this Act.

Section 4. *Prohibition of Discharges*

Except as in compliance with the provisions of this Act, and any rules and regulations promulgated hereunder, the discharge of any pollutant by any person shall be unlawful.[5]

Section 5. *Issuance of Permits*

The [Director] may, after public notice and opportunity for public hearing, issue a permit for the discharge of any pollutant or combination of pollutants into State waters, notwithstanding section 4 of this Act, upon condition that such discharge meets or will meet all applicable State and Federal water quality standards and

[3] A State need not exclude sewage from vessels or certain well injection from its definition of "pollutants" but such discharges are not required to be covered in the State's permit program for purposes of approval under sections 402(b) and (c) of the FWPCA. The bracketed term "the appropriate State agency" was used in this section instead of "Director" to draw attention to the possibility that the somewhat specialized determination required to be made in clause (B) may in some cases be made by an agency other than the agency or agencies primarily responsible for administration of the State's permit program.

[4] This definition is an all encompassing one that will insure coverage of the waters required to be included within the NPDES. A narrower scope of waters covered will be adequate as long as the "waters of the United States" (FWPCA Section 502(7)) are included and the State has provisions which authorize the issuance of permits to control the disposal of pollutants into wells (FWPCA Section 402(b) (1) (D); 40 CFR Section 124.80). "Water of the United States" includes:

(1) All navigable waters of the United States;
(2) Tributaries of navigable waters of the United States;
(3) Interstate waters;
(4) Intrastate lakes, rivers, and streams which are utilized by interstate travelers for recreational or other purposes;
(5) Intrastate lakes, rivers, and streams from which fish or shellfish are taken and sold in interstate commerce; and
(6) Intrastate lakes, rivers, and streams which are utilized for industrial purposes by industries in interstate commerce.

[5] It should be noted that because of the scope of the definitions of "discharge" and "State waters" that this prohibitory clause is broad enough to cover disposal of pollutants into wells (see FWPCA Section 402 (b) (1) (D), 40 CFR 124.80). The definition of "discharge" also has the effect of limiting the scope of this provision to "point source" discharges.

effluent limitations and all other requirements of this Act.[6]

Section 6. *Duration of Permits*

Each permit issued under this Act shall have a fixed term not to exceed five years. Upon expiration of a permit, a new permit may be issued by the Director, after review by the Director in accordance with such rules and regulations as he shall prescribe, after notice and opportunity for public hearing, and upon condition that the discharge meets or will meet all applicable State and Federal water quality standards effluent limitations and all other requirements of this Act.[7]

Section 7. *General Terms and Conditions of Permits*

(a) The [Director] is authorized to require as conditions in permits issued under this Act the achievement of:

(1) effluent limitations based upon the application of such levels of treatment technology and processes as are required under the Federal Water Pollution Control Act, as amended;

(2) any more stringent effluent limitations necessary to meet water quality criteria established pursuant to any State or Federal law or regulation.[8]

(b) Effluent limitations prescribed under subsection (a) of this section shall be achieved in the shortest reasonable period of time consistent with State law and the Federal Water Pollution Control Act, as amended, and any regulations or guidelines promulgated thereunder.

(c) The [Director] is further authorized to: (1) set and revise schedules of compliance and include such schedules within the terms and conditions of permits for the discharge of pollutants; and (2) prescribe terms and conditions for permits issued under this Act to assure compliance with applicable State and Federal effluent limitations and water quality criteria, including requirements concerning recording, reporting, monitoring, entry and inspection to the extent permissible under sections 13 and 14 of this Act, and such other requirements as are consistent with the purposes of this Act.

Section 8. *Prohibition Against Issuing Permit in Certain Instances*

No permit shall be issued authorizing any of the following discharges:

(a) The discharge of any radiological, chemical, or biological warfare agent or high-level radioactive waste;

(b) Any discharge which the Secretary of the Army, acting through the Chief of Engineers, finds would substantially impair anchorage and navigation of any waters of the United States;

(c) Any discharge to which the Administrator of the U.S. Environmental Protection Agency, or his designee, has objected pursuant to any right provided to the Administrator under the Federal Water Pollution Control Act, as amended.

(d) Any discharge which is in conflict with an areawide waste treatment management plan approved under the Federal Water Pollution Control Act, as amended.[9]

Section 9. *Permit Conditions Concerning Publicly Owned Treatment Works*

(a) The [Director] shall impose as conditions in permits for the discharge of pollutants from publicly owned treatment works requirements for information to be provided by the permittee concerning new introductions of pollutants or substantial changes in the volume or character of pollutants being introduced into such treatment works.

(b) The [Director] is authorized to impose as conditions in permits for the discharge of pollutants from publicly owned treatment works appropriate measures to establish and insure compliance by industrial users with any system of user charges required under State or Federal law or any regulations or guidelines promulgated thereunder.[10]

---

[6] By requiring compliance with "all applicable State *and* Federal water quality standards and effluent limitations" this provision requires compliance with whichever standard or limitation is the more stringent.

The Report of the House Committee on Public Works on the 1972 Amendments to the Federal Water Pollution Control Act (H.R. Rep. No. 92-911, 92nd Cong., 2d Sess.) states (at pages 125-126):

"The committee points out, as it did in the discussion of section 401, that the term 'applicable' used in section 402 has two meanings. It means that the requirement which the term 'applicable' refers to must be pertinent and apply to the activity and the requirement must be in existence by having been promulgated or implemented.")

[7] Inclusion of permits issued under this section within the definition of "permits" in section 2 has the effect of insuring that all provisions in this draft applicable to permits issued pursuant to section 5 are also applicable to renewal permits.

The Director may provide for procedural shortcuts such as abbreviated applications forms when reissuing permits. The FWPCA, however, makes no distinction between new and old permits, so a renewal permit must meet the same basic requirements as are applicable to "first round" permit issuances under section 402.

[8] Federal effluent standards are made applicable to all point sources subject to permit under section 5, *supra* and the definitions of "water quality standards" and "effluent limitations" set forth under Section 2. However, until Federal effluent guidelines for point sources are promulgated under the FWPCA, the "best practicable", "best available" and "secondary treatment" technology requirements must necessarily be applied on a case by case basis in issued permits, and State will need authority to do so. States also will need this authority to supplement any gap in the coverage of all point sources in issued Federal regulations or guidelines, particularly in the near term.

[9] This section is intended to prohibit the issuance of permits with respect to those discharges which may not be permitted under the FWPCA (see Sections 301(f), 402 (b) (6), 402 (d) (2) and 208(e)). The requirements for approval of State programs under Section 402 also might be satisfied by promulgation of State regulations precluding issuance of permits in these circumstances as long as the State Director clearly has authority under State law to deny permits in such circumstances (even though the proposed discharge might otherwise meet the applicable effluent limitations and water quality standards). Supporting statutory authority might be as follows:

"The Director may refuse to issue a permit for the discharge of pollutants when he finds that issuance of the permit would violate the provisions of any Federal law or rule or regulation promulgated thereunder."

[10] Subsection (b) of this section is included in order to satisfy section 402 (b) (9) of the FWPCA which requires States to have the authority to insure that industrial users will comply with, *inter alia*, section 204(b) of the Act concerning user charges. Three basic methods of insuring compliance with a system of user charges appear to be available: (a) issue permits directly to industrial users; (b) insert conditions in the permit running

Copyright © 1973 by The Bureau of National Affairs, Inc.

Section 10. *Pretreatment Standards*

The [Director] is authorized to apply, and to enforce pursuant to sections 18 through 21 of this Act, against industrial users of publicly owned treatment works, toxic effluent standards and pretreatment standards for the introduction into such treatment works of pollutants which interfere with, pass through, or otherwise are incompatible with such treatment works. The [Director] may promulgate such rules and regulations as are necessary to implement this section.

Section 11. *Public Notice*

The [Director] shall promulgate rules and regulations and perform all acts as may be required under State or Federal law, rules and regulations to insure adequate public notice and public participation concerning permit applications and actions related thereto.

Section 12. *Public Hearings*

The [Director] shall provide an opportunity for public hearing, with notice thereof, with respect to all permit applications in accordance with applicable provisions of State and Federal law, rules and regulations. The [Director] shall promulgate such rules and regulations as are necessary to implement this section.

Section 13. *Monitoring, Recording, and Reporting*

The [Director] may, by regulation, order, permit, or otherwise require the owner or operator of any source of a discharge of pollutants or of any source which is an industrial user of a publicly owned treatment works to:

(a) establish and maintain such records;

(b) make such reports;

(c) install, calibrate, use and maintain such monitoring equipment or methods (including where appropriate, biological monitoring methods);

(d) sample such discharges (in accordance with such methods, at such locations, at such intervals, and in such manner as the [Director] shall prescribe); and

(e) provide such other information relating to discharges of pollutants into State waters or to introductions of pollutants into publicly owned treatment works as the [Director] may reasonably require.

Section 14. *Inspection and Entry*

(a) To carry out the purposes of this Act or any rule, regulation, order, or permit issued thereunder, the [Director] or his authorized representative, upon presentation of his credentials:

(1) shall have a right to entry to, upon, or through any premises in which any effluent source is located or in which any records are required to be maintained;

(2) may at reasonable times have access to and copy any records required to be maintained;

(3) may inspect any monitoring equipment or method which is required; and

(4) may have access to and sample any discharges or pollutants to State waters or to publicly owned treatment works resulting directly or indirectly from activities or operations of the owner or operator of the premises in which the effluent source is located.

(b) For the purposes of this section the term "effluent source" shall mean (1) a point source of the discharge of pollutants or (2) a source of introduction of pollutants into publicly owned treatment works by an industrial user.

Section 15. *Public Access to Information*

Any records, reports, or information obtained under sections 13 and 14 of this Act and any permits, permit applications, and related documentation shall be available to the public for inspection and copying; *provided* that upon a showing satisfactory to the [Director] by any person that such records, reports, permits, permit applications, documentation, or information, or any part thereof (other than effluent data) would, if made public, divulge methods or processes entitled to protection as trade secrets of such person, the [Director] shall consider, treat, and protect such record, report, or information, or part thereof, as confidential, *provided further, however,* that any such record, report, or information accorded confidential treatment may be disclosed or transmitted to other officers, employees, or authorized representatives of this State or of the United States concerned with carrying out this Act or when relevant in any proceeding under this Act.

Section 16. *Revocation, Modification, or Suspension of Permits*

Any permit issued under this Act may be revoked, modified or suspended in whole or in part during its term for cause, including but not limited to the following:

(a) violation of any condition of the permit,

---

between the State and municipality; and (c) provide for direct enforcement of the user charge requirements against industrial users. This draft utilizes the second two of these general approaches.

Section (b) above insures that a system of user charges will in fact be established where required under section 204(b) and give the State the power to insert such conditions in the municipal permit as are necessary and feasible to insure compliance by industrial users with such a system. Permit conditions might include (a) a condition requiring the permittee to "cut-off" a non-complying user, (b) detailed conditions which, in effect, set up the user charge system, or (c) possibly a requirement that contracts be entered into with users with a right of contract approval residing in the State or a provision that the State be made a third party beneficiary, or both.

Section 22 of this draft also gives the State the right to enforce user charge requirements directly against industrial users through injunctions and compliance orders.

Violation of compliance orders would give rise to civil penalties or could be enforced through injunctive actions. Injunctive relief could also be sought (without compliance orders) to simply order the user to comply with the user charge system or even forbid the discharger from using the municipal plant (this would amount to a shut down of the industrial plant).

Other means of insuring compliance with Section 204(b) of the FWPCA may be available to the State (such as criminal sanctions or contract actions), and the methods utilized herein are intended to be suggestive of some of the approaches which could be taken.

The balance of section 402 (b) (9) is satisfied by inclusion of provisions in the enforcement provisions, *infra*, giving the State the power to enforce pretreatment requirements, toxic effluent standards and reporting monitoring, entry and inspection requirements directly against industrial users (see sections 10, 13, 14 and 17 through 21). In addition, these same matters may be included as conditions in the municipal permit under the provisions of section 7, *supra*.

(b) obtaining a permit by misrepresentation or failure to disclose fully all relevant facts; or

(c) change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.[11]

Section 17. *Emergency Powers*

Notwithstanding any other provision of this Act, the (Director) upon receipt of evidence that a pollution source or combination of sources, including an industrial user of a publicly owned treatment plant, is presenting an imminent and substantial endangerment to the health of persons, or to the welfare of persons where such endangerment is to the livelihood of such persons, such as inability to market shellfish, may bring suit on behalf of the State in the appropriate court to immediately restrain any person causing or contributing to the alleged pollution to stop the discharge or introduction of pollutants causing or contributing to such pollution or to take such other action as may be necessary.[12]

Section 18. *Compliance Orders*

Whenever, on the basis of any information available to him, the [Director] finds that any person is in violation of any provision of this Act or of any rule, regulation, water quality standards, effluent limitations, or permit under this Act, [he] may issue an order (1) specifying the provision or provisions of this Act, or the rule regulation, water quality standard, effluent limitation, or permit alleged to be violated or about to be violated and the facts alleged to constitute a violation thereof and (2) prescribing the necessary corrective action to be taken.

Section 19. *Injunctive Relief*

The [Director] is authorized to commence a civil action for appropriate relief, including a permanent or temporary injunction, for any violation or threatened violation for which the [Director] is authorized to issue a compliance order under section 18 of this Act. Such action shall be brought in the Court [add venue provision] and such Court shall have jurisdiction to restrain such violation and to require compliance.[13]

Section 20. *Civil Penalties*

Any person who violates any provision of this Act, or of any permit, rule, regulation, standard or order issued or promulgated hereunder, shall be subject to a civil penalty not to exceed $10,000 per day of such violation.[14]

Section 21. *Criminal Penalties*

(a) Any person who willfully or negligently (1) discharges pollutants in violation of section 4 of this Act or in violation of any condition or limitation included in a permit issued under section 5 or section 6 of this Act, or (2) violates requirements of sections 13 and 14 of this Act; or (3) with respect to introductions of pollutants into publicly owned treatment works violates a pretreatment standard or toxic effluent standard, shall be punished by a fine of not less than $2,500 nor more than $25,000 per day of violation. If the conviction is for a violation committed after a first conviction of such person under this subsection, punishment shall be by a fine of not more than $50,000 per day of violation.

(b) Any person who knowingly makes any false statement, representation, or certification in any application, record, report plan, or other document filed or required to be maintained under this Act, or by any permit, rule,

---

[11] No provision is made in this section of the draft or in those enforcement provisions which follow for hearings or the means of administrative and judicial review. States may vary in their approaches to these matters and this draft does not attempt to pick one or another method of insuring adequate enforcement provisions which also provide due process to the discharger. Each of the basic substantive powers covered in the enforcement provisions of the draft should, however, be available to State Directors to insure approval of permit programs under section 402.

[12] This section provides an optional means of complying with the requirement of 40 CFR Section 124.73(b) that the State either have a procedure enabling the immediate and effective halting or elimination of imminent and substantial endangerments to the health or welfare of persons by (1) order or suit or (2) by telephonic notice to the EPA Regional Administrator. The provisions above is patterned after section 504 of the FWPCA. It should be noted that, in addition to the requirement set forth in 40 CFR Section 124.73(b), section 106 (e) (2) of the FWPCA requires that states have authority comparable to section 504 of the Act in order to qualify for program grants beginning in fiscal year 1974. The provision might be strengthened by eliminating the requirement (which could be inferred from the language above) that a showing of "pollution" rather than merely a "discharge" is a prerequisite to obtaining injunctive relief. Also, the requirement that "an imminent and substantial" endangerment be shown could be eased.

[13] Possible additional provisions which might be desirable but do not appear to be required to satisfy the minimum requirements of the FWPCA are:

(a) Clear authority to issue temporary restraining orders *ex parte*;

(b) Removal of any necessity for the posting of a bond or undertaking by the Director prior to obtaining relief;

(c) Removal of any requirement to establish irreparable harm or the inadequacy of remedies at law; and

(d) Authority for the Court to require the posting of sufficient performance bond or other security to assure the correction of the violation within the time prescribed.

[14] Section 402(b) of the FWPCA requires that the State have the authority "to abate violations of the permit or the permit program, including civil and criminal penalties and other ways and means of enforcement." 40 CFR Section 124.73 (h) provides that:

"The maximum civil penalties and criminal fines recoverable by the Director pursuant to paragraphs (e) and (f) of this section shall (a) be comparable to similar maximum amounts recoverable by the Regional Administrator under section 309 or (2) represent an actual and substantial economic deterrent to the actions for which they are assessed or levied."

Thus, although the penalties in State statutes need not be exactly the same as those established under section 309 of the FWPCA, they must represent an "actual and substantial economic deterrent."

Additional statutory provisions which could augment the civil penalties which correspond to the Federal law are:

(a) Procedures for assessment by the Director or by a State court against any violator of the costs of an investigation, inspection, or monitoring survey which led to the establishment of the violation;

(b) Procedures which enable the Director to assess against or to sue any person responsible for an unauthorized discharge of pollutants for any expenses incurred by the State in removing, correcting, or terminating any adverse effects upon water quality resulting from such unauthorized discharge of pollutants, whether or not accidental; and

(c) Procedures which enable the Director to sue for compensation for any loss or destruction to wildlife, fish or aquatic life, and for any other actual damages caused by an unauthorized discharge of pollutants, either for the State, for any residents of the State who are directly aggrieved by the unauthorized discharge of pollutants, or both.

Copyright © 1973 by The Bureau of National Affairs, Inc.

regulation or order issued under this Act,-or who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Act or by any permit, rule, regulation, or order issued under this Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than six months, or by both.

Section 22. *State Enforcement of Certain Requirements Applicable to Persons Introducing Pollutants Into Publicly Owned Treatment Works*

(a) In the event any condition of a permit for discharges from a publicly owned treatment works is violated, the Director may proceed pursuant to section 18 or 19 of this Act to restrict or prohibit the introduction of any pollutant into such treatment works by a source not utilizing such treatment works prior to the finding that such condition was violated.[15]

(b) If the Director finds on the basis of information available to him that an industrial user is not in compliance with a system of user charges required under State or Federal law, or the condition of any permit issued by the Director to the publicly owned treatment works into which such user is introducing pollutants, the Director may proceed to enforce or apply such system of charges directly against such industrial user pursuant to sections 18 and 19 of this Act.

[15] Section 402 (h) of the FWPCA gives the State the power to seek injunctive relief "in a court of competent jurisdiction" to prohibit or restrict new introductions into a treatment plant in violation of a State permit. Section 22 (a) above is included to give the State clear authority, under State law, to seek such relief in State court.

Section 23. *Board Membership*

Notwithstanding any contrary provision of State law, no board or body of this State which approves permit applications or portions thereof shall include, as a member, any person who receives, or has during the previous two years received, a significant portion of his income directly or indirectly from permit holders or applicants for a permit.[16]

Section 24. *Water Quality Planning*

The [Director]is authorized to establish and conduct a continuing planning process consistent with the requirements of the Federal Water Pollution Control Act, as amended, including but not limited to the establishment and application of maximum daily loads of pollutants.[17]

Section 25.

All laws or portions thereof in conflict with this Act are hereby repealed to the extent of any such conflict.

[16] This provision is based upon the conflict of interest clause contained in section 304 (h) (2) (D) of the FWPCA. Although no statutory requirement for a particular kind of State board or administrative scheme is contained in the FWPCA, other than the conflict of interest provision, the above section is included in order to insure that any provision of State law which would mandate a representation upon a State board violative of section 304 (h) (2) (D) would not stand in the way of approval of State's program under section 402.

[17] This section is included in order to insure adequate authority to conduct a continuing planning process required under section 303 of the FWPCA as a prerequisite to approval of a State's permit program. Although the Director is given this authority above, the State agency responsible for planning might be an agency other than the one responsible for the administration of the State's permit program.

Mr. SMITH. On page 6 you make the statement that there is no doubt that the designation of uses by State politics and legislative fiat was often based on a wish, rather than a reasonable or achieveable environmental program.

Can you give me some illustrations of that, Mr. Goulding?

Mr. GOULDING. Well, we have had cases in Georgia where the State was on the book to designate rules, and then found later that additional studies indicated it was not necessarily true that the rule was needed. It was in fact true that that use designation, could not be achieved. This was because nonpoint sources in other areas, or other sources prevented the realization of the stream use.

Mr. SMITH. Again, I would be happy if you want to respond in some further detail.

Mr. BORY. One example that comes to mind, is the Peace River in Florida. The use standards included very strict regulations on municipal and industrial treatment relating to phospherous, and yet this is one of the largest natural sources of phosphates in the country. The reduction by treatment plants to one part of phospherous per million, made very little impact on the total phospherous content of the river. Yet it was required by the original EPA and State standards.

Our point here is that where an adjustment appears to be necessary, based on actual instream sampling, the State should be permitted to make the adjustment. The original use standards designated early in the program, before there was any significant sampling data, and before actual results from the treatment plants coming on line, should be reviewable by the States and the States should be permitted to make appropriate adjustments. It is similar to the issue that was raised by the previous witness.

Mr. GOULDING. I know that nonpoint discharges have a terrific impact. NPS does not allow us to meet some of these use standards.

Mr. SMITH. We heard some discussion that we ought to move from a construction grant program to a loan program. Do you wish to comment on that?

Mr. GOULDING. I think we referred to the symposium that was held here in Washington a year ago, and I think this is something that was brought out then. A loan program with reasonable interest could provide ongoing funds that many communities would take advantage of.

I think we would basically support that type of program. Although there are some cities that still prefer to have the grant program, we feel again, as we testified, unless we have a consistent program, many communities will just stop their efforts if the funding is cut off.

Mr. SMITH. I would assume, and you could comment on this, that a grant program would likely give you more flexibility in the State of Georgia, than a loan program, which might put you in some sort of jeopardy, as far as extending the loan, or the loan payoff, et cetera.

Do you agree with that, or not?

Mr. BORY. This is a tradeoff that we really have not addressed. We feel that when Congress chose in 1981 to extend the authorization for a 4-year period, that that was part—what we testified to at

the time—of the consistency and predictability of a long-term program.

The loan program may, in fact, after 1985, be an ingredient that is appropriate or desirable, as opposed to an extension of the grant program. ACEC has really not looked at this in any detail, and has not at this time, an official position on a loan program.

Mr. GOULDING. I think there may have been some effort to say that the grant program itself would come to an end, and again a loan program would certainly be something attractive to the communities to take advantage of.

Many States, as you know, are creating their own grant and loan provisions, to try to offset the reduction of Federal funding.

Mr. SMITH. Yes, I think we are talking more about a substitution of the program,

Mr. GOULDING. Right.

Mr. SMITH. If you have any further thoughts on that, I would like to hear them.

I think it is an issue that I would like to hear a policy statement, if you are prepared to do that, because I think it gets to the question of the States continually seeking flexibility under a grant program, and I believe that a loan program could be so structured as to have greater control over what happens in the State of Georgia, for instance.

Mr. GOULDING. Right.

Mr. SMITH. That is all I have.

Mr. ROE. Are there further questions?

Mr. Goulding, we want to thank you and Mr. Bory for your valuable testimony. We appreciate your being here this morning.

Our next witness is Mr. Charles Coward of the Eagle Dyeing and Finishing Co., Mount Holly, N.J.

Mr. Coward.

Mr. Coward, we want to welcome you to our committee, and particularly the fact that you are from the great State of New Jersey.

TESTIMONY OF CHARLES W. COWARD, VICE PRESIDENT, EAGLE DYEING & FINISHING CO., MOUNT HOLLY, N.J.

Mr. COWARD. Mr. Chairman, I appreciate the opportunity to appear before you and the members, and I will make this—by reading my presentation, reading from the paper that I presume has been distributed to your committee members.

The writer is appearing before your body today to present to your members a serious problem we find our company confronted with, that, if not corrected soon, could force us to discontinue our business. Ours was started in the year 1939 as a service organization to dye and finish furniture upholstery fabrics and also yarns for the weaving trade. Since then there have been many changes in the textile field with the larger producers expanding their operations to provide them with facilities to process yarns, weaving of fabrics and dyeing and finishing of same.

Our source for business now and for several years has been the smaller weaving plants located within a reasonable transportation distance of ours.

Our processing waste water has been discharged to Mount Holly Sewerage Disposal Plant for more than 30 years, during which time we have been cooperating with each other to assure a good relationship.

The plans for redevelopment and modernizing of the Mount Holly Sewerage Disposal Plant were started in the year 1972 and, in the final design, provided for an industrial waste division for their plant expansion program. Unfortunately, two sources for industrial income have failed and closed; the Ankocas Dyeing & Finishing Co., and the Northampton Textile Co., and a third, the Arrow Safety Devices Co., has moved most of its production to the South.

As of January 1, 1983, the Mount Holly Sewerage Authority increased our costs for their services by three times their previous charges, during which time our business volume has decreased due to economic conditions affecting the textile field.

Prior to start up of the new plant we were charged a flat rate for our industrial waste sewerage service and, when we appealed to the Mount Holly Sewerage Authority for some relief from what we considered excessive new charges, were advised we would have to continue to pay the same rate of $1.62 per thousand gallons charged a residential user.

Our invoices from the Mount Holly Sewerage Authority for the first 9 months of this year have totaled $89,280, and using the same charge basis for the final 3 months of this year would be considerably above $100,000.

We are operating in a very competitive field and to add this tremendous increase to our overhead is just too much to accept. We fully realize the modernization of the Mount Holly Sewerage Plant has increased operating and maintenance costs, but they can be prorated based on a large volume user versus the very small residential. We expect to pay our proportionate share of operating and maintenance costs, but when our cost for service for the months of April were $10,213, for May $11,362, and for June $12,450, when the average residential cost per quarter—3 months—would be $50 to $60, there must be something wrong with the formula developed by the Environmental Protection Agency Clean Water Act. The operating, maintenance, and production costs are usually always lower when a large volume is made available to the producer.

Our little business is in a precarious position. We have been desperately trying to continue operations to assure the employment of 60 people, some of whom have been with us for over 30 years. Mount Holly will feel this unemployment load greatly after the closing of other plants and the sewerage authority will lose an important source of income. Taxes of many kinds will be lost.

Unfortunately, for the Mount Holly Sewerage Authority the new expansion project, completed in 1982, more than doubled the capacity of the old plant. The building expansion that was expected has not materialized for residential, commercial, and industrial users. With the loss of the industrial accounts, previously mentioned, Eagle has become the main source of industrial income for the new plant, and we should not be and we cannot be asked to carry this financial load until some other plants are available, which could be

20-955 O—84——88

several years. Many of the textile plants have moved to the southern rates where costs of building and operating are lower.

Your prompt consideration will be greatly appreciated.

We have no question with EPA regulations. We cooperated with the regional office in New York City, which has now turned the responsibility over to Trenton, N.J. We have no concern about what they have asked us to do, and we have tried to cooperate.

We are greatly concerned about the cost of our waste-water treatment the Mount Holly Sewerage Authority is charging us now. The fact that they may say to us, "we cannot make a change in this until we get some new industrial plants in Mount Holly," we are concerned about what that could mean, and we just cannot wait that long and survive.

Mr. ROE. And you have taken up with the Mount Holly people?

Mr. COWARD. We have had several meetings. I attended the hearing in January, when they announced these changes to the township. We have had them down to our office, and they have said that they cannot move on this because of the regulation prepared by the Federal EPA. They have a Federal grant and I believe the grant is over $7 million, to help them pay for this project and they cannot move until or unless that particular part of it is changed, because they have to meet the Federal regulations.

Mr. ROE. Would you—we understand what the problem is. And you have the Mount Holly people, sewer people respond to you in writing, and lay out, because of section such and such of the law, there is nothing we can do about it, unless the law is changed?

Mr. COWARD. Mr. Chairman, we have asked them, and they have written us, merely confirming what they told us, that they had to meet the EPA regulation.

Mr. ROE. But there is such a document?

Mr. COWARD. Pardon?

Mr. ROE. There is such a document. You have such a letter?

Mr. COWARD. We have it at the office, where they told us they could not move otherwise.

Mr. ROE. All right. Would you be kind enough to provide the committee with a copy of that letter, that we can attach to your testimony?

Mr. COWARD. I would be delighted.

Mr. ROE. Because they are in effect coming back and saying we are not quarreling with you as a business, yet they are coming back and saying we are precluded because of the law, or at least as the regulations are interpreted, in making any change, without some change in the law, is that basically what they are saying?

Mr. COWARD. I understand, and I will be glad to furnish you with that correspondence. And as I mentioned, we have been trying our best to keep that little plant operating. Something like this, probably to the big companies would not mean very much but to us, it does. And we have had our employees coming in and appealing to us to assure them that their jobs are secure, and it hurts to have to tell them, "well, we are in a precarious position."

So I shall be glad to get this letter from the sewerage authority, and send it to you.

Mr. ROE. Yes.

[See letter, p. 1382.]

Mr. ROE. Let me ask you this. Could you also give us, if it would not be too much work, a 10-year rundown, as to what was your sewer charges originally before you got into this situation?

Mr. COWARD. They previously had merely given us a flat rate.

Mr. ROE. Yes; that is what I mean.

Mr. COWARD. And that has been in existence for some time.

Mr. ROE. How much was that, do you recall?

Mr. COWARD. It was about $3,000 a month.

Mr. ROE. $3,000 a month?

Mr. COWARD. Yes; 2,940.

Mr. ROE. So it has tripled now?

Mr. COWARD. Yes.

Mr. ROE. Could you give us figures as to what our average rate was, to such and such a date, now the rate is so much, so that we can see that the relationship is say $30,000 a year, versus 62, whatever the case may be?

It would be more than that, it would be $100,000 a year.

Mr. COWARD. I can furnish you with copies of bills, to show what has been going on over the period of 2 or 3 years in fact.

Mr. ROE. We would appreciate that.

Mr. COWARD. I would be glad to do that.

[The following was received for the record.]

EAGLE DYEING & FINISHING CO.
MOUNT HOLLY, N. J.
08060

November 16, 1983

Congressman Robert Roe
Subcommittee on Investigations
and Oversight
B376 RHOB
Washington, D. C. 20515

Subject: Additional information requested for use in the writer's presentation of Tuesday, November 1, 1983 before your Sub-committee on Water Resources

Dear Congressman Roe:

In compliance with your request I am enclosing copies of invoices of Mount Holly Sewerage Authority for the years 1972 to 1982 when charges from the Mount Holly Sewerage Authority were on a flat rate basis.

Also enclosed is a letter from the Mount Holly Sewerage Authority covering invoices rendered for their services for each month from January 1983 to and including October 1983 when the flat rate procedure was changed to invoice us on a gallonage basis using the rate charged to residential users. This was confirmed in their letter of November 8, 1983, which we are enclosing.

In my presentation before you and your committee I advised you the cost for the Mount Holly Sewerage Authority services charged would be more than three (3) times previous charges. You will note from the accompanying letter our bills from the Authority total $100,309.10 and probably will exceed $20,000.00 for November and December.

The flat rate billing from the Authority, as you will observe from the enclosed invoices total $35,280.00 for the year 1982. The flat rate of $2,940.00 per month was used for the years 1980, 81 and 82.

The years 1972 thru 1979 the rate was $2,500.00 per month and prior to that $1,700.00.

We appreciate greatly your interest in our problem and hope you are successful in helping us.

Very truly yours,

EAGLE DYEING & FINISHING COMPANY

Charles W. Coward

Charles W. Coward

Lippincott Lane
Mt. Holly, New Jersey 08060

Attention: Mr. Batten

Re: 1983 Billings

Dear Mr. Batten:

The following is list of the monthly billing for 1983 minus any interest charges incurred:

January, 1983 (5,338,000 Gals)	$ 8,723.16
February, 1983 (4,846,000 Gals)	7,926.12
March, 1983 (6,042,000 Gals)	9,963.64
April, 1983 (6,258,000 Gals)	10,213.56
May, 1983 (6,967,000 Gals)	11,362.14
June, 1983 (7,639,000 Gals)	12,450.78
July, 1983 (3,264,000 Gals)	5,363.28
August, 1983 (7,526,500 Gals)	12,267.72

September, 1983 (6,817,000 Gals)	11,119.14
October, 1983 (6,693,800 Gals)	10,919.56
	100,309.10

As per our telephone conversation, as of January, 1983 we have been billing you for the gallonage that has been coming in our facility for your company. Until that time we have only been able to estimate the flow. The rate being charged this year is the same as the gallonage rate charged to all of our Mount Holly customers as mandated under Federal E.P.A. Regulations. This rate is $1.62 per 1,000 gallons, 92% of which is for O/M costs.

If there are any further questions, please feel free to call our office.

Sincerely,

William G. Dunn
Executive Director

Mr. ROE. All right. Is there any further questions by the members?

No further questions.

Thank you very much, Mr. Coward. We will look forward to that.

Mr. COWARD. I appreciate the opportunity to be here.

Mr. ROE. I appreciate your being here, and please give us the added information.

We now have with us as our next witness, representing the National Utility Contractors Association, Mr. Leon Asadoorian, President of the Methuen Construction Co.; and Mr. Robert Briant, executive director, Utility Contractors Association of New Jersey.

We want to welcome you gentlemen back to the committee again, and appreciate all the help you have been to us over the past, and I note that you have with you—I thought that bag was going to contain your testimony.

You have submitted two methods of information, presentation of information—really, one is your written report—and then you have digested that into your oral report.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

NATIONAL UTILITY CONTRACTORS ASSOCIATION
(NUCA)

Represented by

Leon Asadoorian, President
Methuen Construction Company
Methuen, Massachusetts

and

Robert Briant, Executive Director
Utility Contractors Association of New Jersey
Edison, New Jersey

WATER POLLUTION CONTROL ACT AMENDMENTS

Subcommittee on Water Resources
Honorable Robert Roe, Chairman

November 1, 1983
Washington, D.C.

National Utility Contractors Association
(NUCA)

SUMMARY
of Recommendations

1.) Reauthorize the Clean Water Act, including Title II (EPA Construction Grants Program) through 1988.

2.) Retain Collectors, Combined Sewer Overflow (CSO) correction as separate categories eligible for federal funding.

3.) Increase federal funding for Title II above the current $2.4 billion authorization.

4.) Amend Title II to permit States to use their EPA construction grants as loans, should they so desire.

5.) Dedicate the limited federal funds available toward the correction of identifiable point sources of of pollution, not non-point sources.

Mr. Chairman and members of the committee, I am Leon Asadoorian, President of the Methuen Construction Company of Methuen, Massachusetts. Joining me is Robert Briant, Executive Director of the Utility Contractors Association of New Jersey. Together we are representing the National Utility Contractors Association, or NUCA.

Our national association is comprised of some 2,000 companies nationwide -- contractors, suppliers, and manufacturers -- that specialize in water delivery and wastewater treatment construction projects, particularly underground pipeline work. Our members lay the pipe and build the treatment plants necessary to achieve the goals set forth by Congress in the Federal Water Pollution Control Act.

Public education campaigns conducted by NUCA and other groups have been successful in one important respect: many people are beginning to realize the decaying condition of our water delivery and wastewater treatment systems, and our highways and bridges. The even more crucial problem, however, has not been adequately addressed: how does the nation pay to repair and rehabilitate this network of public services?

As a result of our association's members' work in building many of the wastewater treatment facilities funded as a result of the federal statute now before this committee, we wish to take this opportunity to offer the utility construction industry's views on the program and to offer our recommendations on possible improvements to the Act.

Mr. Chairman and members of the committee, in light of your time limitations, I wish to submit for the public record a copy of our complete testimony at this time and then briefly summarize it for you. We will then be happy to answer any questions you may have.

Mr. Chairman, members of the utility construction industry strongly feel a partial, but important, answer to the question of how to alleviate the nation's water pollution problem is provided in Section 3 of Committee Chairman Howard's proposal, H.R. 3282. In short, that provision reauthorizes the EPA Construction Grants program through fiscal 1988.

Reauthorization

Legislation adopted in 1981, through the tireless efforts of Chairman Roe and this subcommittee, extended the sewage treatment construction program only through fiscal 1985. President Reagan has indicated his desire to then fund the program through "block" grants to the states.

In our opinion, this approach would deal a serious setback to this nation's clean water effort. Under the block grant approach, state and local officials would have discretion in deciding which of a wide array of programs would receive funding. Unfortunately, funding for sewer pipelines and treatment plants is not politically popular. It has been our experience that, unless funding is specifically earmarked, many local government officials are extremely hesitant to dedicate funding for sewage treatment projects. Therefore, we feel a continuation of the federal program is essential to meet the goals of the Clean Water Act.

Collectors, Rehabilitation, CSOs

In addition to reauthorizing the Construction Grants program, another recommendation the utility construction industry feels is crucial to the future of the nation's clean water effort is the critical need for Congress to retain in its reauthorization legislation certain categories currently eligible for federal funding that are scheduled for inclusion in a "set-aside" category in fiscal 1985.

Specifically, we urge you to ensure that sewer rehabilitation, combined sewer overflow (CSO) correction and sewe lection systems remain as separate categories eligible for federal funding. Under the 1981 amendments, these categories are scheduled for inclusion in each Governor's 20 percent set-aside fund beginning in fiscal 1985.

In many regions of the nation, the major problem in meeting local water pollution needs lies not in treatment plant construction, but in upgrading their sewage collection systems. I have with me a section of collector pipe recently replaced in the Boston, Massachusetts area. As you can see, corrosion and the accumulation of sediment over many decades of use have severely hampered the usefulness of this pipeline. Unfortunately, the condition of this pipe often represents the norm rather that the exception in many areas. Many of these pipelines have been in use for nearly a century. They are cracked, broken and corroded beyond repair. EPA estimates that leakage into these pipes constitutes 25 percent of the total existing flow to the nation's treatment plants. As a result, we contend that sound collector sewer systems would result in the need for lower capacity -- and less costly -- treatment plants.

Mr. Chairman, wastewater treatment systems are just that: systems. The efficiency of a system is dependent upon each of its parts. Sound collector pipelines alone are inadequate if the treatment plant is obsolete and, conversely, a treatment plant -- regardless of its degree of high technology -- does little good if the pipelines carrying wastewater to it are aged, leaking and corroded.

Significantly, a National League of Cities survey finds that 50 percent of 1,400 participating city governments said their wastewater collection systems need major repair. Smaller communities in particular, where collector pipeline construction constitutes nearly 80 percent of total project cost, would be particularly hard hit if collector funding is reduced.

In short, the utility construction industry feels collection systems, in particular, as well as rehabilitation and combined sewer overflow correction, must remain as separate categories eligible for federal funding. While they would remain eligible when lumped together under each governor's discretionary fund, shifting them to a set-aside program would in our opinion, a.) send a signal to State and local officials that these categories are of less importance and b.) as a result, lead to reduced funding for them. Without adequate funding for collector systems and other pipe-related needs, this nation's war on water pollution is being waged with a half-empty arsenal.

Funding

Mr. Chairman and members of the Subcommittee, in addition to reauthorizing the program and retaining certain separate

categories, NUCA strongly supports increased yearly authorizations to fund it. I want to say at the outset that yes, as utility contractors we hope our industry would benefit from this increased funding through the competitive bidding system. But it is evident that the current $2.4 billion yearly appropriation is simply inadequate to meet current or projected needs.

As a result of massive underinvestment in properly maintaining existing systems, and in projecting future needs, the EPA estimates $118 billion will be needed by the year 2000 to comply with federal water quality requirements. While we are aware of the somewhat inflated projections contained in the EPA survey, other studies and statistics leave little doubt the financial requirements are immense.

Perhaps the most significant statistic is the survey indicating that nearly one-half of the nation's communities are unable to add additional homes or businesses onto their sewage treatment systems because they are already operating at full capacity. Simply stated, these basic public facilities are essential to the future economic growth of our nation.

Our industry feels the current $2.4 billion annual appropriation represents a "penny wise and pound foolish" approach to the Construction Grants program. A reduction in funding to the $2.4 billion dollar figure did not reduce the overall cost of our clean water needs. If anything, construction delays resulting from decreased funding have added to the total cost of the program when you consider that construction costs in the U.S. rose 65 percent between 1976 and 1983.

We compare the $2.4 billion annual figure to running in place -- we are barely keeping up with current funding needs without making a real dent in our overall needs.

And let there be no doubt that the utility construction industry has adequate capacity to more than handle the increased construction additional funding would entail. Unemployment within our industry presently hovers at the 30 percent mark. Hundreds of businesses have closed their doors as a result of declining wastewater treatment construction. Engineering and manufacturing interests have also suffered severely.

After initial delays in obligating appropriated funding due to the regulatory changes required by the '81 amendments, the EPA Office of Water, under the able administration of Henry Longest, is doing a good job in expediting the obligation of grants to municipalities. As of October 1 of this year, only $1.2 billion remained in fiscal 1983 appropriations. I think you will agree, Mr. Chairman, that this figure is substantially lower than corresponding unobligated monies from previous years and is an indication that additional funding is needed for the program.

State Loan Programs

In addition to increased funding, however, we of NUCA feel the statute before you should be amended to permit states to use all or part of their share of EPA construction grants as loans. My own State of New Jersey has been in the forefront of this concept with its "Infrastructure Bank" proposal, which is now being considered by the State legislature.

In short, the New Jersey proposal would operate as follows: capital funds (federal, state and private) would be deposited in special state loan accounts to be awarded as no- or low-interest loans to eligible communities for the construction or repair of roads, bridges, water and wastewater treatment systems. Loan repayments would represent a source of capital for additional loans.

State officials estimate many more sewage treatment projects could be built through this type of loan program than through a strictly-grant program. Once a federal EPA grant is used for a particular project, that money is obviously no longer available for other projects because the grant is not repaid.

The bottom line is this: under the current grant program, only a small handful of communities will receive funding while the remainder must finance projects on their own or, more likely, postpone construction in hopes of receiving a federal grant at some distant future date.

One potential problem we see in the New Jersey plan is that while initial EPA grant money would be required to be loaned for wastewater treatment projects, it fails to dedicate repaid sewage treatment loan monies for that purpose. In short, we feel Congress should permit States to use their EPA grants in a loan program, but language should be included requiring that those sewage treatment loan repayments be dedicated for additional sewage treatment projects.

We stress that this proposal would in no way <u>require</u> States to use their EPA grants as loans. It would merely <u>permit</u> interested States to use all, part or none of their grant money as loans for wastewater treatment construction projects.

There is no doubt this practice will result in increased user fees paid by businesses and households -- not to the degree, however, some opponents to the plan claim.

Mr. Chairman, the people of this nation have grown accustomed to paying artificially low user fees for sewage disposal services. Nationwide, a survey of 66 cities shows that the average family pays less than 50 cents per day for the collection and treatment of their wastewater. These low rates are largely responsible for the decaying condition of many systems. Wastewater collection, treatment and disposal is a vital, yet costly service, and the American consumer must realize the true cost of that service.

Non-Point Sources

Lastly, a number of proposals are being considered to control non-point sources of water pollution. We suggest, as have other witnesses before us, that insufficient data currently exists as to the technology and cost involved in correcting the non-point source problem. We feel that until further research has been conducted in this area, Congress should concentrate on earmarking its limited funds on correcting identifiable and correctable problems; namely, point sources of water pollution.

Mr. Chairman, in closing we wish to reiterate our wholehearted support for the reauthorization of the construction grants program at increased funding levels through fiscal 1988. In order to further increase the effectiveness of this vital program, however, we again urge you to amend the Act to permit states to use their grant allotments as loans for wastewater treatment projects. In addition,

the continued eligibility of collection, rehabilitation and combined sewer overflow projects for federal funding is imperative to the success of the clean water effort.

This nation has made significant progress in its effort to clean our waters, yet the job is only partially complete. To those who may be critical of the costs involved and their impact on the federal budget, we offer this analysis: a reduction in the federal budget is dependent upon economic growth, and economic expansion is dependent upon a sound infrastructure.

Thank you for giving us the opportunity to appear today, and we will be happy to answer any questions you may have on our testimony.

WATER POLLUTION CONTROL ACT AMENDMENTS

Subcommittee on Water Resources
Honorable Robert Roe, Chairman

November 1, 1983
Washington, D.C.

20-955 O—84——94

Leon Asadoorian
Robert Briant

Representing the
National Utility Contractors Association

Introduction

I appear before you as a representative of the National Utility Contractors Association (NUCA) and the Utility Contractors Association of New Jersey.

Our national association, NUCA, is comprised of 2,000 companies nationwide--contractors, suppliers, and manufacturers--that specialize in water delivery and wastewater treatment construction projects, particularly underground pipeline work. NUCA members lay the pipe and build the treatment plants necessary to achieve the goals set forth by Congress in the Federal Water Pollution Control Act. In short, we see it as our duty to build the projects necessary to meet the "clean water" requirements mandated by Congress.

As a result of our work in building many of the wastewater treatment facilities funded as a result of the federal statute now before this committee, we wish to take this opportunity to offer the utility construction industry's views on the program and to offer our recommendations on possible improvements to the Act.

Since early in 1982, NUCA and other organizations have mounted public education campaigns designed to draw attention to the nation's decaying infrastructure. Our association is also heavily involved in a long-term campaign called "Good Water, America", which is a coalition of groups raising the consciousness of the American people as to the water-related problems facing this nation both now and in future decades.

Partly as a result of the publicity that has been focused on the nation's infrastructure-related problems in recent months, many people are beginning to realize the decaying condition of our water delivery and wastewater treatment systems, and our highways and bridges. The even more crucial problem, however, has not been adequately addressed: how does the nation pay to repair and rehabilitate this network of public services?

NUCA members feel a partial answer to that question is provided in Section 3 of Committee Chairman Howard's proposal, H.R. 3282. In short, the legislation reauthorizes the EPA Construction Grants program through FY 1988 at increased yearly funding levels.

Reauthorization

As you know, legislation adopted by Congress in 1981 extends the sewage treatment construction program only through fiscal 1985. It was only through the tireless efforts of Chairman Roe and this subcommittee that this extension was achieved. President Reagan has made it clear he then intends to turn over the program to the states as part of his "new federalism" approach to government. Under this plan, funding for the wastewater treatment program would be incorporated into a block grant and, eventually, would be the responsibility of the individual states.

In our opinion, this approach would deal a serious setback to this nation's clean water effort. The "new federalism" plan would provide states with one lump sum of money for a wide variety of federal programs, including wastewater treatment.

State and local officials would then have discretion in deciding which of the programs would receive funding. It has been our experience that, unless funding is specifically earmarked for that purpose, many local political leaders are hesitant to dedicate funding for the construction of sewer pipelines and wastewater treatment plants because they are not particularly popular. Sewage treatment plants are built away from the public eye; sewer pipelines are located underground--out of sight and, often, out of mind. As a result, most local officials would prefer to spend taxpayer dollars on more visible public projects.

A continuation of the federal Construction Grants Program is essential to meet the goals of the Clean Water Act and, as a result, we wholeheartedly support the reauthorization of the program through fiscal 1988.

Increased Funding

In addition, NUCA strongly supports increased yearly authorizations for the program. I want to say at the outset that, yes, as utility contractors we hope our industry would benefit from this increased funding through the competitive bidding system. But it is obvious from a number of recent studies that the current $2.4 billion annual appropriation for the program is inadequate to meet current or projected needs.

Bluntly stated, the problems confronting this nation's sewage treatment systems are acute, they are immediate and they are widespread across the nation. In the Boston area, much of the sewer system has been in operation for more than a century. Antiquated

wooden pipes still transport part of the city's waste, and authorities estimate the region loses 30 percent of its wastewater through aged, leaking pipes. Orlando, Florida, is prohibited from adding more homes to its already overloaded sewer system. One-third of all sewer lines in Albuquerque, New Mexico are so deteriorated that trucks traveling over them cause the pipelines and the highways above them to collapse.

The serious dilemma this nation faces is the result of long-term, massive underinvestment or, in the words of representatives of the National Governors Association before the Senate Environment & Public Works Committee, "The nation is confronting a crisis precipitated by insufficient and inefficient public investment in the maintenance and development of public works."

In times of reduced government and tightening budgets among the first items to be targeted for reduced funding are public works construction and maintenance.

All told, the EPA estimates it will cost $118 billion by the year 2000 in order for the nation's wastewater treatment systems to comply with current environmental requirements. Under current law, the projected federal share of those costs has been reduced to roughly $37 billion. While we are aware of the somewhat inflated projections contained in the EPA survey, there is little doubt the financial requirements for the remainder of this century are immense.

We also wish to bring to your attention the April, 1983, report by the Congressional Budget Office (CBO) entitled, "Public Works Infrastructure: Policy Considerations for the 1980s." The

report from this highly respected body states, "Inadequate sewer pipes and sewage treatment as well as insufficient capacity to handle storm runoff characterize many of the nation's 15,000 wastewater treatment systems ... but projected federal and non-federal outlays combined fall short of (projected needs) by about 24 percent."

The CBO report also indicates EPA and other federal agencies, under the appropriations ceilings now authorized, will spend an average of $3.2 billion on wastewater facilities each year between now and 1990. In order to meet all estimated needs, the CBO indicates federal spending would have to increase to an average of $4.2 billion each year between 1983 and 1990--roughly a 25 percent increase.

Additional statistics also support the need for increased funding for the construction grants program:

- The current backlog (total existing needs) for compliance with the Act is estimated at $92.6 billion, according to EPA;
- Approximately $8 billion in wastewater treatment projects ready for construction currently await funding;
- According to Pat Choate, co-author of "America in Ruins," it will cost $25 billion over the next five years alone to meet pollution control standards;
- Nearly one-half of the nation's communities are unable to add additional homes and businesses onto their sewage treatment systems because those systems are already operating at full capacity.

It is this last statistic that is particularly alarming. A sound network of basic public facilities is essential to the future economic growth of our nation. Studies indicate businesses and industries place the condition of an area's sewer and water system near the top of their list of criteria in determining whether to build, expand or relocate.

Perhaps the most convincing argument in favor of increased funding is to consider the financial risks involved in continuing with inadequate current funding levels ($2.4 billion annually). A mere reduction in funding from previous levels did not reduce the overall cost of our clean water needs. If anything, it has contributed to delays in construction which, in turn, will add to the total cost of the program.

We feel a $2.4 billion annual authorization represents a "penny wise and pound foolish" approach to the Construction Grants program. Low annual expenditures prolong the nation's clean water problems and, thus, prolong the very need for the federal program. Studies indicate that between 1976 and 1983, construction costs in this nation increased by 65 percent. Thus, the reduced annual appropriation for the program can be compared to running in place--we are barely keeping up with funding needs without making a real dent in the problem.

And let there be no doubt that the utility construction industry has adequate capacity to more than handle the increased construction additional funding would entail. Unemployment within our industry currently stands in the area of 30 percent. Businesses have cut back to the bone or closed their doors altogether as a

result of the decline in wastewater treatment construction. In addition, the projects that are currently being bid will be constructed at "bargain basement" prices as more companies compete for fewer construction projects.

The underutilized capacity currently existent in our industry is unprecedented, and the ripple effect this situation has on related industries such as engineering and manufacturing is obvious in the nation's unemployment rate.

State Loan Programs

There is little doubt the health of the American people and the health of our nation's economy would be well-served by authorizing funding increases for the construction grants program. However, we of NUCA and the UCA of New Jersey feel the statute should be amended to permit states to use all or part of their share of the EPA grant program in state loan programs.

In light of the immense price tag placed on meeting the nation's water quality goals, nearly every group and individual familiar with the problem--contractors, environmentalists, engineers, manufacturers and municipal officials--agree on one point: the need to develop alternative means of funding wastewater treatment systems, other than the federal construction grants program, is imperative.

NUCA has studied a variety of proposals and concluded that the most effective mechanism would be state infrastructure loan programs. The basic premise of state loan programs is quite similar to legislation introduced by a member of this subcommittee, Congressman Clinger, whose proposal would institute a federal infrastructure loan program.

In short, capital funds would be deposited in special state loan accounts and no- or low-interest loans would be awarded to eligible municipalities for the construction or repair of roads, bridges, water and wastewater treatment systems. Funds repaid to the program by these municipal governments, as well as any interest earned, would represent a source of capital for these and additional projects. Thus, loan repayments will maintain the equity capital of the loan program and provide it with a source of funds for subsequent loans.

The State of New Jersey has been in the forefront of this concept as a result of its "Infrastructure Bank" proposal, which is now being considered by the New Jersey State Legislature.

Simply stated, state officials estimate many more sewage treatment projects can be built through an infrastructure loan program than through the federal construction grants program. For example, if the Clean Water Act, as amended in 1981, receives its full authorization of $2.4 billion annually through fiscal 1985, New Jersey would receive a total of $385 million. The state still faces nearly $2.5 billion in additional construction costs to meet federally-mandated clean water goals. In other words, the state faces a $1.8 billion shortfall in funding, which may never be eliminated under the present grant system. Once a federal EPA grant is used for a particular treatment works project, that money is no longer available for other projects since the grants are not repaid.

Under the state loan program concept, however, the state agency--or Infrastructure Bank in New Jersey--would have authority to issue debt on behalf of localities for their portion of total

construction costs. A portion of the state program's capital could also serve to enhance the credit worthiness of localities which might otherwise not have access to public credit markets.

The bottom line is this: states maintain a priority list of thousands of wastewater treatment projects waiting to receive an EPA construction grant. Under the current grant program, only a small handful will receive funding while the remaining localities must either finance projects on their own or, more likely, postpone construction in hopes of receiving a federal grant at some future time. A low-interest loan from a state loan program would provide those municipal governments with an affordable source of financing and enable many more projects to go to construction.

One potential problem we see in the New Jersey plan is its failure to dedicate projected repaid wastewater treatment loan monies for additional sewage treatment projects. As the proposal is now worded, loans made by the bank that make use of federal EPA construction grant money must be earmarked for wastewater treatment construction. However, repayments of those loans--to be used as second and third generation loans--could be used for other projects unrelated to water quality improvement. In short, we feel the Congress should permit states to use their EPA grants in a loan program, but it should include language requiring that those wastewater loan repayments be dedicated toward additional sewage treatment projects.

User Fees

There is no doubt that the use of EPA grant money as loans will result in an increase in user fees paid by businesses and households. The increase, however, is not projected to be as high as

some have claimed. In New Jersey, for example, the average user fee for a system receiving a total of 63% in federal and state grants (55% federal and 8% state matching share) is estimated at $210 per year. Under a 63% no-interest loan, the user fee would rise to $279 per year.

In addition, Mr. Chairman, NUCA feels there is a crucial need for owners of American homes and businesses to pay increased rates for wastewater treatment services. The people of this nation have grown accustomed to paying artificially low user fees for sewage disposal services. Nationwide, a survey of 66 cities showed that the average family paid less than 50 cents per day for collection and treatment of their wastewater. It is this practice that is largely responsible for the decaying condition of many of our municipal sewer systems. The low rates determined by local authorities are hardly adequate to pay only for the cost of treatment plant or pipeline construction; they do not provide the funding necessary to operate and maintain the system in future years.

Wastewater treatment and disposal is a vital, yet costly, public service, and the American consumer must realize the true cost of that service.

In supporting an amendment to the federal clean water statute, we stress that this proposal would in no way <u>require</u> states to use their EPA grant as loans; it would merely <u>permit</u> those interested states to use all, part or none of their grant money as loans for wastewater treatment construction projects.

<u>Collectors, Rehabilitation, CSOs</u>

Utility contractors also feel it is critical Congress retain in its reauthorization legislation certain categories currently eligible for federal funding scheduled for inclusion in a set-aside

category in fiscal 1985. In particular, we strongly feel sewer rehabilitation, combined sewer overflow (CSO) correction and sewer collection systems remain as separate categories eligible for federal funding. Under the 1981 amendments, these categories are eligible for EPA construction grants funding only through fiscal 1984. Thereafter, a governor is permitted to set aside 20 percent of his State's annual EPA allotment for projects in these categories.

As a result, we feel federal funding for collection pipeline construction and other pipeline-related needs will be reduced significantly, making them dependent upon state and local funding. Unfortunately, only a small handful of states have collector funding programs at a time when the vast majority of municipal governments are facing severe budgetary restraints. Communities could raise money for these projects through the municipal bond market, but many are unable because they have reached their bonded debt limit.

In many regions of the nation, particularly--but not limited to--the older urban areas of the Northeast and Midwest, the major problem in meeting local water pollution needs lies not in additional wastewater treatment plant construction, but in overhauling and upgrading their sewer pipeline systems.

Rehabilitation and repair is crucial in correcting leakage in these systems. In 1980, EPA estimated that infiltration/inflow constituted 25% of total existing flow to the nation's treatment plants. As a result, plants were treating as much as one-third more water flow than necessary.

Combined sewer overflow (CSO) correction remains a critical and costly problem in many areas. Some cities with a significant

combined sewer system--single pipelines transmitting both sewage and rainwater runoff (collected via street drains)--contribute a large share of the pollutants in their waterways to CSO overflows.

There is no doubt that the construction of collector sewer systems is a crucial element in this nation's clean water effort. Wastewater treatment systems are just that: systems. The efficiency of a system is dependent upon each of its parts. Sound collector pipelines alone are inadequate if the treatment plant is obsolete and, conversely, a sophisticated treatment plant does little good if the pipelines carrying wastewater to it are aged, leaking and corroded. Significantly, 50% of the 1,400 city governments that participated in a National League of Cities survey said their wastewater collection systems need major repair.

Currently, approximately 66 million Americans are without sewer service. The alternative is largely the use of septic tanks. When operated and maintained properly by owners living on suitable soil, septic tanks can provide a cheap and efficient method of waste disposal. However, studies indicate that at any one time, 22 to 66 percent of the septic tanks in the United States are malfunctioning. More importantly, malfunctioning tanks are a major source of both groundwater and surface water pollution.

The recent EPA Needs Survey projects a need for over 73,000 miles of collector sewers by the year 2000 costing some $40 billion. If forced to bear the burden of financing collector construction, communities of all sizes would be hard-hit. Municipalities with a population of 25,000 or less would be particularly affected because, due to a lower population density, collectors

constitute nearly 80 percent of the total project cost. Eliminating collector sewer eligibility represents a "big city" bias in the program by unfairly penalizing smaller communities.

Mr. Chairman and members of the committee, as utility contractors who replace existing sewer pipelines on a daily basis, we have a unique first-hand knowledge of the condition of these collector lines. Often, they have been in use for nearly a century. Many are constructed of outdated materials such as wood or brick. They are cracked, broken and corroded beyond repair due not to faulty materials, but due simply to age, overuse and neglect. Our position can best be stated by citing a recent survey which found that from half to as much as 90 percent of the flow in some urban collection systems is ground and surface water as a result of infiltration-inflow. We contend that replacing or repairing collector sewers would result in the need for treatment plants with a lower capacity than are now being built.

There is little doubt that the EPA, under the Gorsuch administration, emphasized the awarding of grants for treatment plant construction rather than collection system construction, sewer rehabilitation or CSO correction. In its most recent survey estimating a current backlog of some $92.6 billion in construction needs, the agency estimates $16.8 billion, or 18 percent, of the nation's current clean water needs lie in the construction of collection systems. Yet, figures compiled by EPA indicate only 9 percent of construction grants money was obligated for that purpose in 1982. The backlog of needs for combined sewer overflow correction is even greater.

As previously mentioned, collector pipeline construction, rehabilitation work and combined sewer overflow correction will still remain eligible for federal funding after fiscal 1984 when the three categories are lumped together as part of each Governor's 20 percent set-aside fund. However, given the importance of these functions in the overall clean water effort, we strongly feel they should be retained as separate categories eligible for federal funding. Shifting them to a set-aside program would, in our view, a.) send a signal to state and local officials that these categories are of less importance, and b.) as a result, lead to reduced funding for those categories of projects.

Without adequate funding for collector pipelines, this nation's war on water pollution is being waged with a half-empty arsenal. NUCA strongly urges the committee to amend Title II of the existing statute by making collector sewers again eligible for federal funding, as separate categories, along with the rehabilitation and CSO categories.

Non-Point Sources, Other Issues

The association also feels Congress should take action in order to avoid delays in issuing dredge and fill permits under Section 404, the wetlands protection provision.

Specifically, we recommend that Section 401 (a)(1) be changed to decrease the amount of time for Section 401 Water Quality Certification. Current law permits a period of one year, which results in a major delay in the 404 program. We urge the committee to make other changes designed to speed up EPA's response to state program transfer requests. In addition, permits should be reviewed after a five-year period rather than automatically expire.

As stated earlier, we feel these changes and other steps taken by the committee should expedite the "dredge and fill" program contained in Section 404.

We also understand that consideration is being given to further limiting the granting of waivers from secondary treatment requirements for discharge into estuarine waters. While additional restrictions on the granting of waivers would result in additional construction jobs for contractors, NUCA supports the current practice of considering each waiver request individually. In so doing, each application is judged on its own merits, and funding for costly and unnecessary construction can be targeted elsewhere.

Lastly, a number of measures have recently been proposed to control non-point sources of water pollution. While we realize the increased concern is directed toward eliminating these potential sources of pollution, we suggest, as have other expert witnesses before us, that insufficient data currently exists as to the identity of non-point source pollution and the cost to correct it. We would suggest that until adequate research has been conducted in this area, Congress concentrate on earmarking what federal funds are currently available toward correcting problem areas that are identifiable and correctable: point sources of water pollution.

SUMMARY

Mr. Chairman and members of the committee, in closing we wish to reiterate our wholehearted support for the reauthorization of the construction grants program at increased funding levels

through fiscal 1988. In order to further increase the effectiveness of this vital program, however, we again urge you to amend the Act in order to permit states to use their grant allotments as loans for wastewater treatment projects. In addition, the continued eligibility of collection, rehabilitation and combined sewer overflow projects for federal funding is imperative to the success of the clean water effort.

This nation has made significant progress in its effort to clean our waters, yet the job is only partially complete. To those who may be critical of the costs involved and their impact on the federal budget, we offer this analysis: a reduction in the federal budget is dependent upon economic growth, and economic expansion is dependent upon a sound infrastructure. Inadequate sewage treatment is a major obstacle to economic development, and is a crucial element in the nation's economic recovery. As the utility contractors of this nation, we stand ready and able to contribute to the twin goals inherent in this EPA program: environmental quality and economic growth.

Thank you for your kind attention.

20-955 O—84——95

Mr. ROE. Please proceed.

TESTIMONY OF LEON ASADOORIAN, PRESIDENT, METHUEN CONSTRUCTION CO., METHUEN, MASS.; AND ROBERT BRIANT, EXECUTIVE DIRECTOR, UTILITY CONTRACTORS ASSOCIATION OF NEW JERSEY, EDISON, N.J.

Mr. ASADOORIAN. Thank you, Mr. Chairman.

Mr. Chairman and members of the subcommittee, our national association, the National Utility Contractors Association, is comprised of some 2,000 companies nationwide, consisting of contractors, suppliers, and manufacturers that specialize in water delivery and wastewater treatment construction projects. On behalf of all of our members, I want to thank you for the opportunity to present our testimony from the perspective of those who construct the pipelines and build those treatment plants necessary to achieve the goals set forth by Congress in the Federal Water Pollution Control Act.

Many public education campaigns, those conducted by NUCA and other groups, have been very successful in one important aspect: Many people are beginning to realize the decaying condition of our water delivery and waste water treatment systems, as well as those of our highways and bridges. The even more crucial problem, however, has not been adequately addressed: How does this Nation pay to repair and rehabilitate this network of public services?

We wish to take this opportunity to offer the utility construction industry's viewpoints on the program and to offer our recommendations on possible improvements to the act. We will confine our testimony to title II of the legislation that is being considered.

In light of the time limitations, I wish to submit for the public record a copy of our complete testimony and briefly summarize it for you. We will then be able to answer any questions or attempt to answer any questions that you may have.

Mr. Chairman, members of the utility construction industry strongly feel a partial but important answer to the question of how to alleviate the Nation's water pollution problem is provided in section 3 of Chairman Howard's proposal, H.R. 3282. In short, that provision reauthorizes the EPA construction grants program through fiscal year 1988.

Legislation adopted in 1981 through the tireless efforts of yourself and this subcommittee extended the sewage treatment construction program only through fiscal year 1985. The President has indicated his desire to then fund the program through block grants to the States.

In our opinion, this approach could deal a serious setback to this Nation's clean water effort. Under the block grant approach, State and local officials would have discretion in deciding which of a wide array of programs would receive funding. Unfortunately, funding for sewer pipelines and treatment plants is not politically popular. It has been our experience that unless funding is specifically earmarked, many local government officials are extremely hesitant to dedicate funding for sewage treatment projects. There-

fore we feel a continuation of the Federal program is essential to meet the goals of the Clean Water Act.

In addition to reauthorizing the construction grants program, another recommendation the utility construction industry feels is crucial to the future of the Nation's clean water efforts is the critical need for Congress to retain in its reauthorization legislation certain categories currently eligible for Federal funding that are scheduled for inclusion in a set-aside category in fiscal year 1985.

Specifically, we urge you to insure that sewer rehabilitation, combined sewer overflow correction and sewer collection systems remain as separate categories eligible for Federal funding. Under the 1981 amendments, these categories are scheduled for inclusion in each Governor's 20 percent set-aside fund beginning in fiscal year 1985.

In many regions of the Nation, the major problem in meeting local water pollution needs lies not in treatment plant construction, but in upgrading their sewage collection systems. I brought with me, as you noted, and I have some photographs of a section of collector pipe recently replaced in the Boston area for a project that we did. As you can see, corrosion and the accumulation of sediment over many decades of use have made this pipe ineffective and without the capacity that it was originally designed.

Section of cast iron pipes, installed in 1880 at Commonwealth and Arlington streets, Boston, Mass. Note significant reduction in internal diameter caused by age and internal corrosion.

Photo A.

Photo B.

Photo C.

Mr. ASADOORIAN. Unfortunately, the condition of this pipe often represents the norm rather than the exception in many areas. Many of these pipelines have been in use for over a century. They are cracked, broken, and corroded beyond repair. EPA estimates that leakage into these pipes constitutes 25 percent of the total existing flow to the Nation's treatment plants. As a result, we contend that sound collector sewer systems would result in the need for lower capacity—and less costly—treatment plants.

Mr. Chairman, waste water treatment systems are just that: systems. The efficiency of a system is dependent upon each of its parts. Sound collector pipelines alone are inadequate if the treatment plant is obsolete and, conversely, a treatment plant—regardless of its degree of high technology—does little good if the pipelines carrying waste water to it are aged, leaking, and corroded.

Significantly, a National League of Cities survey finds that 50 percent of 1,400 participating city governments said their waste water collection systems need major repair. Smaller communities in particular, where collector pipeline construction constitutes nearly 80 percent of total project cost, would be particularly hard hit if collector funding is reduced.

In short, the utility construction industry feels collection systems in particular, as well as rehabilitation and combined sewer overflow correction, must remain as separate categories eligible for Federal funding. While they would remain eligible when lumped together under each Governor's discretionary fund, shifting them to a set-aside program would, in our opinion, send a signal to State and local officials that these categories are of less importance and, second, as a result, lead to reduced funding for them. Without adequate funding for collector systems and other pipe-related needs, this Nation's war on water pollution is being waged with a half-empty arsenal.

My colleague, Mr. Bob Briant, will now offer the remainder of our testimony.

Mr. BRIANT. Thank you, Leon.

Mr. Chairman and members of the subcommittee, in addition to reauthorizing the program and retaining certain separate categories, NUCA strongly supports increased yearly authorizations to fund it. I want to say at the outset that, yes, as utility contractors we hope our industry would benefit from this increased funding through the competitive bidding system. But it is evident that the current $2.4 billion yearly appropriation is simply inadequate to meet current or projected needs for clean water.

As a result of massive underinvestment in properly maintaining existing systems, and in projecting future needs, the EPA estimates $118 billion will be needed by the year 2000 to comply with Federal water quality requirements. While we are aware of the somewhat inflated projections contained in the EPA survey, other studies and statistics leave little doubt the financial requirements are immense.

Perhaps the most significant statistic is the survey indicating that nearly one-half of the Nation's communities are unable to add additional homes or businesses onto their sewage treatment systems because they are already operating at full capacity. In New Jersey, nearly 20 percent of our communities experience such bans.

Simply stated, these basic public facilities are essential to the future economic growth of our Nation.

Our industry feels the current $2.4 billion annual appropriation represents a "penny-wise and pound-foolish" approach to the construction grants program. A reduction in funding to the $2.4 billion figure did not reduce the overall cost of our clean water needs. If anything, construction delays resulting from decreased funding have added to the total cost of the program when you consider that construction costs in the United States rose 65 percent between 1976 and 1983.

We compare the $2.4 billion annual figure to running in place—we are barely keeping up with current funding needs without making a real dent in our overall needs.

And let there be no doubt that the utility construction industry has adequate capacity to more than handle the increased construction additional funding would entail. Unemployment within our industry presently hovers at the 30-percent mark. Hundreds of businesses have closed their doors as a result of declining waste water treatment construction. Engineering and manufacturing interests have also suffered severely. And communities have, in many cases, placed plans on the back burner.

After initial delays in obligating appropriated funding due to the regulatory changes required by the 1981 amendments, the EPA Office of Water, under the able administration of Henry Longest, is doing a good job in expediting the obligation of grants to municipalities. As of October 2 of this year, only $1.2 billion remained in fiscal 1983 appropriations. I think you will agree, Mr. Chairman, that this figure is substantially lower than corresponding unobligated moneys from previous years and is an indication that additional funding is needed for the program.

In addition to increased funding, however, we of NUCA feel the statute before you should be amended to permit States to use all or part of their share of EPA construction grants as loans. My own State of New Jersey has been in the forefront of this concept with its "Infrastructure Bank" proposal, which is now being considered by the State legislature.

In short, the New Jersey proposal would operate as follows: Capital funds (Federal, State, and private) would be deposited in special State loan accounts to be awarded as no- or low-interest loans to eligible communities for the construction or repair of roads, bridges, water, and waste water treatment systems. Loan repayments would represent a source of capital for additional loans for future construction.

State officials estimate many more sewage treatment projects could be built through this type of loan program than through a strictly grant program. Once a Federal EPA grant is used for a particular project, that money is obviously no longer available for other projects because the grant is not repaid.

The bottom line is this: Under the grant program, only a small handful of communities will receive funding while the remainder must finance projects on their own or, more likely, postpone construction in hopes of receiving a Federal grant at some distant future date.

One potential problem we see in the New Jersey plan is that while initial EPA grant money would be required to be loaned for waste water treatment projects, it fails to dedicate repaid sewage treatment loan moneys for that purpose. In short, we feel Congress should permit States to use their EPA grants in a loan program, but language should be included requiring that those sewage treatment loan repayments be dedicated for additional sewage treatment projects.

We stress that this proposal would in no way require States to use their EPA grants as loans. It would merely permit interested States to use all, part or none of their grant money as loans for waste water treatment construction projects.

There is no doubt this practice will result in increased user fees paid by businesses and households—not to the degree, however, some opponents to the plan claim.

Mr. Chairman, the people of this Nation have grown accustomed to paying artificially low user fees for sewage disposal services. Nationwide, a survey of 66 cities shows that the average family pays less than 50 cents per day for the collection and treatment of their waste water. These low rates are largely responsible for the decaying condition of many systems. Waste water collection, treatment, and disposal is a vital, yet costly service, and the American consumer must realize the true cost of that service.

Lastly, a number of proposals are being considered to control nonpoint sources of water pollution. We suggest, as have other witnesses before us, that insufficient data currently exists as to the technology and cost involved in correcting the nonpoint source problem. We feel that until further research has been conducted in this area, Congress should concentrate on earmarking its limited funds on correcting identifiable and correctable problems; namely, point sources of water pollution.

Mr. Chairman, in closing, we wish to reiterate our wholehearted support for the reauthorization of the construction grants program at increased funding levels through fiscal 1988. In order to further increase the effectiveness of this vital program, however, we again urge you to amend the act to permit States to use their grant allotments as loans for waste water treatment projects. In addition, the continued eligibility of collection, rehabilitation and combined sewer overflow projects for Federal funding is imperative to the success of the clean water effort.

This Nation has made significant progress in its effort to clean our waters, yet the job is only partially complete. To those who may be critical of the costs involved and their impact on the Federal budget, we offer this analysis: A reduction in the Federal budget is dependent upon economic growth, and economic expansion is dependent upon a sound infrastructure.

We thank you for giving us the opportunity to appear today and we will be happy to answer any questions you may have regarding our testimony.

Mr. ROE. We want to thank you very much for your splendid testimony. I do not have any questions. If I were writing the bill myself, we would have the matter resolved, and I am sure the committee would too, but we have other people that we have to deal with. So I do not have any particular questions at this point.

The gentleman from Arizona.

Mr. McNulty. Thank you, Mr. Chairman.

Mr. Asadoorian, pipelines have a thing, a dog or a cat or a pig, they call it, that run through lines, and clean them out as they go along. Can a similar device be used in a collector of that diameter?

Mr. Asadoorian. Yes, there are devices that are available. However, over a period of time the sedimentation becomes so solidified that it is not a practical solution.

Mr. McNulty. Thank you.

Mr. Roe. The gentleman from Oregon.

Mr. Smith. Thank you, Mr. Chairman.

I am wondering, under your loan grant discussion, whether or not you would advocate some sort of a local or State match in a loan program?

Mr. Briant. As a matter of fact, sir, we have such a match in our State of New Jersey. I suspect that a number of States around the country have a matching program.

Beginning with this year, New Jersey's match is a loan, so that the New Jersey funds that match the Federal EPA funds are in the form of a loan to a particular community. We feel that a combination of loans and grants really are going to serve the Nation's purpose in clean water.

Mr. Smith. What is your match?

Mr. Briant. Eight percent, sir.

Mr. Smith. Eight percent, and it is 92 percent, 8?

Mr. Briant. No, as a matter of fact, it is 8 percent of the eligible cost of the project. Just as EPA's funding, up until this year, has been 75 percent of the eligible cost of construction.

Mr. Smith. You see, one of the concerns that I have at this moment in the discussion is the grant program is a one time program. A loan program could be an elongated situation, establishing a sinking fund, or even more horribly to say, entitlement.

What do you say about that?

Mr. Briant. Well, I think the loan program, as we envision it in New Jersey, is one that is not a loan program to pay out. Depending on the ability of a community, they may choose a 15- or 20-year payout plan.

I think one of the ideal aspects of the loan program, though, is something that some people—not this committee, of course, fail to realize, and that is that the repayment of the loans puts the moneys back into the system again, which then can be utilized by future communities to resolve their clean water problems.

But in this day and age of capital construction, I do not believe a 15- or 20-year payout period is really an elongated period.

Mr. Smith. Thank you.

Mr. Roe. Are there any further questions?

Well, just one thing on that loan program, quickly.

You know, being from New Jersey, we are familiar with that issue, as is Mr. Howard and others, and I think the gentleman from Oregon brings up a very good point.

Would it be reasonable to assume that the State of New Jersey has elected, under the provisions of the last amendments, to reduce the Federal matching grant, to 55 percent, which has created its own problems in many communities, as I am sure you are aware.

What would be so—or should we be considering some kind of a loan program that will make it dollar for dollar, for what was used in the loan program?

Suppose, for the sake of discussion, you know, 8 percent is not very much, in comparison to 55 percent, and that is not really an incentive at this juncture for the committee to make that kind of a broad-based determination. But I am wondering along the line, following the thought processes developed by the gentleman from Oregon, what suppose, for example, we were to allow some flexibility, but made it dollar for dollar match coming back to the States.

Suppose, for example, instead of the 55, we came back and said, well, New Jersey, if you want to spread it out to lesser than the 55 percent, but in any case, it should not be lesser than 55 percent in the aggregate, with the State putting up half of those costs.

Mr. BRIANT. Mr. Chairman, I believe that a combination of grants and loans, in whatever percentages, would be right for a particular community, would be the best direction to go, and why I say that is that there are some communities in some States that may have greater wherewithal to produce the local share than would others.

So I think really the system that should be designed is one that is flexible enough that would combine grant money and loan money in such a way to make the project financially feasible for that particular community, which might be a little bit different than another community 20 miles away.

Mr. ROE. If the gentleman would yield, however.

We had the gentleman from Mount Holly testify, and we are well aware of that case, because we had a similar situation existing in Paterson, where most of the dyeing and finishing industries have to literally go out of business because they cannot pay $100,000 in sewer costs.

So we say that the impact, whether it be a loan or grant, is not devastating to many industries, it is. In other words, what we are saying to Mount Holly is that if we do not do something to correct, or at least alleviate that situation, they are faced with, they will have to go out of business. They will lose 60 jobs. What did we achieve?

Mr. BRIANT. There is no doubt about that. I believe that the problem in that particular case, although I did not pay close attention to the testimony, was one that dealt with the industrial cost recovery system of figuring cost for industrial users.

Mr. ROE. Oh, I understand that. That is a problem in the Federal law. But I am saying it is still a manifestation of what we are talking about.

The idea that the average citizen can pay x number of dollars, or y number of dollars, which is a variable, as you know, from known experience in every single project we build, is not necessarily an accurate statement.

For example, when you have got a situation in that Ocean County system in New Jersey, where those rates have risen to $600 or $700, and people in that area are mostly on retirement with $7,000 to $8,000 a year in income, and they are going to pay 10 percent, or 12 or 14 percent of their costs for a surcharge, they are not going to be able to maintain their homes.

So, I think when we speak to what those charges should be, and that is where the dilemma lies. You know, it was all well and good for New Jersey to drop those grants, what would you say, level of grants, from 65 percent to 55 percent, because they thought they would have a wider distribution. But they then had to go back to those communities, they had already gone into their local bonding, and had provided the 25 percent, and had to go back and fund all over again, as to what the local cost would be, and that bothers us extremely, as far as this committee is concerned.

Mr. BRIANT. Yes; that is a real concern, that is why I think we really have to combine the grant money with the loan concept, and we cannot do away with that grant money, and of course, the level of the grant is something that the individual States have to deal with.

Mr. ROE. Let me handle it further.

Should we come back and say, well, OK, in view of the fact that we think the local States, or some people ought to be applying more, should we come back and mandate it that the Governor of a State elects to, at 55 percent, which they have the prerogative to do? As you know, under the existing amendments, made last time, the State has to put up 25 percent to be eligible.

Mr. BRIANT. I think there is no doubt that the States' share should be one that is more reasonable a level. I am not happy myself with an 8-percent State share, although I do understand that some States do not have any State matching levels.

Mr. ROE. Well, I agree with you. But I am saying suppose we thought about that, and get back and say well, we are going to put up 50 percent money here, 55 percent money, the States ought to be putting up 25 percent.

Mr. BRIANT. I think that is a valid observation, Mr. Chairman.

Mr. ROE. That would be an interesting amendment, would it not?

Are there any further—the gentleman from Wisconsin.

Mr. MOODY. Thank you, Mr. Chairman.

I think we have a minute or two before we have to go vote.

I want to thank you for your excellent testimony, both of you. You have written a very good paper here.

I do have a question about the—two things.

You suggest that we retain the separate categorization for sewer rehab, CSO and sewer collection, rather than permitting those to be a single source of funds, and yet the argument that you advance is that investment in one is only a substitute for investment in another, as you point out, with your pipe, you can save money downstream by doing something upstream, or vice versa.

Or, if you have a better collection system, with less infiltration inflow, you may need less capacity in your sewer treatment. All of these are, as you point out, one system.

Well, if that is true, then we really, as a Federal Government, may not be in the best position to decide how the money should be earmarked within a given system, that should be something that local authorities probably have a better handle on, and by breaking the categories into smaller and smaller compartments, we are forcing the funding into an area that may not be the most optimum.

If you give the local agencies more discretion to move the money, they may get more bang for the buck, because they are not con-

strained to put it in this collection, where they maybe should be putting it into plants.

So I agree with your arguments, but they seem to lead to the—I would think they lead to the opposite conclusion.

Could you comment on that?

Mr. ASADOORIAN. Two issues, Congressman.

One is that each State, as you know, has been delegated the responsibility to set the priority lists, based on its individual environmental concerns, and based on our experience in region 1, we find that the priority lists that have been established by the various States have clearly spoken to the most cost-effective environmental methods of correcting its sewage treatment problems.

What we are asking for, and suggesting, is that these categories remain eligible, not mandated with any specific amount of money necessary to be spent within those various States. So that the States and the local regions have the option available to expend the money in the most cost-effective means.

Mr. MOODY. OK. I think maybe we do not disagree at all.

You have no problem with local decisionmaking, allocating the money as between those three places, do you?

Mr. ASADOORIAN. That is right.

Mr. MOODY. But why then do we want to retain them as separate categories, funding categories, since we want to have the money fluid between categories? Why not just call it an overall category? Why do you want separate? Why do you want to fund them separately by category?

Mr. BRIANT. Actually, what we are really saying is not separate categories, but remain as eligible categories under the Federal program.

You may recall that in 1981, when the amendments were passed, EPA was trying to mandate that no money would be available for collector sewers.

Where we find in many parts of the country collector sewers are a vital part of the sewage treatment system. Because the committee and the Congress saw to the needs, they kept collector sewers as an eligible category, through 1985, with 20 percent of all moneys from that point onward being used at the discretion of a State Governor.

What Mr. Asadoorian is pointing out, is that the local governmental agencies, the States, based upon their State priority lists, and the water quality needs, know best how to apply that Federal grant money, whether it be collectors, interceptors, or treatment plants.

Mr. ROE. If the gentleman would yield?

Mr. MOODY. Surely.

Mr. ROE. I wish they did, but there is not one single one in the State of New Jersey on the priority list, because the premise initially, and you are very adroit in your testimony, that we are speaking of sewage disposal systems, and they are variable in every region of the country.

In Boston, particularly, in Paterson and New Brunswick, they have combined wooden sewers. Now, if you are going to solve the pollution problem in the receding streams, you have to eliminate

those combined sewers, and they have to be done on an eligible basis, like anything else.

I had a meeting in New Brunswick, where the Johnson & Johnson Co. is spending $150 million, to rebuild that city, and they are under all kinds of mandates and orders from EPA. They have to correct the combined sewer, because they are polluting the river. Every time it rains it washes back into the system, and the truth of the matter is that the battle was fought with the Senate, and there was a temporary decision, as far as I am concerned, because the goal there was to eliminate all of those eligible categories completely. And you take in, responding in your city of Boston, to really do the job that ought to be done, then the flexibility ought to be there, but it ought to be mandated as part of the system that has to be dealt with. Not allow the State to say well, we can quote unquote get more bang for the buck by building a plant, and the plant for 500,000 gallons a day, and they have 1½ million going into it every time it rains.

So, no matter how beautiful the plant is built, or how big the plant is, it does not make a damn bit of difference at that point. It is a total waste of the public's money, if you will pardon my enthusiasm, but we have been through this drill since 1972.

So you are right, and they are right, but it should not be even categorized, it ought to be a decision that ought to be allowed by States, but it ought to be mandated, if they have to clean that up as part of their process, and I think that is a reasonable approach.

Now, we are on the second call.

Mr. MOODY. I just was hung up on the word separate in that sentence. I mean, you really just mean eligible categories?

Mr. ASADOORIAN. That is right; yes.

Mr. ROE. Now, let me suggest the following. We only have three witnesses left, and we have a few more questions, so if you could, let us recess for 10 minutes, and go and vote, and we will return immediately to complete our work, so we do not have to keep people over.

The committee will recess for 10 minutes.

[Short recess.]

Mr. ROE. The committee will reconvene.

We were finishing up our discussions with Mr. Asadoorian and Mr. Briant from New Jersey. I do not really have any further questions.

Are there any further questions here?

Mr. SMITH. No.

Mr. ROE. Thank you for being with us. We appreciate your testimony, and you have our fullest attention, of course.

Our next witness is Mr. Lawrence A. Salomone of Poolesville, Md.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF LAWRENCE A. SALOMONE, POOLESVILLE AREA CITIZENS

Mr. Chairman and Members of the Committee:

In 1979,the EPA Administrator stated, "for every Federal dollar that is already cleaning up our water, another $11 have been in construction of plants that have yet to process a single kilogram of wastewater"[1].

Many towns that have received funds from the Federal Construction Grants Program now have defective sewerage treatment systems and long-range financial burdens. EPA's own data indicate that as many as 50% of the Nation's wastewater treatment facilities fail to operate properly, due to such factors as improper system design and installation, poor operator training, and inability in some cases to attract qualified personnel [1]. A major issue of growing concern to me as well as to some of your colleagues is the financial impact of the grants program on State and local governments [1]. A number of them have begun to conclude that the costs of operating and maintaining these new facilities may represent 65-70% of total costs, placing a harsh and often unanticipated burden on local citizens [1]. Another area of concern examined is user fees, with which municipalities

are supposed to support the operation and maintenance of the plant as well as future equipment replacement. Based on GAO surveys of municipalities in 10 States, it was reported that most municipalities are not charging adequate user fees to cover both current and future costs.[1]

Moreover, the EPA and the States should make the right selection of stream uses, that these are realistic and attainable uses, particularly when low stream flows (intermittent streams) and background pollutants (such as caused by non-point sources) would make achievement of fishable/swimmable quality impossible. These nonpoint sources of water pollution are estimated to be 50% or more of total pollutant loads of our nation's lakes and streams [1].

It should be clear that the Construction Grants Program is not working well [1]. Perhaps, now is the time for reconditioning and fine-tuning so that the available funds can be used more effectively to protect the environment. For this purpose, I would like to provide you with information regarding the need, approach, and costs for a proposed sewerage treatment plant in Poolesville, MD where I have lived for 4 years. This information represents the results of a two (2) year investigation performed by several residents of the Town and me and it will serve to illustrate why the Construction Grants Program should be fine-tuned.

The town of Poolesville (population 3500) in upper Montgomery County, is seeking a new federally funded $2 million tertiary treatment plant that would allow the Town to double in size [2]. Approximately one half of the capacity of the proposed plant is to serve non-existent citizens that, of course, have no effect on water quality.

The majority of its citizens (85%) is challenging the Town Board of Commissioners on the wisdom of building the plant, calling it too big, too costly, too sophisticated and unnecessary [3]. Seven (7) years of water quality data show that the environmental need for the plant is non-existent or very minor. The basis for Poolesville residents opposing the EPA Construction Grant include the following:

1. The environmental need for the proposed wastewater treatment plant is non-existent or very minor [4]. The EPA is providing $2 million to maintain the water quality of an intermittent creek as fishable/swimmable. Dry Seneca Creek as the name implies is dry during periods of drought. During non-drought periods 7 years of water quality data show that its water quality is above existing water standards [5].

2. Present and future costs seem to have been grossly underestimated [6 and 7]. The Town Auditor stated in a public hearing on May 16, 1983 that present water and sewer costs are $5.60 per thousand gallons. Yet, the

town's engineer and the Commissioners of Poolesville have documented $3.83 per thousand gallons as the present water and sewer costs in the affordability analysis provided to EPA Region 3 and the State of Maryland. Regarding future costs, the Poolesville Town Board made no public statement of the financial impact of the proposed project until the release of their May 13, 1983 newsletter. Approximately two years after the August 10, 1981 public hearing required by law for this project, the Poolesville Town Board stated in this newsletter that the proposed plant would result in a $0.25 per thousand gallon-increase to the current water and sewer rate (i.e., $20 to $30 per year to the total water and sewer bill for the average household). The Poolesville Town Board restated this increase of $0.25 per thousand gallons in a public hearing on May 16, 1983. Can it be possible that the proposed tertiary treatment plant to serve twice the present population of Poolesville can be built, operated and maintained for $0.25 per thousand gallons?

3. A large imbalance exists between the high costs of the proposed plant and the minor environmental benefit;

4. The proposed treatment plant is planned for construction before the major inflow and infiltration problem of the collection system is solved (i.e., 1 million gallons per

day during storms--three times the normal flows to the existing treatment plant);

5. With the environmental need for the proposed plant being non-existent or very minor, the Poolesville Construction Grant will be providing funds essentially for development and expansion purposes which is contrary to existing regulations;

6. The shortage of available potable water to meet the needs of the current residents suggests that our health and safety will be jeopardized further by construction of the proposed wastewater treatment plant with its demand for twice as much water as is currently available [8] and

7. The selection of an activated sludge treatment process is too sophisticated and too costly to operate and maintain for a small town like Poolesville, MD. Furthermore, existing regulations require the use of the present system, if possible, to meet the required effluent discharge limitations. Improvements to the existing lagoon to satisfy the required effluent discharge limitations were recommended by the previous engineering consultant to the Town of Poolesville--a recommendation ignored by the Town.

20-955 O—84——96

Despite these legal, technical, and economic reasons, and the fact that less than 10% of the projects funded actually are complete and contributing to water quality improvement [1], EPA Region 3 and the State of Maryland is ready to add Poolesville Maryland to the list of towns with a wastewater treatment system that is more than the locality needs or can pay for [9a and 9b]. Poolesville may well join the list of communities which include e.g., Manassas and Manassas Park, Va., Toms Brook , Va., and Thayne Wyoming.

The Poolesville situation is symptomatic of a much deeper problem with the way the Construction Grants Program is being administered. The transcript of the public hearing on Poolesville's proposed wastewater treatment plant shows that the concerns of all residents and an official of the State of Maryland were not adequately addressed or their questions completely answered. Yet, there was no requirement nor mechanism to ensure that questions (such as cost and inflow/infiltration reduction) raised during the public hearing were properly answered. This is a weakness in the hearing process that should be corrected.

Ignoring the 7 years of water quality data for Dry Seneca Creek, the engineers proposed, the Town Board accepted, and EPA Region 3 and the State of Maryland supported an inappropriate technology for the Poolesville situation. The costs and benefits of using the proposed technology are significantly out of balance. Water quality data should be used and good water quality

monitoring programs should be established to keep decision makers from making costly decisions, based on the lack of information or on misinformation. The Clean Water Act should be amended to provide that compliance orders shall include cost-benefit analyses.

Future costs of federally funded wastewater treatment plants are frequently underestimated. In the case of Poolesville, even present costs were grossly underestimated [6 and 7]. The user charge system required by the Clean Water Act should reflect all the components that will be necessary to maintain the financial integrity and self-sufficiency of the system. In the case of Poolesville, EPA Region 3 suggested to the Town's engineering consultant that the cost of expanding the local potable water system to meet the needs of the proposed plant be considered [10]. These costs were not included in the application [9b]. The Clean Water Act should be amended to ensure that all relevant costs are included in the user charge system to ensure that the affordability analysis is performed using representative cost figures.

The federal government under the Clean Water Act should not continue to offer large sums of money to a small community and expect that the local community board members are knowledgeable in the proper disbursement of these funds. Some of the post mortems done on towns with defective treatment systems and long-term financial burdens show that towns cannot always rely on the advice of their engineering consultants and the EPA [11 and 12].

Treatment plants have been overdesigned, and the treatment process selected have not been compatible with the ability of the community to operate and maintain the system [11 and 12]. The Clean Water Act should be admended to enhance accountability.

This concludes my statement. I will be pleased to provide additional information as requested.

Lawrence A. Salomone, P.E.
19108 Hempstone Avenue
Poolsville, Maryland 20837

Dear Mr. Salomone:

This is in response to your letter of May 13, as well as conversations you have had recently with members of my staff regarding the proposed Poolsville Wastewater Treatment Plant. I can certainly understand your frustration in this matter, for it is obvious that you have spent a good deal of effort to research this situation, and it is also obvious that you are particularly well-qualified to comment on this issue.

You have asked my office to assist you by putting you in touch with those who are reviewing the Clean Water Act. On your behalf, I have therefore written to Representative Robert A. Roe, Chairman, Subcommittee on Water Resources, of the Public Works and Transportation Committee. I am informed that this subcommittee will be considering amendments to the Clean Water Act, and I have asked that his staff review some of your documents and put your name on the list of interested parties to this legislation.

Your dissatisfaction with the current grants program is shared by many, including some of my colleagues in the House, who have begun to question whether the program needs to be funded at such a high level year after year. There are also those who share your concern that in some localities the standards may be unnecessarily high and result in systems that are simply more than a locality needs or can pay for. On both sides of the issue there are those who argue that the program is overly complex. I have enclosed some Issue Briefs from the Library of Congress that I know will be of interest to you, and you can be sure that I shall be back in touch with you when I have heard from Congressman Roe.

With best regards,

Sincerely,

Beverly B. Byron

MAJOR ISSUES SYSTEM

DATE ORIGINATED 04/10/80
DATE UPDATED 11/08/82

ISSUES AND POLICY QUESTIONS

Interest in the construction grants program and concern for its future raise three key questions: Are the water cleanup goals of the Act being achieved through expenditures under this program? What effect will shrinking appropriations, increasing need for funds, and inflation have on those goals? How should the sizable investments be weighed against competing national priorities?

The 1972 legislation perhaps underestimated the magnitude of the water cleanup task mandated for municipalities and industries, in turn leading to underestimation of the time and resources necessary to achieve the ambitious goals of the Act. Despite the $30 billion obligated and $20 billion expended, the Nation is still a long way from reaching the objective in the Clean Water Act of restoring and maintaining "the chemical, physical, and biological integrity of the Nation's waters." Although there have been some notable local improvements -- largely due to combined industrial and municipal source cleanup -- the municipal sewage treatment program has not yet accomplished much nationwide. Less than 10% of the projects funded actually are complete and contributing to water quality improvement. In terms of the municipal sources which this program addresses, EPA Administrator Costle stated in late 1979, "For every Federal dollar that is already at work cleaning up our water, another $11 have been invested in the construction of plants that have yet to process a single kilogram of wastewater."

While $56 billion is EPA's most recent estimated "need" for constructing secondary and higher-than-secondary treatment facilities, that is not the full picture. Other categories of "need" for meeting all of the Act's requirements raise the total to an estimated $233 billion and include elements such as rehabilitation of old sewer lines, treatment of combined sewer overflows, and control of separate stormwater flows. (The category of separate stormwater sewers -- although it continues to be included in EPA's needs assessment -- has not been eligible for Federal funding under the Act since 1977.) Past eliminates of nationwide needs have been as high as $500 billion. Public spending of the magnitude potentially required for municipal needs represents substantial demand on the Federal budget, at a time of severe overall pressure on the budget.

President Carter had been on record as being committed to spending $45 billion for wastewater treatment projects over the 10 years from 1978 to 1987. Over the remainder of this period, appropriations would have to average $4.7 billion annually in order to meet that commitment. However, during recent consideration of 1981 amendments to the Act, P.L. 97-117, Reagan Administration spokesmen talked about limiting Federal assistance to $2.4 billion annually for the next 10 years and ending Federal involvement thereafter.

However, inflation rates in the construction industry are averaging 12% and for some time have been nearly that high in the economy as a whole, as measured by other economic indicators. Inflationary pressures result in a given number of dollars buying less and less pollution abatement. EPA has said that the added effects of inflation recently have consumed the entire annual appropriation, leaving virtually no residual funds to reduce needs on

a net basis. At current rates of appropriations and inflation, municip treatment needs to comply with the statute never will be fully met, accordin to EPA. Even with zero inflation and no changes in rules or performance requirements, some states estimate that at current authorized funding levels, it would take 20 years to complete the mandated cleanup process.

Closely related to concerns about funding new construction is the fact that EPA's own data indicate that as many as 50% of the Nation's wastewater treatment facilities fail to operate properly, due to factors such as improper system design and installation, poor operator training, and inability in some cases to attract qualified personnel. There is no effective inspection system, either Federal or State, reviewing the construction or operation of these systems. The GAO recently reported that 87% of the plants investigated in a random sample in 10 States were violating their discharge permits. In GAO's view, 31% were in serious violation. These problems have led some persons to question the value of investments already made in operating units. Another area of concern examined by GAO is user fees, with which municipalities are supposed to support ongoing operation and maintenance, as well as future equipment replacement. Based on surveys of municipalities in 10 States, GAO reported that most municipalities are not charging adequate user fees to cover both current and future costs. The result, according to GAO, is that some users are receiving a subsidy, while the systems are unable to maintain financial integrity and self-sufficiency.

Moreover, Federal expenditures under the construction grants program do not reduce the degrading impact of urban and rural stormwater runoff. These and other so-called nonpoint sources of water pollution are estimated to be 50% or more of total pollutant loads of lakes and streams. Estimates of the cost of abating nonpoint pollution are rough; for urban runoff alone, estimates range from $70 billion to $500 billion. The Clean Water Act provides for local, State, or regional planning and implementation of measures to control nonpoint sources. The Act does not authorize direct expenditures to abate those types of problems, however, as it does for municipal point source wastes. Thus, it is unlikely that all of the goals of the Act can be achieved solely by present pollution control requirements affecting industries and municipalities and at the present level of Federal funding.

The municipal construction grants program represents by far the largest Federal expenditure under this Act and, in fact, totals 74% of EPA's budget ($3.3 billion out of $4.75 billion in FY81 under P.L. 96-526). Yet it is clear that the program is not working well: Federal and State program management have been widely criticized, while inflation consumes a larger portion of the annual appropriation, and estimated municipal needs are not decreasing. The water quality goals of the Act are far from being achieved, and some persons are concerned that the failures of the municipal program may wipe out other achievements of the entire clean water effort. Anticipating reauthorization of the Clean Water Act, early in 1980 EPA began a policy assessment called the 1990 Strategy, intended to recommend legislative and administrative options for improving the grants program, achieving cost-effective water cleanup, and maximizing progress towards the Act's goals. In view of current fiscal pressures on this and other programs supported by government, Congress may choose to reexamine the municipal grants program and ask what should be done. In doing so, it might consider various options, including continuing the program as is, seeking new technological solutions to wastewater problems, stretching out the program's deadlines in order to improve technical understanding of the causes and

One issue of growing concern is the financial impact of the grants program on State and local governments. The 75% Federal funding available since 1972 has been a substantial inducement to many communities. A number of them have begun to conclude, however, that the costs of operating and maintaining (O&M) new facilities may represent 65-70% of total costs, placing a harsh and often unanticipated burden on local citizens. This is a particular problem with the sophisticated AWT systems designed to meet more stringent water quality requirements.

There have been proposals to provide Federal funds for O&M costs. EPA has taken the position that under the Act O&M costs are the community's responsibility and ordinarily are not a burden, compared with other municipal costs. Nevertheless, former Administrator Costle testified that EPA recognizes that these costs are increasing and in some cases the costs are quite high. Despite the concern that some communities may need aid, it is feared that making Federal funds available for O&M expenses would become a perpetual drain on the Federal budget. In view of current economic conditions and Federal budget-cutting efforts, that prospect pleases few persons.

Sewage treatment systems may also impose direct expenses on local citizens through the fees for hooking up a residence to new sewer lines. Such fees or charges can amount to hundreds of dollars. At present, Federal funding cannot be used to pay for these interconnection fees.

LEGISLATION IN THE 96TH CONGRESS

1. Repeal of industrial cost recovery. In October 1980 Congress enacted legislation that repealed the industrial cost recovery (ICR) provision of the Act (P.L. 96-483). The 1972 FWPCA included the ICR provision to assure that industries discharging effluents into municipal treatment plants repaid their proportionate share of the Federal construction cost of treating industrial wastes. However, industrial users and some municipalities criticized the ICR program as being unduly burdensome. As a result, the 1977 Amendments modified the ICR provision, called for a study of the program, and imposed an 18-month moratorium on collecting ICR charges. In December 1979 Congress agreed to legislation to extend the moratorium until June 30, 1980 (P.L. 96-148). Subsequently, however, Congress passed the legislation entirely repealing the ICR provison. P.L. 96-483 also terminated Federal grant assistance for treatment of industrial discharges after Nov. 15, 1981, and required an EPA study of the effect of this action This particular restriction, which was an amendment by Senator Stafford, has been termed the Industrial Cost Exclusion (ICE) provision. The EPA report was submitted to Congress March 15.

P.L. 96-483 reauthorized through FY82 several sections of the Act that expired in FY80, including grants to States to administer water pollution programs and to conduct areawide waste management planning. This law also authorized $20 million in construction grant monies to clean up PCB pollution in the Hudson River. Finally, P.L. 96-483 extended the allotment period for FY79 grant funds for an additional year.

2. Deferral of FY80 funds. In an effort to balance the overall Federal deal budget, in April 1980 the Carter Administration proposed a budget

MAJOR ISSUES SYSTEM

DATE ORIGINATED 08/21/79
DATE UPDATED 11/29/82

For the last three years Congress has voted not to fund the program at the level requested by the Administration. In the FY81 appropriations measure (P.L. 96-526), Congress appropriated $3.3 billion for construction grants; this was $400 million less than the requested amount. As of February 1981 the program had an unobligated balance of $5.3 billion -- that is, monies appropriated but not yet committed to be spent for specific projects. Yet by July 1981 the unobligated balance had been reduced to $2 billion, as a result of actual obligations and particularly as a result of congressional rescission of $1.7 billion in unspent monies in P.L. 97-12.

Early in 1981 the Reagan Administration examined the grants program and offered legislative proposals intended to reduce the Federal Government's long-term commitment to building municipal sewage treatment plants, as well as to focus the program on solving the Nation's most serious existing water quality problems. These and other proposals for revising the grants program are discussed below.

Recent legislative concern has focused on particular aspects of the program. One concern centered on the allotment process, which gives States 24 months to obligate construction money before reallotment of unspent funds occurs automatically. It has been argued that some States, facing that deadline pressure, probably would choose to fund low-priority projects to avoid losing their allotment, a situation that would undercut the goals of the Clean Water Act, according to EPA. There is little evidence to substantiate this concern firmly, however. By the end of FY79 all States except Ohio were able to obligate their remaining funds; Ohio lost $39 million through reallotment at that time.

Industries and municipalities frequently have argued that the costs of achieving more stringent levels of water pollution control, particularly the requirements for using BAT, greatly exceed the water quality benefits that will be derived. Similar questions also have arisen about the costs associated with the municipal construction grant program. EPA's most recent survey of the nationwide cost of compliance with the Act identified $120 billion in funding "needs" to construct municipal treatment works in the U.S. Because of the Federal funds going into those grants, some persons question whether it is cost-effective to invest in sewage treatment facilities capable of achieving treatment performance more stringent than secondary levels, or what is termed advanced wastewater treatment (AWT). It is argued that in many cases costly AWT plants are being built while small incremental water quality benefits are realized, particularly in view of the larger nonpoint source pollution problems which remain. The General Accounting Office has issued reports criticizing AWT requirements and urging greater flexibility in the law in order to match treatment and water quality needs.

Partly in response to congressional criticism, EPA now is performing a two-level review for project applications in connection with the Act's 1983 municipal requirements: Those involving AWT, using high technology and highly capital and energy-intensive processes, or those based on advanced secondary treatment (AST), falling between secondary and AWT and thus having smaller incremental costs than AWT. This represents an effort to identify projects where protection of water quality truly justifies building more costly plants. EPA's 1980 survey of wastewater treatment facility needs estimated that 12% of projects will require AST, while 3% will require full AWT to be in compliance with the Act. By the end of FY79, EPA headquarters had completed review of 38 advanced treatment projects and estimated that $35 million in construction costs had been saved as a result. EPA regional offices had reviewed 169 additional projects where construction cost savings

CLEAN WATER ACT: CURRENT ISSUES AND ADMINISTRATION PROPOSALS

MINI BRIEF NUMBER MB82205

AUTHOR:

Claudia Copeland

Environment and Natural Resources Policy Division

THE LIBRARY OF CONGRESS

CONGRESSIONAL RESEARCH SERVICE

MAJOR ISSUES SYSTEM

DATE ORIGINATED 02/11/82
DATE UPDATED 11/29/82

2. Technological requirements/BAT. The Clean Water Act established two specific pollution cleanup deadlines for industry and municipalities. It required industry to achieve so-called Best Practicable Treatment Technology (BPT) by mid-1977 and more stringent Best Available Technology (BAT) by mid-1984. As a result of a 1976 consent decree and 1977 amendments to the law, a key focus of the BAT standards will be limiting toxic waste discharges. Because EPA has not yet issued the specific BAT discharge limits -- making it very difficult for industries to install necessary treatment technology by mid-1984 -- a number of them already have proposed extending that deadline until 1987 or 1988.

A more difficult issue related to BAT requirements is whether the more stringent control technology is needed uniformly throughout the Nation or whether some modification would be desirable. It is pointed out, for example, that studies performed by EPA, industry, and municipalities have determined that BPT technology does a better job than had been anticipated in removing many toxic materials. Thus, in some cases, BPT alone may achieve levels of treatment adequate to meet applicable water quality standards. Studies do indicate, however, that BPT alone is less successful in removing certain toxics, including such heavy metals as cadmium. Critics of the current uniform BAT approach contend that it amounts to "treatment for treatment's sake," particularly in view of the cost of achieving more stringent discharge limits, and that it should only be applied where it is necessary for water quality purposes. Moreover, research has found that some industries do not discharge the toxic substances regulated by EPA under the BAT program or discharge certain toxic wastes only in trace amounts, leading to a view that BAT is unnecessary to control discharges from those industries.

Based on some of these concerns, a number of industries have urged EPA to seek legislative change that would permit waivers from BAT requirements for toxic pollutants. Current law prohibits EPA from allowing waivers or variances for toxics.

Proponents of retaining the law's uniform BAT requirements argue that, despite the apparent success of BPT in removing many toxic wastes, BAT should be applied as insurance for remaining toxic materials, including any that might be discharged by a plant in the future as a result of manufacturing process change. Moreover, these persons argue, if, by modifying BAT requirements, discharges of toxics in trace amounts occurred, that would be contrary to the Act's philosophy that no one has an inherent right to pollute, especially where technological controls are available. Uniform technological standards also have been supported because they tend to promote economic equity among companies within a particular industry category and because they may foster development of new technologies.

Administration proposal (sec. 2 of S. 2652, H.R. 6670). This section extends the current deadline for industrial compliance with BAT and best conventional technology (BCT) effluent guidelines from July 1, 1984, to July 1, 1988. It also extends until July 1, 1991, the present 3-year deadline extension for dischargers using innovative technologies to achieve BAT.

Although many industry groups had pressed the Administration to seek BAT and BCT waiver authority, the proposed amendments do not contain such a revision. It its analysis of the legislation, EPA stated that establishment of a waiver system would be "premature," since the majority of BAT and BCT

POOLESVILLE SEWERAGE FACILITIES PLAN

C-240479-01

COMMENTS AND QUESTIONS
REGARDING PROPOSED
POOLESVILLE SEWERAGE FACILITIES

June 30, 1982

Prepared by

Lawrence A. Salomone
19108 Hempstone Avenue
Poolesville, Md. 20837

20-955 O—84——97

SUMMARY OF FINDINGS

POOLESVILLE SEWER AND WATER USER CHARGE COULD INCREASE FROM $2.75 TO OVER $8.50

CAUSE:

1) Construction of a new Poolesville Wastewater Treatment Plant
2) Upgrading and Rehabilitation of Existing Sewer Collection System

PRIMARY PURPOSE OF CAPITAL IMPROVEMENTS:

To provide for residential and commercial development projected in Poolesville Master Plan [1].

APPROACH:

Important issues in Sewerage Facilities Plan need clarification [1]. Extensive inflow/infiltration into existing collection system may cause design problems. User fee may increase greatly [1].

ENVIRONMENTAL IMPACT OF EXISTING TREATMENT PLANT:

Water Quality Data collected by the Montgomery County Dept. of Environmental Protection indicate effluent being discharged into Dry Seneca Creek by the Poolesville treatment plant is not a health hazard nor a cause of water quality problems nor a threat to the drinking water supply for Washington, D.C. [4].

COST OF CAPITAL IMPROVEMENTS REQUIRED FOR RESIDENTIAL AND COMMERCIAL DEVELOPMENT:

The Town of Poolesville currently has a combined water and sewer rate of $2.75 per 1000 gallons of metered water. This user rate could become $8.50 per 1000 gallons of metered water as shown below:

Item	Current System Poolesville User Cost per 1000 gal. of Metered Water (1)	Expanded System Projected Poolesville User Cost per 1000 gal. of Metered Water (2)	Current WSSC User Cost per 1000 gal. of Metered Water (3)
Water System	$2.27	$4.54*	$ .82
Wastewater Treatment Plant and Collection System	$ .48	$3.96	$1.62
Combined Water and Sewer Cost Rate	$2.75	$8.50	$2.44

* Doubling the capacity of the water supply system could result in a user cost that is twice the current Poolesville user cost. This estimate should be verified by the Commissioners of Poolesville.

1. INTRODUCTION

1.1 GENERAL (Excerpted from [1]*)

Since 1964, the town of Poolesville has operated its own wastewater collection and treatment system which is completely independent of the WSSC. (The WSSC serves other communities in Montgomery County.) Consequently, on August 20, 1976 the State of Maryland initiated a moratorium on new building permits and sewer service authorizations because residential development was proceeding too rapidly and a condition of inadequate treatment of wastewater at the Poolesville plant existed. In October of 1980, the Commissioners of Poolesville adopted a revised Master Plan which recommended that immediate improvements be made to the sewerage system to support an interim population of 5,800, with further improvements to support an ultimate town population of 7490 to be made at some unspecified time in the future. The town of Poolesville has received a combined step 2-3 Construction Grant to cover the Federal and State share of costs associated with design and construction of the required sewerage treatment plant.

1.2 PURPOSE

Information regarding the need, approach and costs for the proposed sewerage treatment plant and rehabilitation of the existing collection system has been difficult to obtain. Transcripts of public hearings held to discuss the proposed sewerage treatment plant and the town budget show that the concerns of all the residents present were not adequately addressed or their questions completely answered [2]. Also, information in the local newspapers has been incomplete. As a result most Poolesville residents are not aware of the risks and changes in the water and sewer user cost rate associated with the proposed sewerage treatment plant and collection system. Figure 1-1a provides a local paper's editorial dated June 17, 1982, regarding the proposed sewerage treatment plant. The letter to the editor written to provide the readers of the local paper the complete cost information which was published on June 24, 1982 is shown in Figure 1-1b.

The purpose of this document is to provide the Commissioners of Poolesville comments and questions regarding the proposed treatment plant and collection system and allow one month from receipt of this document (July 30, 1982) for a response. In this way more time will be available for a response than is generally available during a public hearing.

1.3 SCOPE

To accomplish the purpose stated in Section 1.2, information was obtained from the following sources:

---

* Numbers in brackets refer to references presented at the end of this document.

Figure 1-1a. Editorial from Local Paper

Hurray for Poolesville

The Commissioners of Poolesville are to be congratulated for getting the taxpayers of Maryland as well as of the country at large to finance the overwhelming majority of the town's new water treatment and sewage systems. The result is that tax rates will remain unchanged in spite of the $418,000 capital improvements budget.

The $418,000 may sound like peanuts to the Montgomery County Council in Rockville, but it is an awful lot of money in Poolesville.

With the local commissioners managing to do their work without raising sewer fees, water fees, or property taxes, we would suggest that they might have much to teach, while the county council might have much to learn.

Figure 1-1b. Letter to the Editor to Provide Complete Cost Information

Poolesville capital improvements

In the June 17, 1982 issue, it is stated that "the Commissioners of Poolesville are to be congratulated for getting the taxpayers of Maryland as well as of the country at large to finance the overwhelming majority of the town's new water treatment and sewage systems" ("Gazette" editorial). The information in the Kamber Engineering, Inc. report which is entitled "Final Sewerage Facilities Plan, Supplement For Poolesville and Vicinity" and received by the Dept. of Environmental Protection on Aug. 6, 1981 does not support the statement that the overwhelming majority of the town's new water treatment and sewerage systems will be paid for by the Maryland taxpayers and the country at large. The present Poolesville residents appear to be assuming the risk (technical and management) and financial burdens for the new water treatment and sewerage systems.

The Kamber Engineering, Inc. report (Table 4.1, pg. 4-2) provides the following summary of costs for the selected plan:

Item	Total Costs	Est. Fed. & State Grant	Est. Local Share
SBAST Treatment Plant	$2,118,700	$1,810,550	$382,050
Collection System	$2,447,000	$393,750	$2,053,250

This cost information shows that the Poolesville residents will be assuming over 50 percent of the total capital costs for this project. Furthermore, the report states that the user cost to the present Poolesville residents will be $2.27 for the new treatment plant and collection system. Poolesville residents now pay a user cost of $2.75 for both water and sewer services. Based on the costs provided by Kamber Engineering Inc., the new user rate after the treatment plant and collection system is installed is expected to be over $4.50. These cost figures suggest that, unlike other small towns in the United States, the present residents of Poolesville will pay for the major capital improvements required for residential and commercial development in the Poolesville area.

Addressing the question of risk to the present Poolesville residents, consider the following statement taken from a report by the U.S. General Accounting Office (CED-81-94) dated June 15, 1981. The Environmental Protection Agency states that "the municipality that accepts a construction grant is responsible for the administration and successful accomplishment of the project." The method of treatment selected for the town's new water treatment plant has only been used at the demonstration facility at Culver, Ind.

If there are any difficulties associated with implementing this innovative technology or if there are any increases in cost, the present Poolesville residents will assume the responsibility for "successful accomplishment of the project."

I commend "The Gazette" for publishing this letter and informing its readers of the published costs and risks associated with the new treatment plant and collection system planned for Poolesville.

Lawrence A. Salomone
Poolesville

a) The office of Congressman Michael Barnes, the Montgomery County Office of Environmental and Energy Planning, the Montgomery County Division of Pollution Control and the General Accounting Office.

b) Telephone conversations with federal, state and county officials familiar with the proposed Poolesville sewerage facilities treatment plan and

c) References cited in the Appendix.

A review of the available information was made and this document prepared which provides comments and questions regarding the proposed sewerage treatment plant and collection system. The concerns and questions can be divided into the following categories:

a) Need
b) Approach
c) Cost and
d) Management of Proposed Project

Using this breakdown the comments and questions for each category will now be presented.

2. NEED

2.1 COMMENTS

Kamber Engineering, Inc. [3] states that "failure (of the existing Poolesville treatment plant) to meet the effluent discharge limitations and overflows are a potential health hazard, and are a cause of water quality problems. The treatment plant discharges to Dry Seneca Creek and hence to the Potomac River which is a source of drinking water supply for Washington, D.C." Water Quality data collected by the Montgomery County Department of Environmental Protection do not support this conclusion [4]. Examination of this water quality data obtained from monitoring stations upstream and downstream from the Poolesville Sewerage Treatment Plant, PSTP (see Figure 2-1 for locations) reveal:

a) The water quality of Dry Seneca Creek is rated PERMISSIBLE using the Water Quality Index (WQI) developed by Brown, McClelland, et al of the National Sanitation Foundation [4]. The Water Quality Index is used to describe the average water quality of each of the County's streams. Table 2-1 provides a summary of stream water quality for Dry Seneca Creek and the WQI for 1978 through 1980. Comparison of the indicators used to evaluate water quality with the criteria established by the Maryland Water Resources Administration's Water Pollution Regulations 08.05.04.01 though 08.05.04.12 shows that the average water quality is acceptable (see table 2-1).

b) The water quality of Dry Seneca Creek is not significantly affected by the effluent being discharged by the existing Poolesville treatment plant (see Table 2-2). The data from upstream and downstream monitoring stations show that the river using natural processes is able to minimize the effect of effluent being discharged by the existing Poolesville treatment plant so that its water quality is not significantly affected. An evaluation made by the Maryland Dept. of Health and Mental Hygiene confirms this conclusion [5].

c) The geometric mean total coliform density (MPN/100 ml) and geometric mean fecal coliform density (MPN/100 ml) are higher upstream (station 20040) and downstream at Montevedio Rd. (Station 20020) than at the downstream monitoring station (Station 20030) close to the existing Poolesville treatment plant (Table 2-2). Monthly water quality data [4] also show that at times there is poorer quality water upstream and further downstream than at the downstream location close to the existing Poolesville sewerage treatment plant. Construction of a new Poolesville sewerage treatment plant would not be expected to reduce the effect of the sources of pollution upstream from Poolesville. If the regulatory agencies want to change the WQI for Dry Seneca Creek from PERMISSIBLE to GOOD a regional approach will be required.

The water quality data collected by the Montgomery County Department of Environmental Protection indicates that Poolesville's failure to meet the effluent discharge limitations is not a health hazard, a cause of water quality problems nor a threat to the drinking water supply for Washington, D.C. Therefore, the purpose and need statement in the Kamber Engineering Report [3] for the proposed treatment plant should be changed to read "A new treatment plant and rehabilitation collection system is required in Poolesville to aid in

removing the state of Maryland moratorium for Poolesville (referred to in Section 1.1), to allow residential and commercial development for the Poolesville area and to meet effluent discharge standards determined by law.

2.2 QUESTIONS

Based on Section 2.1, the following information is requested from the Commissioners of Poolesville:

1) Provide the water quality data that documents the environmental need for the proposed Poolesville Sewerage Treatment Plant.

2) Present EPA regulations do not allow funding for sewerage treatment plants that are required primarily for residential and commercial development. Why then was a combined step 2-3 construction Grant awarded to the Town of Poolesville?

3. APPROACH

3.1 COMMENTS

The cost information for the SBAST Treatment System and Collection System provided in the Kamber Engineering Inc. report [3] (figure 1-1) and in Reference [1] shows that at least 50 percent of the cost for this 4.5 million dollar project will be assumed by the present residents of Poolesville. It should be emphasized that 84 percent of the rehabilitation and upgrading of the existing collection system for development purposes will be paid for by the Poolesville residents, i.e., $2,053,250.

Unlike other small towns in the United States, the present residents of Poolesville, Maryland taxpayers, and the country at large will pay for the major capital improvements required for residential and commercial development in the Poolesville area. The Upper Bear Creek Metropolitan District, (UBCMD) serving an area near Evergreen Colorado, provides an arrangement for major capital improvements required for development which can serve as a model for Poolesville, MD.

Developers of a new subdivision, Troutdale Village, will construct and pay for the water and sewer lines required for Troutdale. After water and sewer lines have been built to serve the Troutdale development, the lines will be deeded to the District and the purchasers of homes in the Troutdale subdivision will be subject to taxes for the obligations of the Sanitation District to pay for sewer bonds. They will pay for water use through monthly service charges. Present residents in the rest of the District will pay NOTHING for the service for Troutdale.

Another concern regarding the approach chosen by the Commissioners of Poolesville and Kamber Engineering, Inc. involves the following statement from Reference [3], "The submittal of the final Sewer System Evaluation Survey (SSES) Report, which will identify the extent of the Infiltration/Inflow (I/I) problem and recommend corrective action, will be separate from the remainder of the Facilities Plan in order to avoid delay in implementation of badly needed treatment improvements." This statement suggests that the sewerage treatment facilities could be designed and constructed before the existing collection system is completely rehabilitated and the plant will be built based on an assumed I/I flow of 150,000 gallons per day [1, 3].

I/I reductions of up to 80 percent will be necessary to reach the 150,000 gpd I/I flow figure used for planning the facilities [1]. Considering that previous attempts to rehabilitate the collection system had no recognizable effect [3] on reducing I/I flows which average (monthly) at 230,000 gpd, with a peak of 709,000 gpd [1], inability to achieve the assumed level of reduction could lead to a reduction in the capability of the plant to treat planned domestic waste flows [1]. This would reduce the number of potential users thereby increasing the user fee that is now projected.

Considering that even under the best conditions 25 percent of the waste flow at the new facility will be contributed by I/I [1] and the I/I now experienced in

the existing system, significant quantities of grit may reach the plant thereby affecting its performance and increasing the user cost to the residents of Poolesville.

3.2 QUESTIONS

Based on section 3.1, the following information is requested from the Commissioners of Poolesville:

1) Why not ask those developers, who a Commissioner said are interested in developing further the Poolesville area [6], to assume the responsibility for the major capital improvements required a) to remove the Poolesville moratorium on new building permits and sewer service authorizations? and b) for residential and commercial development? Using this approach the expertise and experience of the development companies can be used to ensure the successful accomplishment of the project.

2a) Provide schedule for implementation of the selected plan for the proposed treatment plan and rehabilitation of the existing treatment plan.

2b) Discuss contingency plans if delays are caused by regulatory reviews, difficulties in reducing I/I flow to 150,000 gpd, and financial, legal, political and environmental factors.

3) What measures will be taken to prevent the proposed treatment plant being designed and constructed based on a maximum I/I flow which cannot be achieved by the rehabilitation work on the existing collection system?

4. COST

4.1 COMMENTS

The user fee resulting from additional residential and commercial development in the Poolesville will be determined by:

a) Combined water and sewer rate existing when major capital improvements required to remove the moratorium initiated by the Sate of Maryland are completed.

b) User charge associated with debt service and Operations and Maintenance (O&M) for the planned wastewater facility for present flow conditions.

c) Cost of intensive sewer rehabilitation required to achieve I/I flow used for design of proposed treatment plant.

d) Additional costs resulting from conditions not accounted for in the estimated costs.

e) The debt service and O&M costs associated with drinking water supplies required to remove the moratorium and serve a population capacity equal to that of the proposed treatment plant. Note that the planned development cannot occur until this cost is reflected in the user fee. Without adequate water supplies, the present Poolesville residents will be paying for a treatment plant and collection system that is designed for a population that is approximately twice the 1982 population of 3000 and a population that is expected by the year 2003. Considering that Poolesville residents frequently face water shortages and that no extensive or highly productive aquifers exist in Montgomery Country [4], further attempts to increase the Poolesville water supply should prove costly.

The Town of Poolesville currently has a combined water and sewer rate of $2.75 per 1000 gallons of metered water (Item "a" above). This fee includes debt service for the old wastewater plant and new town wells, along with the associated operations and maintenance costs [1]. It should also be pointed out that the present user fee of $2.75 is subsidized by general tax funds to the extent that the user fee would be over $5.00 if this was not done [7]. By accepting federal and state grants for the proposed project, this practice will no longer be allowed. Consequently the actual cost for water and sewer services will be reflected in the user fee. The Facility Plan estimates that the user charge for the present residents associated with the debt service and O&M for the planned wastewater facility will be $2.27 (Item "b" above). Using Kamber Engineering Inc.'s cost figures and assumptions from Reference [3], the user charge for the entire system (Items "b" plus "c" above) is $3.96. Therefore, the impact of the proposed sewerage treatment plant and rehabilitation/upgrading of the existing collection system on the Poolesville user cost rate can be seen in Table 4-1. Also, the current WSSC user cost rates are shown for comparison purposes.

Table 4-1. User Cost for Sewerage Facilities

Item	Current System: Poolesville User Cost per 1000 gal. of Metered Water (1)	Poolesville User Cost per 1000 gal. to Expand System (2)	Expanded System: Projected Poolesville User Cost per 1000 gal. of Metered Water (3)	Current WSSC User Cost per 1000 gal. of Metered Water (4)
Water System	$2.27	Item "e"	$2.27 + Item "e"	$ .82
Wastewater Treatment Plant and Collection System	$ .48	$3.96	$3.96	$1.62
Combined Water and Sewer Cost Rate	$2.75		$6.23 + Item "e"	$2.44

If a user fee is determined based on items "a" through "e" above, it is easy to see that the cost to the Poolesville residents that will result from the planned capital improvements being proposed for residential and commercial development will be even more prohibitive--the final user fee could very easily exceed the maximum allowed by Federal law based on a percentage of the mean annual salary of the present Poolesville residents.

4.2 QUESTIONS

Based on section 4.1 the following information is requested from the Commissioners of Poolesville:

1) Provide the final user fee expected after all the capital improvements necessary for additional residential and commercial development have been completed. The final user fee should reflect the cost items a through e listed in section 4.1 and any additional cost items deemed appropriate.

2) Provide the breakdown and assumptions for each cost item that determined the final expected user fee.

3) Provide an evaluation of the cost of intensive sewer rehabilitation as it relates to the benefit provided residents of Poolesville who are or will ultimately be using the system.

5. MANAGEMENT OF PROPOSED PROJECT

5.1 COMMENTS

In a public hearing in 1981 a Commissioner of Poolesville stated that the federal government (EPA) will assume the responsibility that the innovative technology being planned for the proposed treatment plant will be effective in meeting the sewerage treatment needs of the Town of Poolesville. The following statement from Reference [8] suggests that this statement is not correct. The Environmental Protection Agency states that "the municipality that accepts a construction grant is responsible for the administration and successful accomplishment of the project." Therefore if there are any difficulties associated with implementing this innovative technology or if there are any increases in cost, the present Poolesville residents will assume the responsibility for "successful accomplishment of the proposed project."

The Town of Poolesville is a small town. The majority of the 5 Poolesville commissioners are people who have full time private occupations and serve the Town in addition to carrying on their private businesses. None of them are engineers and none of them have any special knowledge of the technical aspects of sewerage treatment. Consequently it is not realistic to expect that they will be able to assume the responsibility for the administration and successful accomplishment of the proposed project. Previous attempts by the Town of Poolesville to manage capital improvement projects have been unsuccessful. Present residents are now paying for a judgment against the Town of Poolesville resulting from a suit filed by a developer involved in development in the Poolesville area prior to 1976. Also, the Town of Poolesville is operating a park, that it constructed, despite the fact that Montgomery County refused to sanction the park for County activities because it fails to meet the County code for recreational areas of this type.

The Town of Poolesville is an "island" in a sea of farmland and 5 acre zoning requirements, but no town can afford to be an island when it involves constructing and operating water and sewer systems that meet present federal and state standards. It is not feasible to think that Poolesville residents (even if the town grows to 5800 people) will ever be able to afford the user cost associated with their own water and sewer system if existing regulations are to be followed. Montgomery County (and the WSSC) should be allowed to provide the long-term solution to this problem. The proposed facilities plan will not meet the ultimate needs of present and future Poolesville residents. There are too many issues in the Facilities Plan which need further clarification.

5.2 QUESTIONS

Based on section 5.1, the following information is requested from the Commissioners of Poolesville:

What steps are being taken to ensure the successful accomplishment of the proposed project?

6. SUMMARY

Based on the available data (sources indicated in appendix), the following additional information is requested from the Commissioners of Poolesville:

NEED

1) Provide the water quality data that documents the environmental need for the proposed Poolesville Sewerage Treatment Plant.

2) Present EPA regulations do not allow funding for sewerage treatment plants that are required primarily for residential and commercial development. Why then was a combined step 2-3 Construction Grant awarded to the town of Poolesville?

APPROACH

1) Why not asked those developers, who a Commissioner said are interested in developing further the Poolesville area [6], to assume the responsibility for the major capital improvements required a) to remove the Poolesville moratorium on new building permits and sewer service authorizations and b) for residential and commercial development? Using this approach the expertise and experience of the development companies can be used to ensure the successful accomplishment of the project.

2a) Provide schedule for implementation of the selected plan for the proposed treatment plan and rehabilitation of the existing treatment plan.

2b) Discuss contingency plans if delays are caused by regulatory reviews, difficulties in reducing I/I flow to 150,000 gpd, and financial, legal, political and environmental factors.

3) What measures will be taken to prevent the proposed treatment plant being designed and constructed based on a maximum I/I flow which cannot be achieved by the rehabilitation work on the existing collection system?

COST

1) Provide the final user fee expected after all the capital improvements necessary for additional residential and commercial development have been completed. The final user fee should reflect the cost items a through e listed in section 4.1 and any additional cost items deemed appropriate.

2) Provide the breakdown and assumptions for each cost item that determined the final expected user fee.

3) Provide an evaluation of the cost of intensive sewer rehabilitation as it relates to the benefit provided residents of Poolesville who are or will ultimately be using the system.

MANAGEMENT OF PROPOSED PROJECT

1) What steps are being taken to ensure the successful accomplishment of the proposed project?

7. CONCLUSIONS

The available information (see appendix for sources) suggests:

1) The ability of the existing treatment plant to meet current effluent requirements is significantly affected by excessive I/I which presently accounts for better than 60 percent of the flow to the treatment plant during wet weather conditions. By reducing I/I to an acceptable limit through rehabilitation work on the existing collection system, the frequency of non-compliance for the existing Poolesville Sewerage Treatment Plant will be reduced.

2) Despite the "poor" quality of the Poolesville effluent being discharged into Dry Seneca Creek, the effect on the water quality of Dry Seneca Creek appears to be minimal based on water quality data in reference [4].

3) Poolesville's failure to meet the effluent discharge limitations is not a health hazard, a cause of water quality problems nor a threat to the drinking water supply for Washington, D.C. Therefore, the primary purpose and need for the proposed treatment plant appears to be to achieve the residential and commercial development projected in the Poolesville Master Plan.

4) Arrangements should be made with those developers interested in the Poolesville area to assume the responsibility for the capital improvements required for residential and commercial development. Using this approach the expertise and experience of the development companies can be used to ensure the successful accomplishment of the proposed project.

5) The rehabilitation of the existing collection system should be completed before the treatment plant is constructed to establish the actual I/I rate for design purposes. Otherwise, a reduction in the capability of the plant to treat planned domestic waste flows would be expected.

6a) The impact of the proposed treatment plant and rehabilitation/upgrading of the existing collection system on the Poolesville user cost rate is significant (see table 4.1).

6b) The final user charge expected after all the capital improvements necessary for additional residential and commercial development (items a thru e in section 4.1) should be determined by the Commissioners of Poolesville and provided to the appropriate local, state and federal agencies to ensure that existing regulations are met with respect to costs. Note that a SBAST treatment plant proposed for Jonesville/Jerusalem is not being built because of the high user cost.

7) Montgomery County (and the WSSC) should be allowed to provide the facilities required to meet the Poolesville water and sewer needs if deemed necessary. The available water quality data [4] indicates that a regional solution will be the most effective and no small town will bear the long-term

20-955 O—84——98

financial burdens associated with maintaining its own water supply and sewer system.

Finally, it is important to understand the basis for the effluent discharge standards set by law for the type of treatment plant presently serving the Town of Poolesville. The effluent discharge limitations of 30 mg/ℓ BOD_5 and 30 mg/ℓ suspended solids have been determined by law and not by the ability of the river to accept the effluent without any significant change in the river's water quality. Water quality data collected by the Montgomery County Department of Environmental Protection [4] indicate that the Poolesville Sewerage Treatment Plant effluent is not significantly affecting the water quality of Dry Seneca Creek. Therefore, there does not appear to be any environmental or health justification for the proposed long-term financial burden being considered for the current residents of Poolesville.

May 15, 1983

Mr. Charles Dempsey
Acting Inspector General (A-109)
U.S. E.P.A.
Office of the Inspector General for Audits
401 M St.,SW
Washington, D.C. 20460

Dear Mr. Dempsey:

We appreciated the opportunity on April 8,1983 to meet with Mr. R.W. Thieme, Mr. Dick Rodenhouse and Mr. Burt Anker of your staff and to discuss the Poolesville Sewerage Facilities Plan (Project C-240479-02).

Based on our discussion there appears to be legal, technical and economic grounds for withholding final approval of the Poolesville Construction Grant. Some of the pertinent issues include:

1. The environmental need for the proposed wastewater treatment plant is non-existent or very minor;

2. Present and future costs have been grossly underestimated;

3. A large imbalance between the high costs of the proposed plant and the minor environmental benefit exists;

4. Contrary to E.P.A. requirements,the proposed treatment plant is planned for construction before the major inflow and infiltration problem of the collection system is solved (1 million gallons per day during storms - three times the normal flows to the existing treatment plant);

5. With the environmental need for the proposed plant being non-existent or very minor, the Poolesville Construction Grant will be providing funds essentially for development and expansion purposes which is contrary to existing regulations;

6. The shortage of available potable water to meet the needs of the current residents suggests that our health and safety will be jeopardized further by construction of the proposed wastewater treatment plant with its demand for twice as much water as is currently available and

7. The selection of an activated sludge treatment proces is too sophisticated and too costly to operate and maintain for a small town like Poolesville, MD. Furthermore, existing regulations require the use of the present system,if possible, to meet the required effluent discharge limitations. Improvements to the existing lagoon to satisfy the required effluent discharge limitations were recommended by the previous engineering consultant to the Town of Poolesville.

Because of these issues, Poolesville residents are deeply concerned about proceeding with the proposed project. Enclosed is a

Citizen Petition that is signed by over five hundred (500) Poolesville residents opposing the E.P.A. Construction Grant for the new Poolesville wastewater treatment plant. This overwelming response is significant when one considers:

1. Eighty-five percent (85%) of the residents approached during a one week period signed the petition;

2. Poolesville, Md consists of approximately one thousand (1000) households and

3. Generally, town officials are elected with between 130 and 350 votes.

Poolesville residents are depending on the Office of the Inspector General to provide a timely, independent and objective review of the Poolesville Sewerage Facilities Plan and to have the authority to reach a decision that ensures their physical and economic welfare.

Sincerely,

Lawrence A. Salomone

DONALD H. NOREN
DIRECTOR

May 21, 1975

The Honorable Eugene E. Halmos, Jr.
President, Commissioners of Poolesville
P. O. Box 158
Poolesville, Maryland 20837

Dear Mr. Halmos:

This Department has conducted a thorough review of documentary material submitted by the Town of Poolesville, Montgomery County government, and other interested parties. It would appear that the dispute between the Town and the County is not directly concerned with present or potential health hazards, but rather with differences of local governmental opinion regarding inclusion of Poolesville's sewage treatment plant expansion in the County Comprehensive Ten Year Water and Sewerage Plan.

Whether or not the expansion of the Poolesville Sewage Treatment Plant should be included in the County Comprehensive Ten Year Water and Sewerage Plan appears more appropriately to be a key planning question. Since the inclusion or not of the Poolesville Sewage Treatment Plant in the said plan does not presently or perspectively pose a health hazard which would compel the Secretary of Health and Mental Hygiene to take action at this time, it does not appear that a revision of the County Plan by the Secretary to include the proposed expanded sewage treatment plant, as aforesaid, would be proper. Therefore, this office, with the concurrence of Dr. Neil Solomon, Secretary of Health and Mental Hygiene, will not order a revision of the County Plan to include the expansion of the Poolesville Sewage Treatment Plant.

If Poolesville and Montgomery County could reach an understanding on the rate at which development can take place in the Poolesville area, then the Town could simply make application to the Montgomery County Council for a change in the updated General County Plan.

Sincerely yours,

Donald H. Noren

RE: Poolesville, MD - Construction Grant
Project C-240479-02

Dear Mr. Dempsey:

This letter is in response to our telephone conversation on March 17,1983 and Mr. William M. Bulman's (of E.P.A. Region 3) letter to me dated March 15,1983. After reviewing Mr. Bulman's letter it is unfortunate that he has chosen to ignore the major discrepancies in the answers provided by E.P.A., the State of Maryland, the Town of Poolesville and their engineering consultant to my questions. Likewise, he has made it clear that he is not interested in the additional information that Poolesville residents have collected during the last nine months which shows that:

1. The environmental need for the Poolesville Sewerage Facilities Plan (specifically the proposed SBAST Treatment Plant) is non-existent or very minor,

2. The cost figures used to complete the financial capability tracking sheet do not agree with those figures in the transcripts from public testimony, and

3. Poolesville residents have not been given the full picture of the financial impact of implementing the Poolesville Sewerage Facilities Plan.

Appendix A provides a sample of the information that will be provided in a meeting as I discussed with Mr.E. Bradley and Mr. R.W. Thieme.

After my discussions with these members of your staff, I am encouraged that you will give us the opportunity to provide the results of our nine-month investigation to you and/or members of your staff in a meeting. The Poolesville homeowners,that I am writing for, are hopeful that you can provide an independent audit of the Poolesville project. Otherwise, we fear that Poolesville,MD will be added to the list of small towns that have received a Federal construction grant and now have defective sewerage treatment systems and long-range financial burdens.

As per my conversation with Mr. R.W. Thieme, I will expect to hear from you by March 25,1983.

Sincerely yours,
Lawrence A. Salomone
Lawrence A. Salomone

Appendix A

As a sample of one of the issues that will be discussed in a meeting consider the following: Mr. Bulman in his letter of March 15, 1983 states: "you again raised the issue of costs for the proposed system. Enclosed is a copy of our latest correspondence from the Town's engineers, dated December 1, 1982, which details the engineer's estimates for existing and future costs. We have reaffirmed these figures by telephone with the consultant as a result of your latest letter...We have no authority or responsibility in such a local matter as the current operation of the water and sewer funds. We are completely satisfied with the figures derived by the Town's consultant concerning estimates of future user costs..."

From these statements it is clear that Mr. Bulman does not recall that completion of the E.P.A. Financial Capability Tracking Sheet(that he requested from the Town's engineering consultant in his letter of October 25,1982) requires"a breakdown of the currently combined water and sewer charges nor realize that the numbers used to complete this E.P.A. form do not agree with public testimony and published information.

The Financial Capability Tracking Sheet is used to ensure that Federal guidelines are met with respect to the financial impact of the proposed wastewater treatment plant on Town residents. Based on the figures provided the total user charges after this project goes on line(per year) should not exceed(.0175 x $23,344) $408. It is therefore the E.P.A.'s responsibility to resolve the discrepancies in existing and future user costs shown in Tables 1 and 2 respectively and to ensure that the figures used are correct. With close to $2,000,000 of Federal money involved one might expect that the E.P.A. has authority and responsibilty in such a local matter as the current operation of the water and sewer funds.

Table 1
Existing User Cost
for Water and Sewer Systems

Source	User Cost per 1000gal.
Town's engineering consultant (Attachment 1)	$3.83 for FY 82
Town's Certified Public Accountant (Attachment 2)	$5.20 for FY 79
Town's water and sewer fund budget and published information (Attachment 3)	$6.22 for FY 82

Table 2
Future User Cost for Expanded
Sewer System

Source (1)	Increase to Annual Sewer Charge (2)	Total Sewer User Charge per year (projected from available data) (3)
Town's engineering consultant as seen in Attachment 1	$52	$250
Town's engineering consultant as stated in public hearing on August 10,1981 (Attachment 4)	$90 to $150	$412 to $472
Other small towns and available information	$200 to $500	$522 to $ 822

Despite the large discrepancies shown in Tables 1 and 2, Mr. Bulman chose to reaffirm the cost figures by telephoning the source of the information. As a professional engineer, I know that the best way to resolve significant discrepancies is to obtain information from more than one source. I believe that the information provided in Tables 1 and 2 serves as an independent check of the pertinent figures and indicates that an audit of the Poolesville project is warranted. Column 3 of Table 2 also shows that the financial impact of the Poolesville project exceeds federal guidelines ($408).

Finally, Attachment 1 indicates that the financial impact of the proposed wastewater treatment plant construction and the rehabilitation of the existing sewer system will be to increase the annual sewer user cost by $0.68 per 1000 gal. Does the E.P.A. really believe that a $4.5 million Sewerage Facilities Plan (that includes tertiary wastewater treatment for double the present Poolesville population) can be implemented in a town of about 1000 households at a user cost of $0.68 per 1000 gal.? Inflationary factors alone can cause a increase in the user cost of this order of magnitude.

Attn: Mr. William Bulman, Chief
Delaware/Maryland/Virginia/DC Branch

Re: 3WM20
Existing and Projected Sewerage System User Charges for the Town of Poolesville
Grant No. C-240479-02

Dear Mr. Bulman:

As per my December 1, 1982 telephone conversation with Andrew Uricheck, please find enclosed a revision of the November 9, 1982 Financial Capability Tracking Sheet for the referenced project. In reviewing this user fee analysis with the Town's accountant, an error in our computations was noted.

The November 9, 1982 letter stated that in order for the Town to recover the actual operating costs of both the water and sewer systems, during FY 82, a user fee of $3.29 per thousand gallons, or $2.22 per thousand gallons for sewer and $1.07 per thousand gallons for water would have been necessary. The corrected value is $3.83 per thousand gallons, or $2.59 per thousand gallons for sewer and $1.24 per thousand gallons for water. While the average household in Poolesville paid approximately $211 for water and sewer service last year (based upon an average daily consumption of 210 gpd and a user rate of $2.75 per thousand gallons), the actual cost of providing that service was $293.

A recomputation of the financial impact of the proposed wastewater treatment plant construction and the rehabilitation of the existing sewer system resulted in an increase of the annual sewer user costs by $0.68 per thousand gallons from $2.59 to $3.27 per thousand gallons. The projected total annual user cost after implementation of the project would now represent 1.07 percent of the median household income, or an increase of 0.22 percentage points.

We regret that our previous [illegible] and hope that this does not cause any [illegible] review [illegible]. Please let us know if you need any further [illegible] clarification.

Sincerely,

Dennis M. Kember, P.E.

In Re Public Hearing:

Proposed Water Rate Increase

The matter of a Public Hearing on Proposed Water Rate Increase came on for hearing on March 19, 1979, at 8:00 p.m., o'clock, when were present on behalf of the Commissioners:

APPEARANCES

Town Commissioners:

Charles W. Elgin, Sr., President
Philip G. Harris, Sr.
Mary Lu Moyer
Robert Rauch
Carl Alton Brown

Also Present:

Richard McKernon, Esquire
Nancy I. Fost - Town Clerk & Treasurer
Geanie Stokes, Secretary
Ted Mercer and Robert Fuhank, CPA's

an area that's being considered as a revision to provide the redress, okay. We don't have it. It's an oversight. But, these things take time, but we are in the process of trying. We've got a draft in circulation now amongst the Commissioners for their comments. When we have that finalized, we'll present it to the public for their comments. These sort of things will be coming up: we're trying to get them one at a time and we just -- just give us the benefit of the doubt. We're not up here doing nothing. We are working. So, just bear with us.

MR. SHARP: I appreciate that, but I was just curious to know what the -- system is.

MR. PRICE: I was just wondering what would the rate be, the proposed Budget if the water system paid for itself? ANSWER IS ON PGS. 70 & 71

PRESIDENT: You really want to know that? Mr. Eubanks, Mr. Mercer?

MR. MERCER: This year --- I'm going to have to figure. I'll get that information for you -- approximately three fifty to four dollars.

MR. RAUCH: It also depends upon how many capital improvements were scheduled in a given year.

MR. HARRIS: That's assuming that everybody maintained the same level too.

I don't think that there is any way to predict the

County paper, whatever. But, in addition, we did also send 70
out an individual letter to every ---

MR. SHARP: That wasn't my point of the question. The point of the question was, where I came from, you had to designate by referendum the official paper and I was just -- no, this is my only point. I didn't know.

PRESIDENT: Excuse me, Mr. Halmos.

MR. HALMOS: Let me make a comment for the Poolesville Bulletin. Both the Montgomery County and United States Postal Service have used the Poolesville Bulletin as a means of advertising official business. Legally, there is a requirement as I'm sure you know that a certain amount of paid circulation -- it's only two hundred which would be pretty ridiculous -- our circulation has twenty two hundred. Legally we are not a newspaper of record according to the Postal Service.

But, I say that both the County and the United States Government are a quasi-government agency have considered us sufficiently legal to advertise in it for whatever that's worth.

PRESIDENT: If there are no further comments or questions -- excuse me, Mr. Mercer, you have ---

MR. MERCER: Yes sir, I just wanted to answer the gentleman's question insofar as what the rate would be to include capital improvements and principal and debt as

proposed for the Budget for the year ending June 1980, it would be five dollars and twenty cents. 71.

Assuming there was no subsidy from the general fund.

PRESIDENT: The meeting -- the hearing, rather, will be --- For your information, the hearing will be held open for five days. Anyone who wishes to send in any written comment and then it will be closed and the Commissioners will make a decision and by formal resolution will adopt a water and sewer rate.

Thank you all for coming.

WHEREUPON, the hearing concluded at 9:50 p.m., o'clock.

Poolesville Sanitary Commission
Water-Sewer Rates

Poolesville

Annual Front Foot Charges	
Water	None
Sewer	None
Total	0
Cost per 1,000 gallons	
Water	
Sewer	$2.74
80,000 gallons/year	$220.00
Subsidy (current budget)	
$92.55 per person, for family	$277.65
Total yearly cost	$497.65

USER RATE PER 1000 GAL. $= \frac{497.65}{80}$

$= \$6.22$

(Note: Table based on:

A family of three persons, owning a lot with 100 feet of road frontage, consumming an average of 80,000 gallons of water per year.

The charges shown for Poolesville water users in the accompanying table include a cost not shown directly on tax or water-user charges: An annual "subsidy" transferred to the water and sewer fund from the town's General Fund.

In the budget approved last June for the current Fiscal Year (1983), Town Commissioners included a $325,000 item to cover this subsidy.

That figures out to $92.55 cost per capita against all Town residents — or $277.65 per year for a family of three, on the basis of the current Town population of about 3,560 persons.

PUBLIC HEARING

BEFORE THE COMMISSIONERS OF POOLESVILLE

- - - - - - - - - - - - - - - - - - X
In the Matter of: :
POOLESVILLE STEP 1 :
SEWERAGE FACILITIES PLAN :
- - - - - - - - - - - - - - - - - - X

Poolesville, Maryland
Monday, August 10, 1981

The above-entitled matter came on for public hearing at 7:40 p.m. before The Commissioners of Poolesville:

Charles W. Elgin, Sr., President
Alton Brown
Phillip Harris
Mary Lu Moyer

Also present:

Richard McKernon, Town Attorney

Town Engineers:

Dennis Kamber
Ken Hosto
Stu Sibold
Ed Barth, III

John Milnor, Office of Environmental Programs

Roland Schmidt, Office of Environmental Programs

So the actual local share of costs, the difference in local share of costs in that 20 percent is really very small.

MR. MILNOR: John Milnor, Office of Environmental Programs.

To help answer this man's question back here, the user charge per thousand gallons at present flow, if this plant went on line tomorrow, these people in this town who are hooked up would pay $2.27 per thousand gallons. Can you tell them what it would cost them per quarter or per month? What's the average?

MR. BOSTO: I can compute that, yeah.

MR. MILNOR: I know I use so many thousand gallons every quarter. And I want these people to be able to multiply that $2.27 so they know what it costs them every year.

MR. KAMBER: $90 to, say, $100 to $150 a year.

What's included in your bill now are the operating costs.

MS. MOYER: Some of it is the water system.

MR. BOSTO: You now pay $2.75 per thousand gallons of water consumed. That figure is composed of retirement of debt on the water system, sewer system, sewerage treatment facilities, and operating costs for both. I don't have the breakdown of what that is.

Office of Inspector General for Audits
401 M St.,SW
Washington, D.C. 20460

Re: Poolesville, MD - Construction Grant
Project C-240479-02

Dear Mr. Dempsey:

Thank you for your letter of May 19, 1983. We appreciate your keeping us advised of the status of the investigation of the Poolesville project.

The Town of Poolesville held a public hearing on May 16, 1983 to discuss the proposed tax increase for the year ending June 30,1984. During the public hearing, additional information became available concerning water and sewer costs. Enclosed is a copy of the budget for the year ending June 30, 1984 and the account of the hearing reported in the May 18, 1983 edition of the Gaithersburg Gazette. Transcripts are available from the Town of Poolesville.

Highlights of the public hearing included:

1. In their first public statement giving a specific water and sewer rate increase due to the new plant, the Commissioners of Poolesville stated that the rate for water and sewer use will increase $0.25 per thousand gallons from $2.75 per thousand gallons to $3.00 per thousand gallons. They estimated that the total annual water and sewer bill for the average household will increase $20 to $30 per year.

2. Mr. Robert Eubank, auditor for the Town of Poolesville, stated that in order to have recovered the actual operating and maintenance expenses of the water and sewer systems without a transfer of funds from the General Fund, the rate should have been $9.23 per thousand gallons. This figure reflects an annual debt service of$150,000 to $160,000, operation and maintenance costs and capital improvements. If the capital improvement costs are depreciated, the user fee of $9.23 per thousand gallons reduces to $5.60 per thousand gallons. Note the difference between these rates given by the town accountant and the user fee of $3.83 per thousand gallons used as present costs in the affordability analysis (See letter From Mr. Earl Quance to Mr. Lawrence Salomone dated December 9, 1982, paragraph 2,line 5 and letter from Dennis Kamber of Kamber Engr. to Mr. Wm. Bulman of E.P. A., paragraph 2, line 6).

We hope that this testimony by the Town's auditor is useful and that it provides additional documentation that the water and sewer costs have been underestimated. Furthermore, when the cost figures provided by Mr. Eubank are used, the likelihood of the costs for the proposed Poolesville Sewerage Facilities Plan exceeding E.P.A. affordability guidelines becomes obvious.

Sincerely,

Lawrence A. Salomone

The Gazette

Wednesday, May 18, 1983

Petition signed by 500 hits treatment facility cost data

by Barbara Davis

Opposition to Poolesville's proposed wastewater treatment plant appears to be mounting as a growing number of residents express apprehension about the project as the late summer construction date draws nearer.

About 15 residents acted over 500 signatures on a petition objecting to the $1.6 million Environmental Protection Agency grant which supplies over half of the funding for the project.

Kathryn Zajdel, initiator of the petition, said that she had been following the planning of the proposed facility and decided it was time to find out where the townspeople really stood on the issue.

The 500 residents, who live in the town's two major subdivisions, Wesmond and Westerly, endorsed blocking the federal grant on the basis that the project's present and projected costs have been "grossly underestimated."

The petition also expressed concern that a gulf exists between the public interest and that of private landowners whose property may be eligible for developemnt if construction of the new plant lifts the current state-imposed growth moratorium for lack of adequate water and sewer services.

The petition states that the citizens are suspicious of the environmental justification for pumping federal dollars into maintaining "aptly named" Dry Seneca Creek according to federally prescribed water quality codes.

Emphasizing that the purpose of the petition was not to undermine the commissioners' work, Zajdel said that a federal investigation "wouldn't hurt." If everything is "on the up and up (town officials) will come through with flying colors," Zajdel said. "If not we will find out. Either way, the residents of Poolesville will benefit."

Zajdel echoed the complaints of other opponents of

(See PETITION, page 2)

Petition hits facility cost data

(Continued from page 1)

the project that there had "definitely been a lack of information" from town officials about how the cost of the facility is translated into cost to the town's residents.

On the heels of the petition, the Commissioners of Poolesville mailed out a newsletter to all residents of the town, defending the proposed facility on the basis that the current system is inadequate and not in compliance with state and federal regulations. According to the letter, the town could be subject to a $25,000 per day fine for noncompliance.

In their first public statement giving a specific water and sewer rate increase, the commissioners proposed a rise of 25 cents per 1,000 gallons over the current rate of $2.75, to a level of $3. They estimated that the total annual water and sewer bill for the average household will climb $20 to $30 per year.

As they have stated in the past, the commissioners reiterated that the cost of new water and sewer lines to serve areas that may be developed in the future will be absorbed by the builders.

In yet another arena, the project's most vocal antagonist, Lawrence Salomone, asked town consultants at the week's public tax hearing to calculate the current water fee that would recover the total cost of the system, including the general tax fund subsidy to the water and sewer fund.

Town accountant Robert Eubanks responded with $9.23 per 1,000 gallons, which reflects an annual debt service of $150,000 to $160,000 on a general obligations bond, capital improvements, and operating and maintenance costs. He noted that the bulk of the debt service on the bond was interest which was deductible by residents on their federal income tax.

Dennis Kamber, president of the town's engineering consultant firm, interjected that the actual cost would be $5.60 per 1,000 gallons per household when noncash expenses such as $65,000 per year for depreciation of future improvements were factored into the computation.

Salomone then pointed out that the effective current rate published by town officials in a document submitted to the state was $3.83 per 1,000 gallons per household and asked for clarification of the discrepancy between this figure and the $5.60.

Eubanks said tha the higher of the two figures included funding prior debt service for the existing town debt. He added that if all previous bonds were subtracted from $5.60, the result would be $3.83 if everything by the existing debt was funded by user fees. The debt on the current system is paid from the water and sewer budget.

Comparing the rate structure of the current system with that of the proposed plant, Town Commission President Charles W. Elgin Sr., noted the new facility would be funded exclusively with user fees, which include debt retirement, while the onld one is supported by both user fees and tax revenues.

Kamber said that the actual operating costs of the new facility plus the $25,000 in new indebtedness would provide the basis for a fees of $3 per 1,000 gallons.

After nearly an hour of discussion in public hearing on maintaining the current property tax rate which generates revenue for the town budget, Salomone contended that he had heard "no answers that resolve the discrepancies. We start with $9 and remove costs until we get down to $3.83. Still there is no clear explanation."

A number of things have changed the picture from the preliminary estimates to where the town government is now, Elgin countered. The town expected to receive 87.5 percent funding for the project. Instead, 97 percent of the $2.26 million facility's cost will be subsidized by state and federal grants, he pointed out.

Another factor that lowered the cost to residents, according to Elgin, was the state public works loan at a low interest rate of 6.09 percent for 30 years.

Still pending are the results of an internal audit of Environmental Protection Agency files by the agency's inspector general that was sparked by Salomone's request for a federal probe, of the town's sewerage facilities plan.

I. SOLOMON, M.D., PH.D
SECRETARY

DONALD H. WOREN
DIRECTOR

August 15, 1977

The Honorable Samuel Zattiero
President
Town of Poolesville
P.O. Box 158
Poolesville, Maryland 20837

Dear Mr. Zattiero:

The Environmental Health Administration has made a determination that the Drinking Water Supply System serving the Town of Poolesville is inadequate to serve the needs of its residents.

Therefore, in accordance with Article 43, Section 387C (d) 3, no further building permits are to be issued for construction which will result in an increased demand on this system until an uninterruptable adequate supply of safe drinking water can be provided to all residents.

Sincerely yours,

Donald H. Woren, Director
Environmental Health Administration

IN THE MATTER OF	• SECRETARY OF HEALTH AND MENTAL
THE POOLESVILLE DRINKING WATER SUPPLY SYSTEM	• HYGIENE
Serve on:	
The Honorable Samuel Settiere Mayor of Poolesville P. O. 158 Poolesville, Maryland 20837	• ENVIRONMENTAL HEALTH ADMINISTRATION • 201 West Preston Street • Baltimore, Maryland 21201

***

ORDER

THE POOLESVILLE DRINKING
WATER SUPPLY SYSTEM

WHEREAS, the State of Maryland, Department of Health and Mental Hygiene, pursuant to the powers, duties and responsibilities vested in and imposed upon, the Secretary of Health and Mental Hygiene by the provisions of Article 43, Section 387 et seq, Annotated Code of Maryland, as delegated to the Director, Environmental Health Administration, has conducted an investigation and has determined that deficiencies in the facilities of the existing drinking water supply system including but not limited to an inadequate source of supply cause inadequacies to exist in the quantity of water supplied to the residents of Poolesville and thereby constitute a menace to the health safety and comfort of the public.

It is this 17 day of August 1977 therefore ORDERED by the Director, Environmental Health Administration that:

1) The Town of Poolesville enter into a Plan for Compliance with the Environmental Health Administration for upgrading of the existing water supply system within 60 days. This Plan for Compliance shall include but not be limited to:

ATTACHMENT A

8. a study of the ground water resources of the vicinity of Poolesville so as to determine any limitation on availability of water for potential development.

DATE:

August 19, 1977

SECRETARY OF HEALTH AND MENTAL HYGIENE

By Donald H. Noren

Donald H. Noren
Director
Environmental Health Administration

Approved as to form and legal sufficiency

this 17 day of August 19 77

Francis Di Dato

ASSISTANT ATTORNEY GENERAL

Philadelphia, PA 19106

Dear Mr. Bulman:

As a result of your efforts, we have received information from Mr. E. Quance of the Maryland Office of Environmental Programs regarding the Poolesville Sewerage Facilities Plan. We have reviewed this data and it indicates:

1. The E.P.A. is providing the majority of funding to implement a 4.5 million dollar sewerage facilities plan to maintain the water quality of a DRY creek. Note that the Poolesville wastewater treatment plant discharges into Dry Seneca Creek. Dry Seneca Creek has a 10yr. 7 day low flow of 0.35 cfs. The Poolesville Town leadership agree that the environmental need for this project is non-existent or very minor (see editorial from Western Montgomery Bulletin dated Feb.26,1983 that is enclosed.).

2. Information regarding annual operational costs to run the present secondary treatment system and the future tertiary treatment system has been inconsistent and does not agree with public testimony given on these issues. Variations of over 60% have been reflected in the data.

Based on these unexplained discrepancies and possible misuse of Federal funds, we request:

1. A Federal investigation to verify that the intent of Federal legislation regarding funding for projects of this type are being strictly followed.

2. An independent audit of the Poolesville Water and Sewer Fund to resolve differences in reported current sewerage user fees (Present Plant) and projected user Fees (Proposed SBAST Plant)

We ask your assistance in this matter. Since Construction bids are due out in Spring, 1983, we request a response as soon as possible. We would appreciate a response by March 14, 1983.

Yours truly,

Lawrence A. Salomone

Sewer Program – For The Fish?

Some has said that you can learn a great deal, if you just listen.

We followed that precept last Saturday morning, during a local visit by the area's new Congresswoman–Mrs. Beverly Byron.

And we learned, from the mouths of two local men who were trying to get Mrs. Byron on their side in their persistent battle against the Town's sewer upgrading plans – something quite new :

They said that real purpose of upgrading and expanding the Town's sewage treatment plant is very simple: The whole thing is begin done solely to improve the water quality in Dry Seneca Creek for the benefit of fish, and to improve the "swimmability " of the stream itself.

They added – for Mrs. Byron's benefit – that these objectives (plus adding to land values) seem to be a pretty ridiculous reason for spending several million dollars of Federal, State and local money.

We are amazed at these ridiculous charges and allegations:

In the many years that we and others have been following and urging the upgrading of the Town's sewer system, we never even once thought about the welfare of the fish, or swimmers (what swimmers?).

In our simplistic approach, we have always believed that the improvement and expansion was necessary to handle, safely and efficiently, the sewage produced by the existing community, as well as to provide for some modest, controlled and much needed future growth.

Of course there's no question that improving the quality of the affluent discharged to the Creek from the Town's plant will benefit the local area. In fact, we have seen some State reports over the years indicating that there are, even now, more fish – such as they are – in the stream than there have been for a century or so. That's largley because the Town has been augmenting streamflow by a couple of hundred thousand gallons of water per day, and has improved its quality. After all, that is the main purpose of the current facility - and it has done its job.

We've never heard, though, of anyone using the Creek as a bathing beach, anywhere, any time (expect maybe for wading). It is entirely too rocky, too shallow, and inappropriate, for such purposes.

Unfortunately, wild charges those made to Mrs. Byron are symptoms of a particular tendency among people who like to boast of their technical and scientific knowledge: They delight in seizing on some obscure point, taking it out of context, and trumpeting their "discovery" in efforts to damage someone else's efforts.

Fact is that stream improvements is included in the list of benefits from the sewer work that Town engineers submitted in the Town's successful application for funding. But this was lasted as a logical and common sense outcome of the planned work–and very definitely as secondary or tertiary benefits, not the principal one.

As to involving Mrs. Byron – we think she has the sense to believe that the homework has been done on this project at all levels, that it is a good one, an affordable one – a town affair, and should be

MAR 15 1983

Mr. Lawrence A. Salomone
19108 Hempstone Avenue
Poolesville, MD 20837

Dear Mr. Salomone:

This letter is in response to your letter dated February 27, 1983 (and co-signed by Mr. Watson) concerning your continued unhappiness with the EPA construction grant given to the Town of Poolesville for the purposes of constructing a sewage treatment plant and other improvements to the sewer system.

Even though most of your questions have already been answered on numerous occasions by EPA, the State of Maryland, the Town of Poolesville, and their engineering consultant, I will again attempt to answer them to your satisfaction.

The first issue that you raised concerns whether or not we are funding a project to protect a dry creek, even while acknowledging that the ten year/seven-day flow of Dry Seneca Creek is 0.35 cfs. By definition, any stream that has a ten year/seven-day flow greater than zero is not a dry stream.

Secondly, you enclosed an editorial from The Western Montgomery Bulletin proposing to show that the Poolesville town leadership agrees that the environmental need for this project is non-existent. Since the Town of Poolesville is the grantee for this project and not the local newspaper, I fail to see any relevance to the Bulletin's editorial position on this issue.

Thirdly, you again raised the issue of costs for the proposed system. Enclosed is a copy of our latest correspondence from the Town's engineers, dated December 1, 1982, which details the engineer's estimates for existing and future costs. We have reaffirmed these figures by telephone with the consultant as a result of your latest letter.

Fourthly, you have asked for a Federal investigation to verify that Federal legislation intent was being followed for this project. I can assure you that this project would not have been funded initially if it did not meet the intent of the federal legislation. This project has been repeatedly reviewed by EPA and the State as a result of your previous letters, and we do not see the justification for another Federal investigation.

Fifthly, you asked us for an independent audit of the Poolesville Water and Sewer Fund. Apparently, you have a total misconception of the role of the Federal government in general, and EPA in particular, in this project. We have no authority or responsibility in such a local matter as the current operation of the water and sewer funds. We are completely satisfied with the figures derived by the Town's consultant concerning estimates of future user costs, and the State will be reviewing the Town's user charge system as a routine requirement of the construction grant program prior to initiation of construction.

Lastly, but far most importantly, is your statement of a "possible misuse of Federal funds." We take this statement very seriously. You did not raise this issue in your previous letters to us. There is no information in our records, including your most recent letter, which leads us to believe that Federal funds have been misused. If you have specific information which you are using as the basis for your allegations, we urge you to send your information directly to the EPA Inspector General at the following address:

Mr. Charles Dempsey
Acting Inspector General (A-109)
U. S. Environmental Protection Agency
401 M Street, SW
Washington, DC 20460

We have sent to the Inspector General copies of your February 27, 1983 letter and a copy of this letter, pending submission of further information, or for his independent action if he considers any to be appropriate.

Sincerely yours,

William M. Bulman

Re: 3WM20
Existing and Projected Sewerage System User Charges for the Town of Poolesville
Grant No. C-240479-02

Dear Mr. Bulman:

As per my December 1, 1982 telephone conversation with Andrew Uricheck, please find enclosed a revision of the November 9, 1982 Financial Capability Tracking Sheet for the referenced project. In reviewing this user fee analysis with the Town's accountant, an error in our computations was noted.

The November 9, 1982 letter stated that in order for the Town to recover the actual operating costs of both the water and sewer systems, during FY 82, a user fee of $3.29 per thousand gallons, or $2.22 per thousand gallons for sewer and $1.07 per thousand gallons for water would have been necessary. The corrected value is $3.83 per thousand gallons, or $2.59 per thousand gallons for sewer and $1.24 per thousand gallons for water. While the average household in Poolesville paid approximately $211 for water and sewer service last year (based upon an average daily consumption of 210 gpd and a user rate of $2.75 per thousand gallons), the actual cost of providing that service was $293.

A recomputation of the financial impact of the proposed wastewater treatment plant construction and the rehabilitation of the existing sewer system resulted in an increase of the annual sewer user costs by $0.68 per thousand gallons from $2.59 to $3.27 per thousand gallons. The projected total annual user cost after implementation of the project would now represent 1.07 percent of the median household income, or an increase of 0.22 percentage points.

[illegible] our [illegible]
and hope that this [illegible] not cause [illegible]

Re: C-240479-01
Poolesville, MD

Kamber Engineering Company
2301 Research Blvd.
Rockville, MD 20850

Dear Mr. Kamber:

In the aftermath of the evening meeting involving town officials, your firm, EPA, Maryland and other interests in Poolesville on August 11, 1982, I have received from Mr. Lawrence A. Salamone, a Poolesville resident, further inquiries concerning the referenced project. Mr. Salamone's questions were wide-ranging and generally followed along the same lines of those he asked in his letter report of June 30, 1982.

I have read your responses (dated August 11, 1982) to Mr. Salamone's questions. In my view, your answers were factually correct with respect to the various aspects of the municipal permits and construction grants programs, and on other aspects your answers also had every appearance of being responsive to the questions to the extent possible given the current stage of this Step 4 project. I point this out because I am about to ask a variation of a question you have already addressed.

My concern is basically focused on project affordability. I am well aware that at this stage you can supply nothing more than estimates of user costs (as you said on page 7 of your response). I am also aware that Poolesville's current water and sewer charges are not separated and in fact may be supplemented by using general funds. Nevertheless, I would ask that you supply your best reasonable estimates of current and prospective sewer user costs and use those estimates to complete a financial capability analysis on the enclosed form. I realize this will require an estimation of the breakdown of the currently combined water and sewer charges, but I believe such a breakdown is needed for planning purposes even if a worst-case assumption is used.

The form is extremely brief and we have partially completed it in advance (questions 1, 2, 3, 4, and 9). The local median income level is a Standard Metropolitan Statistical Area figure from our data (#4) and the cost benchmark (#9) is from EPA affordability guidance and is linked to the median income level. In this case, the median figure of $23,344 dictates a benchmark of 1.75 percent. You should use a different median

income figure if you have data showing a different number is appropriate, but the benchmark will not change unless the median figure drops below $17,000.

In supplying the remaining figures, I would expect that you will add statements which condition or qualify your estimates. Please call me or Andrew R. Uricheck (215-597-9966 or 9783 respectively) if you have any questions about the form.

For the record, I would like to add my view of another related issue, one that I understand was raised and discussed at the August 11 meeting. The Poolesville wastewater treatment project provides reserve capacity with the usual possibility of additional development in the service area. Allegedly, a certain amount of such development would eventually require expansion of the local potable water system. If so, prudence would dictate that the cost of the effects of that expansion be considered. However, it is my view that the decision on how to levy such costs among existing and prospective potable water users is a local decision and is not in any way linked to the user charge system required by the construction grants program or the Clean Water Act.

Again, let us know if you have any questions.

Sincerely yours,

William M. Bulman

Toms Brook - Maurertown Service Authority
"Sewer and Water Services to Our Community"
East Creek Road / Post Office Box 87
TOMS BROOK, VIRGINIA 22660

October 21, 1982

Mr. Larry Salomone
19108 Hempstone Avenue
Poolesville, MD 20837

Dear Larry:

It was a pleasure meeting you and the family a few weeks back. I hope you enjoyed our neck of the woods and that you'll plan a return visit in the very near future.

It was interesting to learn that you are also involved with a local sewer authority. As a member of the Board for the Toms Brook - Maurertown Service Authority, I thought I'd briefly share with you the major problems that we have encountered:

A. The system was grossly overdesigned - total daily capacity is 189,000 gallons and we are only using 50,000. Also, an independent engineer has specifically identified approximately $260,000 worth of unnecessary design work.

B. Serious cost over-runs - in addition to being overbuilt, final charges far exceeded original estimates.

C. We are currently attempting to close both a FMHA Loan ($398,700) and grant ($91,900). It amazes me that the government will offer large sums of money to a small community and expect that the local community board members be knowledgeable in the proper disbursement of these funds.

Please see the enclosed articles from two of our local newspapers. You will note that the system was pushed upon the community and that only half of those required to hook-up have in fact done so.

I leave you with one thought. Before any discussion is made to expand your system, be absolutely certain that you are given the full picture - from accurate cost estimates of exactly what you will be getting to the individual who is specifically responsible for heading up the project. Also, in using FMHA Funding, it is entirely possible that they will require mandatory hook-ups for everyone in the service area, a point that has sadly divided our community.

Best of luck.

Sincerely,

RJC

Richard J. Church

REPORT BY THE U.S.

General Accounting Office

Wyoming Wastewater Treatment Facility Proves Unsuccessful

In 1973 a wastewater treatment facility was designed principally to treat wastes from a cheese manufacturing plant in the small Wyoming town of Thayne. Today, the $1.15 million failing facility partially treats only 106 sewage hookups in Thayne, while the cheese plant discharges its highly concentrated, untreated wastes directly into a local waterway.

The project also has been beset by such problems as poor design, construction, and plant operation; inadequate program and financial monitoring by the Environmental Protection Agency; and ineffective program management by Thayne.

GAO is making several recommendations about the project's financial activities.

CED-81-94

May 5, 1981

Mr. Henry Eschwege
Room 6146, GAO Building
441 G. Street N.W.
Washington, D.C. 20548

Re: Draft Report regarding Thayne, Wyoming
Wastewater Treatment Facility

Dear Mr. Eschwege:

I am writing to you to provide comments on behalf of the Town of Thayne, Wyoming to the GAO regarding the draft of the GAO proposed report regarding the wastewater treatment facility in the Town of Thayne, Wyoming.

The specific responses of the Town to this draft report are contained in the comments provided with this letter, and in the responsive comments prepared by the Town's engineer, Tudor Engineering. The Town requests that both the enclosed comments and the comments submitted by Tudor Engineering be included together with this letter as the Town's reponse to the draft report. The purpose of this letter is to provide some background information regarding the history of the project which is not contained in the draft report.

The Town of Thayne is a small town and has been a small town since its incorporation. Most of Thayne's citizens are long-time residents of the Town. The Mayor and council members are people who have full time private occupations and serve the Town in addition to carrying on their private businesses. None of us are engineers or accountants, and none of us has any special knowledge of the technical aspects of sewage treatment. We are small town people trying to provide for the needs of our neighbors and our community. Neither I nor any of the present members of the Town Council were serving as Mayor or members of the Town Council when the wastewater treatment project was begun. Thus, we do not have first hand knowledge of discussions and meetings which took place in the early years of the sewage treatment project. All of the members of the present town government do have considerable general knowledge of the problems and failures of the plant as initially constructed, as it has been a matter of considerable public concern in the Town of Thayne for a number of years.

Council, perhaps mistakenly, relied upon the experts in DEQ and EPA to openly and fairly advise the Town as to what was necessary to meet the statutory and regulatory requirements of these agencies. The Town relied on these agencies and had no reason to do otherwise.

Now the Town is left with a sewer system it never needed and doesn't want, and the problem of the cheese factory wastes is still unresolved. The Town of Thayne would like nothing better than to give the entire system back to the state and federal governments and return to the use of septic tanks, but that unfortunately is not possible. The Town is faced with continuing problems with the defective collection system and no money to pay for repairs to this system. The Town is faced with perpetual costs of operation and maintenance of the sewage treatment facility. Trying to be good neighbors, the people of the Town of Thayne have been burdened with objectionable odors, a defective sewage treatment system and long-range financial burdens. I hope your report will clearly document these facts.

The Town requests that the comments submitted with this letter, as well as the comments from the Town's engineer, be included as part of the comments of the Town of Thayne in repsonse to your draft report.

On behalf of the members of the Town Council, I thank you for the opportunity to provide these comments to your agency.

Very truly yours,

Charles Dana

Charles Dana, Mayor

On page 9 of the draft in the third paragraph there are statements regarding assurances which were given to the Town that the sewage treatment facility would work. There were representations made by both the EPA and the DEQ that the spray field treatment system would work, and the Town of Thayne relied upon the specific representations of these regulatory agencies in approving the system which was constructed.

The extracts of the clean water act and EPA regulations set forth on page 9 of the draft bear no relationship to the actual course of events which took place between the Town and EPA. The Town agreed to build the sewage system it didn't need in reliance on the representations of EPA and DEQ that the project would work. EPA and DEQ specifically reviewed and approved the design of the initial treatment system and the Town was never advised by these agencies that although they were telling the Town what kind of system to build and how to build it, they would have no responsibility for any design deficiencies or other problems with regard to the treatment system.

[GAO COMMENT: We state on p. 8 that we could find no support for Thayne's contention that EPA insisted that Thayne adopt the sprayfield system.]

The statements on page 9 regarding the level of treatment prior to application to the spray field demonstrate the kinds of political pressure with which the Town of Thayne was being whipsawed by various government officials and agencies, which pressures had little relationship to the legitimate needs of the people of Thayne or the possibility that the treatment facility would be capable of performing adequately.

[GAO COMMENT: None.]

On page 11 it is noted that the SVCC discharged wastes substantially in excess of the design capacity of the original Town facility. The Town agrees that this took place consistently after the ownership of the facility changed hands and was one of the two major causes of the failure of the system. The Town takes exception to the statement that "excess BOD loadings such as these measurements show can cause problems". The Town believes that the excess discharge levels from the cheese factory did cause problems and disputes the statement in the draft report that the problems from such overloading were only potential.

[GAO COMMENT: We are not disagreeing that SVCC's discharges did in fact cause problems. The purpose of the statement Thayne takes exception to was to explain how excess BOD loadings at any treatment facility can affect the facility's operation.]

Mr. ROE. Please proceed.

TESTIMONY OF LAWRENCE A. SALOMONE, POOLESVILLE AREA CITIZENS, POOLESVILLE, MD., ACCOMPANIED BY BOB WATSON

Mr. SALOMONE. Thank you, Mr. Chairman. Accompanying me today is Bob Watson.

Mr. Chairman and members of the committee, my testimony concerns the construction grants program and its impact on towns. As background, consider the following: in 1979, then EPA Administrator Kostel stated for every Federal dollar that is already cleaning up our water, another $11 have been in construction of plants that have yet to process a single kilogram of waste water. As a result, many towns, for example, Manassas, and Manassas Park, Va., and Thayne, Wyo., have received funds from the Federal construction grants program and now they have defective sewage treatment systems and/or long-range financial burdens.

EPA's own data indicate that as many as 50 percent of the Nation's waste water treatment facilities fail to operate properly due to such factors as improper system design and installation and poor operator training. A major issue of growing concern to me, as well as to some of your colleagues, is the financial impact of the grants program on State and local governments, particularly the cost to local governments to operate and maintain these new facilities. It should be clear that the construction grants program is not working well. Perhaps now is the time for reconditioning and fine tuning so that the available funds can be used more effectively to protect the environment. For this purpose, I am providing you with information regarding the need, approach, and costs for a proposed sewage treatment plant in Poolesville, Md. This information will serve to illustrate why the construction grants program should be fine tuned. The town of Poolesville, population 3,500, in upper Montgomery County, Md., is seeking a new federally funded $2 million tertiary treatment plant that will allow the town to approximately double in size.

A large number of citizens is challenging the town board of commissioners on the wisdom of building the plant, calling it too big, too costly, too sophisticated, and unnecessary. Seven years of water quality data show that the environmental need for the plant is nonexistent or very minor. The EPA is providing over $2 million to maintain the water quality of an intermittent creek, named Dry Seneca Creek, as fishable and swimmable.

Present and future costs seem to have been grossly underestimated. The town auditor stated in a public hearing that present water and sewer costs are about $5.60 per thousand gallons. Yet the town's engineer and the commissioners of Poolesville have used $3.83 per thousand gallons as the present water and sewer costs in the affordability analysis required by EPA, Region 3, and the State of Maryland.

Regarding future costs, the Poolesville Town Board made no public statement of the financial impact of the proposed project of the town residents until the release of the May 13, 1983, newsletter, almost 2 years after the August 10, 1981, public hearing required by law for this project. The town board stated in this news-

letter that the proposed tertiary treatment plant, which would serve about twice the present population of Poolesville, can be built, operated and maintained for a mere 25 cents per thousand gallon increase to the current water and sewer rate. In addition, the shortage of available funds for potable water to meet the needs of the current residents suggests that our health and safety will be jeopardized further by construction of the plant with its demand for twice as much water as is currently available.

Also the proposed treatment plant is planned for construction before the major inflow and infiltration problem of the collection system is solved, that is 1 million gallons per day during storms, three times the normal flows to the existing treatment plant.

Despite the legal, technical, and economical reasons for not awarding the Poolesville grant, and the fact that a small percentage of the projects funded actually are complete and contributing to water quality improvement, EPA Region 3, the Office of the Inspector General of the EPA, and the State of Maryland supported an inappropriate technology for the Poolesville situation. Although an environmental impact statement should have been required for this project, an environmental impact statement was not required by the Office of the Inspector General and EPA Region 3.

The Poolesville situation is symptomatic of a much deeper problem with the way the construction grants program is being administered. The costs and environmental benefits of using the proposed technology are significantly out of balance. Water quality data should be used if available and good water quality monitoring programs should be established to keep decisionmakers from making costly decisions based on the lack of information or on misinformation. The EPA and the States should make the right selection in streams uses that these are realistic and attainable uses. The Clean Water Act should be amended to provide that compliance orders shall include a cost-benefit analysis.

Future costs of federally funded wastewater treatment plants are frequently underestimated. The user charge system required by the Clean Water Act should reflect all of the components that will be necessary to maintain the financial integrity and self-sufficiency of the system. The Clean Water Act should be amended to insure that all relevant costs are included in the user charge system to insure that the affordability analysis is performed using representative cost figures.

The Federal Government, under the Clean Water Act, should not continue to offer large sums of money to small communities and expect that the local community board members are knowledgeable in the proper disbursement of these funds. Some of the postmortems done on towns with defective treatment systems and long-term financial burdens show that towns cannot always rely on the advice of their engineering consultants and the EPA.

Treatment plants have been overdesigned and the treatment process selected have not been compatible with the ability of the community to operate and maintain the system. The Clean Water Act should be amended to enhance accountability.

This concludes my statement.

Mr. ROE. We want to thank you, Mr. Salomone, for your valued testimony.

Basically, I think what you are saying then in the particular illustration that you brought to our attention is that the folks just did not get the facts straight at the outset; is that correct? The information was incorrect?

Mr. SALOMONE. It was incorrect in the initial stage and it has been incorrect to this day. And there is no mechanism in the construction grants program to insure that the errors and discrepancies that you would see in the backup documents are eliminated. I attended the hearing, the public hearing that was required by law, and observed the representative from the State of Maryland ask the town for the cost of the system. He wanted to know what the new user fee would be. They did not know and yet there was no mechanism to follow up, to ever find that out. If the citizens of Poolesville had not taken the initiative to demand an answer, we would not have gotten to the point that we see the discrepancy of $5.60 versus $3.83 that we see today. Before then, we did not have a discrepancy because they did not have any cost figures. Now we have pushed them and they have given cost figures, but the cost figures used in the affordability analysis are different than what the CPA for the town and the engineer have testified in public hearings for the town and what they used in the affordability analysis.

Mr. ROE. The gentleman from Oregon.

Mr. SMITH. Thank you, Mr. Chairman.

Mr. Salomone, in what capacity are you here? Do you represent Poolesville area citizens and how is that done? Are you here as an individual?

Mr. SALOMONE. As an individual representing those citizens who are concerned about this project.

Mr. SMITH. I see, OK.

Well, it is new to me, I guess, but for a community to say, no, we do not want a Federal grant, it is just backward somehow. I always thought communities applied for Federal grants, you know. So I am interested in that.

I guess my question, and taking the lead of the chairman's position or thought, would not a dollar for dollar match with respect to an EPA loan extract the same kind of requirement that you want?

Mr. SALOMONE. I think the question of the mechanism for funding a project is not really the point that should be made. I think we have to back up a bit and look at the way they established the need, the approach, then we get to the costs. Before you get to the costs, whether it be a loan procedure or an outright grant, you have to look at how they establish need today. And in the case of Poolesville, we have an intermittent creek, most times of the year you can straddle the creek, you can also see the bottom of the creek, the pebbles because it is so clean. The water quality data collected by Montgomery County supports that and yet they have decided to fund the grant on the grounds of environmental need.

Mr. SMITH. Well, I am suggesting that would not Poolesville be very much more careful about appropriating $1 million of their own money rather than spending it on a $2 million grant, that is my point.

Mr. SALOMONE. What I have observed in other towns, and what I have heard today also supports that the commercial interests for

development in many of our towns in the country suggests that the pressures to grow are such that despite the prudence in rejecting an illogical approach, you may still go down that path until it is too late.

In the case of Poolesville, the information with respect to cost was so sketchy that there would not be the awareness on the part of the residents until it was too late.

Mr. SMITH. Thank you, Mr. Chairman.

Mr. ROE. Mr. Moody?

Mr. MOODY. Why are they making such a poor decision at the local level?

Mr. SALOMONE. Well, we have provided information which indicates that the president of the commission has land that was originally scheduled to be developed which now, because of the shortage of water and sewer, there is a moratorium on the town. Also, there are those few individuals in town that feel that the growth for the town is the way to go. They are the ones directing in this case.

Now, with the policies of the Clean Water Act being so vague with respect to the balance between environmental benefit and costs, the general interest gets confused with the private interests in this case, and it is very difficult to sort out the two.

Mr. MOODY. Are you saying that most of the citizens of the town do not want to build a system which would accommodate growth but that few people do who control the council or whoever makes the decision?

Mr. WATSON. I am Bob Watson. I think the real issue is not growth or no growth. I think most of us in Poolesville want other people in Montgomery County to share our town and to live in it. It is a nice place, it has got a good school system and it needs to grow. What is missing all the way up to the highest level of the EPA is not the grant of money to build a plant but the estimate of the operating costs and the effect of those operating costs when we citizens will have to pay the bill. When the town of Poolesville is allowed to put out a document to everybody in town saying that the cost of this new plant is going to be 25 cents per thousand increase and the highest levels of the EPA and Inspector General's Office support that, something is wrong with the system. We know in fact we are going to be talking in terms of a $5 to $8 increase. Is that right, Larry?

Mr. SALOMONE. Yes; they went so far as to say that the cost will go down as the development occurs. I would also like to make a very important point of why we raised this issue and why we are perhaps setting a precedent for coming—suggesting turning away a grant. That is if the construction grants program funds a tertiary treatment plant for Poolesville, then that money is not available for those towns who really need it to clean up a more environmentally hazardous condition, and that is the point. It is not growth versus nongrowth.

Mr. MOODY. Is not the State supposed to, in its priority lists, supposed to make those kinds of decisions? Is not that what the State's priority listing is all about? Avoid that very thing where you send money to towns that do not need it very much and deny towns that really do?

Mr. SALOMONE. I cannot speak for why the State has funded this.

Mr. MOODY. Poolesville is on the State priority?

Mr. SALOMONE. Yes. However, my review of the available information, and I encourage others to do the same, leaves you with the conclusion that you cannot understand why.

Mr. MOODY. Have you asked State decisionmakers?

Mr. SALOMONE. That is correct.

Mr. MOODY. What did they say, why was Poolesville put on and other States left off?

Mr. SALOMONE. The State of Maryland declares all surface waters as class I. So you are required to maintain them fishable, swimmable. Consequently, while this stream has acceptable water quality when there is water in the stream, when you get to the 10-year, 7-day low flow, essentially in this case, 20 garden hoses worth of flow, you cannot meet the criteria of a class I water. Consequently, they consider that necessary.

Mr. MOODY. In other words, there is no separate standard for creeks that are dry, as dry as the one you described?

Mr. SALOMONE. Yes and that gets back to my statement that if you are going to have it a goal of the Clean Water Act to make all surface waters fishable, swimmable, we should insure that the use is realistic and attainable.

Mr. ROE. Would the gentleman yield?

Mr. MOODY. Surely.

Mr. ROE. You also made a comment, as I recall it in your testimony, that somewhere in the order of magnitude of $1 million may be needed to correct the infiltration problem.

Mr. SALOMONE. That is the flow, the million gallons per day is the flow. When the normal flows are about a third of that.

Mr. ROE. That is what I am saying. So there is a very heavy infiltration problem involved having nothing to do with this tertiary situation?

Mr. SALOMONE. That is correct, and my recommendation would be if we are looking for effective use of our Federal funds, is to fix the collection system. Then we see what flows are going to the system and we may find that the existing secondary treatment system can handle the flows. But why go in just as you pointed out earlier, build a fancy plant and still perhaps be overrun because of the inflow and infiltration problems?

Mr. ROE. I am trying to get into the record though, on the basis of your testimony where the infiltration was concerned, that would also have a bearing on the size of what a tertiary treatment may be. If you do not get to solving the basic problems of the system you are simply adding to it, therefore, building a larger tertiary treatment plant to handle the rainwater.

Mr. SALOMONE. That is correct.

Mr. ROE. That is what I want to get on the record. So that is part of it.

Mr. SALOMONE. Right. And also though, it is important to point out that there is not adequate water supply to meet the design capacity of this plant.

Mr. ROE. If the gentleman would yield further, it seems to me that one point you are making is that we ought to look into the present conditions and provisions of the law to determine whether there should be a test written into the law that infiltration be con-

sidered in any expansion and that should have a priority in any part they are going to clean up and that is the point I think you are leading to.

Mr. SALOMONE. That is correct.

Mr. WATSON. Mr. Roe——

Mr. ROE. The gentleman from Wisconsin?

Mr. WATSON. I was really pleased to hear your comment that the funding from the grants program should address multiple issues, not just one single issue and that is what we have run up against in Poolesville. Business, and industrial proponents saw a chance to get some quick money right now. They are afraid the money might get away from them by taking the proper approach. The proper approach is to fix the I&I first, so you know what your final I&I is. You see, they already built this—designed this plant based on what, 80 percent reduction in I&I, Larry?

Mr. SALOMONE. 150,000 gallons per day is the design inflow and infiltration rate.

Mr. MOODY. Even though they have not checked that number?

Mr. SALOMONE. That is correct, and in cases of severe storms it exceeds a million gallons per day.

Mr. WATSON. So they have designed a plant, they have no idea what the I&I is going to be and Poolesville right now in the summer cannot barely deliver 200,000 gallons of water per day. The EPA is funding a 600,000 gallons per day treatment plant. If we, in fact, in Poolesville have to support a 600,000 gallon per day tertiary treatment plant, with 10-10, 10 milligrams per litre—5 day biological oxygen demand, 10 milligrams per litre of total suspended solids with only the current residents using 200,000 gallons of potable water, our costs per thousand gallons are going to be through the roof. Growth is going to be gone, our homes are going to be gone and we are going to be added to the list of towns that EPA has devastated. But we are going to be different in one way and that is we have documented this to the highest levels of EPA, the highest levels of the State of Maryland and the U.S. Congress and they are still going ahead with it. Even the Inspector General's Office, talking with Larry 2 days ago, said this plant may cost $1 million more than we think it is, but do not worry about it. It is 97-percent funded by the Federal Government. Larry said that is an awfully cavalier attitude to take toward Federal money.

Mr. MOODY. Not only that, the downstream operating costs are going to be on your back.

Mr. SALOMONE. That is correct; 75 percent or more inducement to towns, is quite attractive on first look. However, when the EPA walks away and you have a concrete monument that you have to operate and maintain, that is when the problem just begins.

Mr. MOODY. So you say they put the cart before the horse. They built the plant without knowing the exact need on the I&I side of things?

Mr. SALOMONE. That is correct, they also have selected an innovative technology that is an activated sludge system, when a previous engineer for the town suggested using the present lagoon system and making the necessary modifications in the system to handle the more critical design flows that occur during the

summer months. And yet they have taken the Cadillac approach because they feel it is giving them the capacity that they want.

Mr. WATSON. You will notice when the town took the Cadillac approach they got 400,000 gallons more treatment capability than if they took the lagoon approach.

What we are saying is if you are going to expand the town let the new people in the town pay for a sewage plant that will support them and a water supply if it is adequate. Do not allow the present residents to be manipulated into building a concrete monument. We will then have to beg other people to use it to get our unit cost down to where we can keep our homes. And we have gone to the highest levels and they said: "no; build the oversized plant."

Mr. MOODY. Have you availed yourself of the normal political channels to get redress? Have you addressed your State legislatures and addressed your Federal Congressmen to deal with EPA and your State legislators to deal with your State government and so forth?

Mr. WATSON. Absolutely.

Mr. SALOMONE. Yes; and we always got a very good response at the beginning. A few days later or weeks later when they respond, they come back, it is a local issue. And yet there is Federal money.

So I believe it is more than just a local issue.

Mr. MOODY. You do recognize the economies of scale will sometimes dictate that it makes sense to overbuild early in the phase because you do expect growth—expensively retrofit systems to allow to handle growth that occurs later. That you would not deny, would you?

Mr. SALOMONE. No question that 20-year design life is reasonable when you are building a facility.

The question is, and I repeat, Is the need there and is the approach reasonable? The technology that they are using is not appropriate because ultimately the cost to operate and maintain this innovative technology, the tertiary treatment plant, will far exceed the more simplified lagoon-type approach that was recommended by the previous engineer.

Mr. MOODY. Thank you.

Mr. ROE. Let me ask you this question if the gentleman will yield.

When you were talking about the remedies, do the bulk of the people in the town feel this way, do you think?

Mr. SALOMONE. Yes; I believe so.

Mr. ROE. Well, there is matching money involved and that has to come out of some place. Is that coming out of a bond ordinance?

Mr. SALOMONE. Yes. But, remember, it is innovative so, at first pass, the capital improvement costs for just the treatment plant comes to almost 97 percent Federal.

Mr. ROE. You are using innovative technology section of the bill is what you are saying?

Mr. SALOMONE. That is correct so that is only a 3-percent component for the town of Poolesville.

Mr. ROE. How is it going to raise that?

Mr. SALOMONE. There is a bond.

Mr. ROE. There is a bond issue, but you have redress under the law, the bond issue. Has the bond issue already been passed?

Mr. SALOMONE. There was not a bond issue in this town.

Mr. ROE. How are they going to——

Mr. SALOMONE. They applied for a loan.

Mr. ROE. From the State?

Mr. SALOMONE. From the State, and they received the loan.

Mr. WATSON. You have got to remember that misinformation for the user cost of this thing is the whole key. People in the town are being told it is not going to cost anything, it is all free Federal money, that the town is going to be able to grow. But prudence would indicate that this town is going to be under tremendous financial strain once this humongous plant is implemented. It is good to have a 20-year growth cycle but you should not use a treatment technology that will not allow you to grow without having the full 20-year cycle in place when you first start. You can expect no economies of scale, because you are only going to have 200,000 gallons a day going through a plant designed for 600,000 gallons a day. This is based on the water supply in the town of Poolesville. That may be the most we will ever be able to grow and we will be stuck with that monument. Why this has happened is that the law does not allow you to look at water, sewer, inflow, and infiltration and other areas of the environment all in one piece. The sewer people will not listen to us. They—EPA—say we are not looking at water. Water authorities—HUD—will not look at the sewer problems.

Mr. SALOMONE. Yes; that is a very important point. They would not add the water component to the user charge that they used to review the affordability.

Mr. MOODY. And your State environmental agency, whoever it is that sets these priorities, they are not willing to look at it as a total system either?

Mr. SALOMONE. No; they are not

Mr. WATSON. John Milner is in charge of that.

Mr. ROE. Where does it stand now?

Mr. SALOMONE. The report from the Inspector General's office, the EPA, has suggested that they should go ahead. Consequently permits should be issued shortly by the State of Maryland and the bid documents will go out subsequently.

Mr. MOODY. You cannot convince the local decisionmakers of your case?

Mr. SALOMONE. When the information is so sketchy and misinformed, it is very difficult.

Mr. MOODY. And you are saying that misinformation is being abetted and increased by EPA itself?

Mr. SALOMONE. They are certainly supporting the positions that began with the town of Poolesville, their engineer, and the State of Maryland.

I should also point out that, like many other local governments, the town board are composed of laypersons. Consequently, they do not have the technical expertise to understand the differences and to be aware of the problems we are talking about today.

Mr. MOODY. But no one has given them a future cost estimate that has the numbers that you have indicated? No one has shown them that? I mean lay people can understand dollars and cents.

Mr. SALOMONE. Twenty five cents per thousand, would you get upset with 25 cents per thousand? That is the only cost figures that they have provided, 2 years after the public hearing.

Mr. MOODY. What do you think the number really is?

Mr. SALOMONE. I think the tripling that we have seen in Ocean County, N.J., I think is very realistic, and as a lower bound, perhaps it is double.

Mr. MOODY. So 50 to 75 cents would be your guess?

Mr. SALOMONE. No. I would say if we are paying $5.60 per thousand gallons we are going to see something over $10 per thousand when it is all done, and we have a system that is complete with respect to water supply, collection system, and the treatment process.

Mr. MOODY. But you cannot get anyone in official position to issue that number and say that is the estimate?

Mr. SALOMONE. That is correct.

Mr. MOODY. But based on your own professional knowledge, is that where you get the number?

Mr. SALOMONE. I have experience in this area, yes. However, I might add that my role in this effort has been more as an investigative reporter because the information that I am communicating to you today is in published documents, and I simply put the story together and the construction grants program does not have the mechanism to put the story together. There are too many people looking at very small parts of the project but no one has the overview of the system. But the end product, namely the user charge system, is a result of the full picture and it usually occurs when it is too late.

Mr. ROE. Well, I think, if I can offer the suggestion, we are working on revising the law. That is the purpose of your testifying.

On the other hand, you have a situation existing that is imminent unless somebody does something, and it seems to me that we know that we will finish the hearings by the 17th or thereabouts of November, and we have to write this bill. So before this bill comes out to the floor, probably it will not be until February or March of next year. I think the Senate is working along paralleling our efforts too, as you know.

So that remedy that we may come up with, and understand what you are talking about, in legislative law is going to take time to finish and put into law. In the meantime, your freight train is going down the track, so to speak. It seems to me that if you have gone through those particular situations, that every level of government, that your only course is to go into the courts.

Mr. SALOMONE. I understand. However, attempting to get us off that track is not really the purpose why we are here today.

Mr. ROE. No, I understand that.

Mr. SALOMONE. We feel that this is unique because you can observe the construction grants program step by step in that backup documentation, and it will give our lawmakers an opportunity to see why it is not working rather than just merely talking generalities.

Mr. ROE. And that is how we are looking at your testimony. Very fine.

Any further questions?

Well, you know what you will have to do and we know what we are going to do.

Mr. WATSON. Mr. Roe, one quick thing.

I think the fact that you have, I think it is 1.75 percent affordability requirement in the construction grants program which says, if we look at the median income of the town, the costs per citizen shall not exceed 1.75 percent of the median income. That is fantastic. That should be there and I fully support it. But you can just see through many, many small towns, local engineers, local businessmen get together and they subvert the affordability analysis as we have seen in the town of Poolesville, we have seen in Thayne, Wyo., and the real costs do not seem to come out until the final bills hit the citizens.

Mr. ROE. Well, it certainly should be a point of view where EPA ought to be dealing with the true cost because they are the ones that are providing. There is the point Mr. Salomone was making, they are providing this Federal money involved. And, you know, we are legislators and we set the law and we expect them to follow the law. And they are to look to the cost-benefit ratios as they go through and certainly if the public hearings are going to be of any value at all, the facts that should be presented in public hearings are the facts as they are, not some misguided estimates. And I think that is the point you are making and very well so.

Mr. WATSON. We are extremely fortunate to have Larry Salomone, who has had tremendous private experience in civil engineering, he is working toward his doctorate in civil engineering. Because of his background, we have been able to draw on water quality experts and water quality data that is not normally available. We have been able to draw on water supply data that is not normally available. All this documentation. And we are extremely lucky that we had competent people to support us, and still we are seeing EPA and the law as it is written, allowing the town to go ahead on this collision course of disaster, saying this is the way to go. The businessmen want the growth—600,000 gallons per day sure, is more than 200,000 gallons per day. This is our big chance. You see this in the local newspaper, this is our big chance. If this money goes away, we are never going to get it back. That is the carrot. You give the people this carrot. If you say no, you are going to lose $2 million. They are afraid to come out and say hey, maybe there is a better way.

Mr. ROE. If the gentleman would yield?

I would agree with what you are saying, having been a mayor of a community myself, so I realize that on both sides of the aisle.

But what I am trying to get across to you, that in this instance, this system has not worked in the direction in which the citizens would like to have it work, and they have not got the redress. The only redress they have is to go back to the courts, that I can see.

If there had been 25 percent bonding involved, then you have to have local approval of a bonding ordinance, you could have forced it to a referendum. But as you are saying, if it is an innovative technology, then 97 percent of the money is being provided through Federal, and the balance through the State, and you are denied the right to speak to the issue as citizens of the community, through the usual process. It is a very unique situation.

Mr. WATSON. The real issue would be easy. It could be very easy for us to get a referendum if the true operating cost of this plant were made known. EPA has failed us, and the law has failed us, to allow a situation where they can come out to the people and tell them it is going to cost 25 cents per thousand, then allow them to go down the pike, not realizing that it is a disaster.

That is where the error is in the construction grants program.

Mr. ROE. Well, I am not so sure that there is an error. This is a very unique case. There is not that many. There might be other problems in different areas of the country, but when you start saying 10, 15, 20,000, 50,000 cases, and you have 2 or 3,that is something, you have a very unique situation. But out of this testimony comes another issue, and you have stated that, and so did Mr. Salomone, and the point of view of the high level flow is a million gallons a day, and we are spending money to build plants that are designed, in effect, to do one of two things.

Either they are oversized to accommodate the infiltration, and/or they just open the floodgates, and let it run through the plant. So something has to be done to tighten up that section.

It would seem to me that EPA, et al., is responsible, and would have looked at that issue. We are coming back and saying that we have been fighting with the other side of the Capitol on that issue, and other people, we are coming back and saying that infiltration and elimination of combined sewers, and the other elements that we discussed today, are an integral part of the sewage disposal system, and ought to be considered as an engineering problem.

It is not a question of a figment from somebody's imagination, but unfortunately we are not dealing with that many engineers around.

So what I am trying to get across to you is I do not see any remedy, other than our feeling sorry for each other at this moment. We would like to know how to help you, but we do not have the remedy at our fingertips at the moment.

It seems to me that if you are going to remedy this issue locally, you have to force it to referendum, or go to court.

Now, if you cannot get the people to support you in the consent of the Government, then the case stands unto itself.

We, on the other hand, have benefitted from your testimony because you have given us a case history that we have to look into, and you have given us some new thoughts and ideas, as to what we should be writing into law, and that we should be considering before any of these grants are made.

See what I am trying to get at?

Mr. MOODY. Would the Chairman yield?

You can see how it is hard for us to write a law that would head off every instance of local poor decisionmaking. It is hard for us to pierce the corporate veil, so to speak, to go into second guess every decision that is being made, and you are coming up with a case that appears to be very poor decisionmaking, but you say it is being abetted by misinformation from EPA, and that is a concern of mine.

You also say that the Inspector General agrees that this thing is going to cost a lot more. Why do you not close the loophole, and

cannot the Inspector General acknowledge that they can be plugged in somehow?

Mr. SALOMONE. In practice, if you would examine the staff of the Inspector General, it is quite small. Consequently, what I have observed in their review, it took 5 months, in your copy, Mr. Chairman, there is a copy of the report, and it is approximately seven pages. They have essentially taken the previous report issued by the State, and the town engineer, and just passed it along to us, and as you see, they did not even use their letterhead, the authorship of the report is not clear.

If that report gets separated from the letter of transmittal, there is no way to know the author of that document. So it is a very poor report professionally, and it just perhaps, due in part to the lack of time on the part of these individuals that had to prepare the report.

I think that opens up a very important point, that what I have observed in the construction grants program, both in Poolesville, as well as in other towns, is that when the town residents see that they are getting a Federal grant, they believe the EPA is protecting their interest from a technical viewpoint, in terms of the selection process, and the affordability aspects.

But yet when you take a closer look, the EPA is actually relying on the engineering consultants for the town, and the town board for making the decision.

Mr. MOODY. Which has an ax to grind.

Mr. SALOMONE. That is correct, and in many small towns, you are also attracting engineers who are very dependent on the local business for their livelihood, so you are getting the local viewpoint also.

Mr. MOODY. You are getting a local viewpoint, which is not objective.

Mr. SALOMONE. That is right, and also experienced in terms of the national problem, perhaps. So consequently, the bottom line is that no one is really looking at the overview in terms of need, approach, and cost.

Mr. MOODY. Well, since we cannot second guess local decisions, effectively at all, we are just trying to write generic legislation on the assumption that local decisionmaking will be generally good.

Can you come up with some specific suggestion how the law should handle, maybe on a fail safe way, a situation as rare as it is, as you describe it, what would you suggest as a law, the generic law, read to avoid what mess you feel you are in?

If you do not have can answer now, maybe you can communicate with us later.

Mr. SALOMONE. I will indicate that it involves establishing the need, and having a major component of the law being the balance, an analysis of cost versus benefit. And that they be required to prove that there will be environmental gains in this creek, or whatever surface water they are discharging into, because if you are going to spend millions of dollars, and not see millions of dollars worth of environmental benefit, then perhaps another approach is the more prudent way to go.

Mr. MOODY. You are aware that the environmentalists have stoutly resisted cost-benefit analysis on the ground that its method-

ological loopholes, and ends up being quite subjective, and also it is extremely expensive to administer properly, and it takes a lot of resources to analyze. So they prefer instead the system, the fishable, swimmable, standards approach, and now we are talking about cost-beneficial, in a sense of minimizing cost to research standards. They do not ask us to make the standards a variable, to which is what you are asking, really.

Mr. SALOMONE. Yes, and I believe that is important, because regardless of how the financial mechanism you eventually establish, loan versus grant, unless you are using those funds effectively, you will never have enough money to clean up our Nation's waters.

So it is important to have a component in the program that establishes the water quality of some of our major surface waters, so we know how well we are doing, and where we will go, as we add effluent to the surface waters, and without bringing the pendulum back from the early days of the EPA, when we looked at it from that viewpoint entirely, unless we bring that pendulum back, we will be spending money for surface waters that do not require it. That is the need.

Mr. MOODY. Your generic suggestion would be to reinstitute cost-benefit calculations, is that how you would solve your—is that the legislative recommendation that nets out of all of this?

Mr. SALOMONE. That is the first part of it. The second part would involve the approach, and that is not necessarily going to an advanced treatment process, when a secondary treatment alternative is more compatible with the town, in terms of operation and maintenance and compatible with not diminishing the water quality of the creek.

Mr. MOODY. You are saying tertiary treatment is unnecessary?

Mr. SALOMONE. I believe so. When you look at the water quality of this creek, when there is water in it, the only reason you have to go to a more advanced system other than the lagoon that we have now is when the flows are at a 20 garden-hose-level.

Mr. MOODY. So there should be some volume trigger within those standards perhaps?

Mr. SALOMONE. Yes, most definitely.

Mr. MOODY. That is an important suggestion, I think worth looking at.

Mr. SALOMONE. And I might add from a generic point of view with respect to the costs, the user charge system should be required to have all the components in it so that when we are looking at the affordability analysis as they do before they approve these types of projects, it has everything it will take to make it a viable system and your point about having collection system, treatment process and water availability should be part of that too because you cannot design a plant unless there is potable water in the area. So the cost to provide those components should be included in the user charge system, and that will help result in representative cost figures.

Mr. MOODY. So you have three. Would you mind writing us, at least me, I would like to see it, a letter just briefly outlining those three generic suggestions now that we have refined what you are getting at. I think your testimony is interesting and extremely provocative. But if you could boil that down to those three points, with

backup argumentation, I would really appreciate seeing in writing the crystallization of what you are saying.

Mr. SALOMONE. I think that the last two pages of my testimony reiterate that, those points, and the documentation provided to the subcommittee would be the backup for those recommendations also. I can supplement it if you feel it would be helpful.

Mr. MOODY. It would be helpful to me if you would just focus on those three things only and give us a brief letter.

Mr. SALOMONE. Yes.

[The following was received for the record:]

LAWRENCE A. SALOMONE
19108 Hempstone Ave.
Poolesville, MD 20837

November 13, 1983

Congressman Jim Moody
1721 Longworth Building
Washington, D.C. 20515

Dear Congressman Moody:

Thank you for your interest in my testimony before the House Subcommittee on Water Resources on November 1, 1983. As you requested, I have prepared an addendum to my testimony that focuses on:

1. Cost - Benefit Analysis,
2. Volume trigger for receiving waters within existing standards,
3. User Charge System required by the Clean Water Act.

The backup argumentation for the generic suggestions that I stated in my testimony on November 1, 1983 is also provided in the addendum.

In preparing my response, I have chosen to emphasize two fundamental points that are essential to achieving the overall goal of the Clean Water Act. They are:

1. The restoration and maintenance of our Nation's waters is an engineering problem that requires efficient and cost-effective <u>systems</u> not just efficient and cost-effective treatment <u>plants</u>;

2. Private and public funds available to restore and maintain our Nation's waters are limited. Consequently, a balance must be achieved between the cost to improve the parts of the wastewater treatment system and the environmental benefit to the receiving surface waters. Otherwise, some environmental hazards will exist uncorrected because of the lack of available funds.

The addendum is divided into the following sections:

1.0 General
2.0 Statement of Problem
3.0 Example of Problem
4.0 Discussion of Solutions
5.0 Recommendations

Based on the argumentation provided in these sections, the generic statements that are suggested for amendments to the Clean Water Act are:

1. Category A - Cost-Benefit Analysis
   A1. "Water quality standards for a receiving water shall be consistent with the size, flow and uses of the receiving water,"

A2. "Water quality monitoring programs shall be established to assess progress towards achieving the goal of the Clean Water Act, to administer priority stream segments and to establish a priority system for restoring and maintaining the Nation's surface waters,"

A3. "Funds appropriated under the Clean Water Act shall not be awarded for a wastewater treatment plant until the necessary collection system improvements are completed if the collection system improvements are needed to provide effective and economical operation of the wastewater treatment plant."

A4. "Flexibility in establishing water quality standards and in defining secondary treatment shall be permitted if undetectable environmental impact will result."

2. Category B - Volume Trigger for Receiving Waters
"For purposes of the Clean Water Act, the term, 'navigable waters' shall exclude waters that do not support a diversified fish, shellfish or wildlife population and have a ten-year, seven-day low flow of less than 0.5 cubic feet per second."

3. Category C - User Charge System Required By the Clean Water Act
"The user charge system required by the Clean Water Act shall reflect all the components that will be necessary to maintain the financial integrity and self-sufficiency of the wastewater treatment system."

I hope that this additional information meets your needs. If I can be of any further assistence, please contact me.

Sincerely,

Lawrence A. Salomone

Lawrence A. Salomone

Addendum
Statement of

Lawrence A. Salomone
Poolesville Area Citizens

For The

House Committee on Public

Works and Transportation

Subcommittee on Water Resources

On The Construction Grants Program

Of The Clean Water Act

November 1, 1983

Addendum

Statement Of

Lawrence A. Salomone
Poolesville Area Citizens

Before The

Subcommittee on Water Resources
House of Representatives

November 1, 1983

1.0 General

This addendum supplements the testimony of Lawrence A. Salomone before the Subcommittee on Water Resources, House of Representatives on November 1, 1983, and it should be inserted after line 2961 on page 126 of Mr. Salomone's testimony. It is prepared in response to a request made by Congressman Jim Moody during the hearing. The addendum focuses on generic suggestions made as part of the testimony of Mr. Salomone that involved:

1. Cost-Benefit Analysis,
2. The problems associated with constructing a treatment plant before major inflow/infiltration problems in the collection system are solved,
3. Volume trigger for receiving waters within existing standards, and
4. User charge system required by the Clean Water Act.

The generic suggestions and the backup argumentation that were requested are provided in the sections that follow.

2.0 Statement of Problem

The overall goal of the Clean Water Act is "to restore and maintain the chemical, physical and biological integrity of the Nation's waters." To achieve this goal, efficient and cost-effective wastewater treatment systems are required.

The Clean Water Act must reflect the fact that the restoration and maintenance of our Nation's waters is an engineering problem that requires efficient and cost-effective systems not merely efficient and cost-effective wastewater treatment plants. Wastewater treatment systems consist of:

1. Potable water that becomes wastewater,
2. Collection system for wastewater,
3. Treatment plant to process wastewater, and
4. Surface water to receive effluent from the treatment plant.

The efficiency and effectiveness of the wastewater treatment system is dependent on the efficiency and effectiveness of its components. Also, it is important to understand that the funds available to improve our Nation's wastewater treatment systems are limited.

Therefore, a balance between the cost to improve the parts of the wastewater treatment system and the environmental benefits to the receiving surface water must be achieved. Otherwise, some environmental hazards will exist uncorrected because of the lack of available funds. Some of the post mortems performed on towns with federally-funded defective treatment plants and/or long-term financial burdens clearly show that these fundamental points are not adequately reflected in the law and understood by the EPA and the States which are asked to enforce the law.

3.0 Example of Problem

The Poolesville, MD case history illustrates the importance of using a systems approach to improve wastewater systems and of achieving a balance between the cost to improve a wastewater treatment system and the environmental benefit to the receiving water. Consider the existing Poolesville Wastewater Treatment System and the deficiences in the approach funded by the EPA and the State of Maryland:

Potable Water Supply

Description - There is a shortage of available potable water to meet the needs of the Town of Poolesville (Pop. 3500). The Town needs 3 to 5 wells and a one million gallon water storage tank to meet the design flow of the treatment plant funded by the EPA and the State of Maryland. All efforts by the Town Board to obtain federal funds to expand the water supply system have failed.

Approach - The EPA and the State of Maryland jeopardized further the health and safety of current residents by funding a treatment plant with its demand for twice as much water as is currently available. Also, the EPA and the State of Maryland refused to include the costs to expand the water supply system in the affordability analysis required for the new treatment plant. The affordability analysis was therefore performed using unrealistic cost figures.

Collection System

Description - The Poolesville collection system has a major inflow and infiltration problem (i.e., 1 million gallons per day during severe storms -- three times the normal flows to the existing treatment plant). The ability of the existing treatment plant to meet its effluent discharge limitations is affected significantly by the inflow/infiltration problem. The cost to rehabilitate and upgrade the collection system has been estimated to be $2,447,000.

Approach - The new treatment plant has been designed for an 85% reduction in the inflow/infiltration rate. Also, the new treatment plant is planned for construction

before the major inflow and infiltration problem of the collection system is solved. By not requiring that the collection system improvements be made before the new treatment plant is constructed, the EPA and the State of Maryland may find that the new treatment plant is oversized if the reduction in the inflow/infiltration rate is achieved or undersized if the reduction in the inflow/infiltration rate is not achieved.

Treatment Plant

Description - The Town of Poolesville is currently using a lagoon to treat its wastewater. Improvements to the existing lagoon to satisfy the required effluent discharge limitations were recommended by the previous engineering consultant to the Town. This approach was less costly (i.e., less costly to build and less costly to operate and maintain).

Approach - The EPA and the State of Maryland supported an inappropriate technology for the Poolesville situation - a sequence batch activated sludge system. The selection of an activated sludge treatment process is too sophisticated and too costly to operate and maintain for a small town such as Poolesville, MD. Furthermore, the environmental benefits to the receiving water, Dry Seneca Creek, have not been demonstrated when an activated sludge treatment process is used.

Receiving Surface Water

Description - The Poolesville treatment plant discharges its effluent into an intermittent creek named Dry Seneca Creek. Dry Seneca Creek as the name implies is dry during periods of drought. During non-drought periods, seven years of water quality data show that its water quality is above existing water standards. Background pollutants from neighboring farms and septic systems (non-point sources) cause at times the water quality to be lower upstream than downstream from the existing Poolesville treatment plant. This suggests that the water quality of Dry Seneca Creek may not be significantly improved by constructing a new treatment plant in Poolesville, Md. A large imbalance exists between the high costs of the new tertiary treatment plant and the non-existent or minor environmental benefit to Dry Seneca Creek.

Approach - The EPA and the State of Maryland ignored the size, flow, water quality and uses of Dry Seneca Creek when it established effluent discharge limitations for the Poolesville treatment plant. It gave equal priority to Dry Seneca Creek and the Potomac River and set a design condition based on a theoretical model that was inappropriate for an intermittent creek. For the ten-year, seven-day low flow condition the waste

stream from the Poolesville plant constitutes essentially all of the flow for the creek. The goal of fishable/swimmable for Dry Seneca Creek during the ten-year, seven-day low flow condition is meaningless, and it results in a more costly, inappropriate technology to be used in Poolesville, MD. If the EPA and the States are to get the most environmental benefit for the dollar and prevent environmental hazards from existing because of the lack of funds, this imbalance(among the use of the creek, environmental goal and cost)cannot be tolerated.

4.0 Discussion of Solutions

In 1972 Congress made the fundamental decision that water pollution control efforts should be based primarily on technology-based effluent standards. Water quality standards, reflecting quality of receiving waters, were relegated to a secondary role. While a technology - based standard is easier to administer, this approach, that does not consider the size, flow, water quality and uses of the receiving body of water, can result in the costs and environmental benefits being significantly out of balance. This imbalance can cause environmental hazards to exist because of the lack of funds.

The issue should be seen not in terms of whether water quality standards should replace technology - based standards but rather in terms of the extent to which the two basic philosophies can complement each other. Considering this and the importance of using a systems approach to restore and maintain the integrity of our Nation's waters, the following comments are made for each of the parts of a wastewater treatment system:

Potable Water Supply

A test should be added to ensure that potable water is available to meet the design flow of the proposed wastewater treatment plant. If sufficient water is not available, but the water supply will be expanded to meet the design flow of the proposed treatment plant, the costs to expand the water supply system should be included in the affordability analysis and the user charge system required by the Clean Water Act.

Collection System

In Poolesville, Md and in many regions of the Nation, the major problem in meeting local water pollution needs lies not in treatment plant construction but in upgrading their sewage collection systems. EPA estimates that leakage into collection pipelines constitutes 25% of the total existing flow into the Nation's treatment plants. Therefore, sewer rehabilitation, combined sewer overflow correction and sewer collection systems should remain as categories for funding under the Clean Water Act. Also, necessary collection system improvements should be made before the construction of a treatment plant if the improvements are needed to provide effective and economic operation of the proposed treatment plant.

Treatment Plant

Considering the small percentage of projects funded under the Construction Grants Program that are actually complete and contributing to water quality improvement, a test should be added to ensure that the costs and benefits of using the proposed technology are in balance. The Clean Water Act should be amended to provide that compliance orders shall include a demonstration that the environmental benefits of using the proposed technology are in line with the costs (i.e., the costs to build and the costs to operate and maintain year after year).

Receiving Surface Water

The 1972 Water Pollution Control Act called for all the Nation's streams to be "fishable and swimmable where achievable" by 1983. In practice, the "where achievable" phrase is ignored. The EPA and the States should be required to make the right selection of stream uses and that these uses are realistic and attainable uses.

The size, flow and uses of the receiving body of water should be considered in setting effluent discharge limitations and establishing priority lists for federal funds appropriated under the Clean Water Act. For example, intermittent surface waters should be excluded from the Clean Water Act unless the surface water supports a diversified fish, shellfish or wildlife population.

Water quality data should be used, if available, and good water quality monitoring programs should be established to keep decision makers from making costly and inappropriate decisions based on the lack of information or on misinformation. The EPA and/or the States should be required to survey streams to identify priority surface waters.

Accountability

Future costs of wastewater treatment plants are frequently underestimated. To correct this problem the user charge system and the affordability analysis required by the Clean Water Act should reflect all the components that will be necessary to maintain the financial integrity and self-sufficiency of the wastewater treatment system. The user charge system and the affordability analysis should reflect: the debt service and the operation and maintenance (O&M) costs to expand the local potable water system to meet the design flow of the proposed treatment plant, the cost of collection system improvements, remaining debt service for old treatment plant, debt service and O&M costs for new treatment plant, the cost of sludge disposal and the cost to monitor the water quality of the receiving surface water.

The sequence for funding remedial steps to improve and upgrade the various parts of the wastewater treatment system should be an important consideration when determining eligibility for funds appropriated under the Clean Water Act. Funding priorities should be established using a systems approach.

5.0 Recommendations

Based on the argumentation provided in the previous sections, the generic statements that are suggested for amendments to the Clean Water Act are:

1. Category A - Cost-Benefit Analysis

   A1. "Water quality standards for a receiving water shall be consistent with the size, flow and uses of the receiving water,"

   A2. "Water quality monitoring programs shall be established to assess progress towards achieving the goal of the Clean Water Act, to administer priority stream segments and to establish a priority system for restoring and and maintaining the Nation's surface waters,"

   A3. "Funds appropriated under the Clean Water Act shall not be awarded for a wastewater treatment plant until the necessary collection system improvements are completed if the collection system improvements are needed to provide effective and economical operation of the wastewater treatment plant,"

   A4. "Flexibility in establishing water quality standards and in defining secondary treatment shall be permitted if undetectable environmental impact (degradation) will result."

2. Category B - Volume Trigger for Receiving Waters

   "For purposes of the Clean Water Act, the term, 'navigable waters' shall exclude waters that do not support a diversified fish, shellfish, or wildlife population and have a ten-year, seven-day low flow of less than 0.5 cubic feet per second."

3. Category C - User Charge System Required By The Clean Water Act

   "The user charge system required by the Clean Water Act shall reflect all the components that will be necessary to maintain the financial integrity and self-sufficiency of the wastewater treatment system."

This concludes my statement.

Mr. ROE. We want to thank you very much for your valued testimony. It has been enlightening to the committee.

Mr. SALOMONE. We really appreciate the support you have given.

Mr. ROE. And you have some work that you have to do now.

Our next witness is Mr. Robert R. Perry, assistant executive director, Water Pollution Control Federation, accompanied by Mr. Andrew Stevenson, manager, public affairs.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

Prepared Statement of Robert R. Perry, Assistant Executive Director, Water Pollution Control Federation

INTRODUCTION

Good morning, Mr. Chairman, and members of the water resources subcommittee.

It is an honor to appear before you this morning regarding amendments to the Clean Water Act. The Water Pollution Control Federation (WPCF) appreciates your interest in its viewpoints.

Mr. Andrew Stevenson, our government affairs manager, is with me this morning.

REVIEW OF EARLIER TESTIMONY

On August 2nd, WPCF member Paul Freese appeared before this committee to express support for programs authorized by the Act. Table 1 of this statement summarizes WPCF's recommendations in each case.

During his testimony, Mr. Freese was asked several questions by Representatives Ferraro and Stangeland. Detailed answers to those questions were supplied, following hearing. Extra copies of those replies were presented to your staff earlier this morning. We have taken the liberty of highlighting some of the statements in those two letters because I will refer to them in my concluding remarks.

NEW POINTS FOR THE COMMITTEE'S CONSIDERATION

This morning I would like to briefly address 4 issues. I will explain a little more fully WPCF's position on the 2 questions of urban and rural nonpoint source pollution. I will also describe the Federation's position on the industrial pretreatment program. And finally, I will close with a suggestion about the municipal construction grants program.

Urban Nonpoint Source Pollution

For many years, congressional supporters of the clean water program have been concerned about the significance of urban nonpoint source pollution. There are two forms of urban NPS: stormwater flows and combined sewer overflows. Both discharge large quantities of pollutants into receiving waters.

Successive U.S. EPA needs surveys have refined the estimated costs of controlling stormwater. Table 2 shows EPA estimates for controlling discharges from combined sewer overflows and from separate storm sewers. By any measure, conventional treatment of stormwater would require an extremely large sum of money...approximately 4 times the cost of our remaining conventional needs.

Congress needs to know where urban NPS is a serious national problem, and how to best control it. We are still waiting for conclusive answers to all of these questions. At the present time, federal funds and programs supporting urban NPS control match the relative national importance of the problem.

U.S. EPA's Nationwide Urban Runoff Program provides 3 reasons why more information on urban NPS is needed:

1. No definite yardstick. There are no formal "wet weather" water quality criteria for stormwater pollutants.[1]

2. No concensus on how to use a yardstick. Individual analyses using potential measures of water quality have not yet been completed. We do not know if the measures are valid or accurate.[2]

3. No way to make reliable generalizations. It is not yet possible to generalize from the few studies that have been done, because the important stormwater factors vary greatly from site to site.[3]

Highlights of the preliminary NURP report are summarized in the August 2nd WPCF statement. Highlights of the draft version of the final report are contained in Table 3 of this statement. They support the conclusion that urban NPS merits further study.

In view of these points, WPCF suggests that this committee authorize continued research into the urban nonpoint source pollution issue and defer any legislative changes until we have answers to three questions:

Where is urban stormwater a pollution problem?
When is it a problem?
What can be done to correct the problem?

Rural Nonpoint Source Pollution

Three years ago, WPCF examined 3 major sources of rural nonpoint source pollution: (1) nutrients from conventional farming; (2) sediments and salts from irrigated farming; and (3) sediments from commercial forestry operations. After examining the evidence, WPCF concluded a national program of control could not be effectively developed without more information on the phenomena. Copies of the position were supplied to this committee on August 2. We believe the conclusion is still valid today.

With few exceptions, rural nonpoint sources are not susceptible to "end-of-the-pipe" treatment. Most controls have to be applied by the people whose activities create this type of pollution--tree harvesters, farmers, ranchers,

---

[2] NURP, Volume I; Chapters 4 and 5.

[3] NURP, Volume I; pp. 4-5 through 4-7.

and others. Therefore, successful control programs demand much more person-to-person communication than point source programs. Instead of dealing with one metropolitan treatment authority, it is necessary to deal with many individuals.

Federal agencies can and do provide valuable technical assistance. They also help finance research and demonstration projects. Section 208(j) authorizes the Secretary of Agriculture to conduct such a program, for example. WPCF suggests that no further federal initiatives are needed at this time, given the range of programs that are already operating.

The state of our knowledge about rural nonpoint sources is summarized in the conclusion to our position paper:

> "NPS pollution may be the most difficult form of surface water pollution to control. Our knowledge of when and where it makes serious contributions to local water problems is spotty. It is hard to construct useful generalizations about sedimentation or pesticide problems because the unique characteristics of each situation seem to determine the solutions posed for each case. Part of our overall problem with non-point-sources is ignorance: we need to know more about the pollutants, how they move, what they do while they are moving. We are not completely sure how to measure them. We do not agree on how they can be modeled mathematically. Another part of our problem is social, or perhaps political: we do seem to know enough to say at this point that building treatment facilities is not an economical option."

One other aspect of the rural nonpoint source problem deserves this committee's consideration. In the Federation's August 2nd testimony, we stated that there are many situations in which the potential benefits of NPS control are mutually exclusive. The fact that you have to trade one benefit (or set of benefits) for another adds complexity to the problem of creating a federal control program. Who decides what benefits to promote and which to forego? Here are two examples of the kinds of trade-offs that have to be made.

Groundwater recharging is one benefit. Slowing the rate of "eutrophication" or aging in lakes, ponds, and streams is another. Still a third benefit is maintaining a varied streambank environment of flora and fauna for recreation purposes. Yet, not all of these can be obtained in each case where nonpoint source controls are needed.

Recharging groundwater requires reducing the amounts of surface runoff that travel overland, through a watershed, and into a stream. Reduced surface runoff means streambank environments that depend on water from this source will change. It can also mean that eutrophication in the receiving waters will be faster because the rate and volume of replenishment from overland flows has decreased. Thus there are situations in which a choice can be made to <u>either</u> recharge groundwater <u>or</u> control eutrophication and promote <u>streambank</u> ecology. The choice here is best made at the local, regional, or state level, not at the federal level.

The second example is a bit more complicated. In certain areas, irrigated agriculture depends on controling the level of salts in soils and streams. If the level of salinity in the stream is a problem, control can be effected by making sure more of those salts stay in the soil.

But keeping more salts in the soil may reduce the yield of the crops being grown, if they are sensitive to salt. Controlling the flows that return to a stream from irrigated agriculture may require changing the crops grown in an upstream area so that crops grow" in a downstream area can continue to flourish.

As in the first example, this kind of trade-off is a difficult one to make. It involves the interests of upstream and downstream beneficiaries. Where acutely important, it usually leads to litigation if negotiations do not produce a satisfactory solution. I submit that decisions of this type cannot be made productively at the federal level, involving as they do questions of state water law.

I have used these examples to illustrate the complexity of the rural nonpoint source problem with which it is very difficult to deal. Looking at rural nonpoint source pollution in the broadest perspective, it appears that the most effective control programs will have to be fashioned from the bottom up. That is, they will be crafted out of agreements at the local, regional, and state level, rather than being imposed from the federal level.

Therefore, WPCF recommends continuing the assistance now provided to states. State agencies are best situated to develop the actual controls or to encourage their development at lower levels of government.

INDUSTRIAL PRETREATMENT

This committee has followed the difficult history of industrial pretreatment since 1970. Implementing pretreatment programs that meet the requirements of federal law has been extremely difficult. In fact, one of the most comprehensive pretreatment programs was actually in place and operating before the 1972 Clean Water Act was passed. So the law may have complicated things. I am referring to the program designed and operated by the East Bay Municipal Utility District in Oakland, California.

Why has this provision of the law been so difficult to implement? You have testimony from a long list of witnesses regarding the problems they have had to wrestle with while working on the pretreatment issue. I cannot say that WPCF has a miracle solution to offer you this morning. Instead, I wish to suggest that this committee consider some fundamental revisions to the law. If enacted, these revisions could remove many of the stumbling blocks to industrial pretreatment.

Once again, the Federation's suggestions are based on a position paper adopted in October of 1981. Here are four steps that Congress could take to simplify the pretreatment concept and speed the development of local programs:

No. 1: Create a separate class of direct dischargers for municipal treatment agencies. Apply the principle of parity among dischargers to that class, as compared

with other classes of direct dischargers, rather than to industrial customers of POTWs.

No. 2: Authorize POTWs to develop their own pretreatment standards for industrial customers. Do not require federal standards for indirect dischargers.

No. 3: Authorize POTWs to treat existing and future industrial customers equally, rather than requiring different control levels for new dischargers.

No. 4: Revise enforcement and performance requirements in the law to lay those responsibilities squarely on the shoulders of the municipal authority. Local ordinances for treatment system discharges can and will be strengthened to reflect federal concerns. Local authorities will be able to implement their programs in a step-by-step fashion, controlling the most pervasive pollutants first.

I realize the changes WPCF urges you to consider are far-reaching. I know that amending the law on such a controversial issue will be time-consuming. Yet taking such action would, we believe, have a better chance of breaking the 4-way stalemate between regulatory authorities, treatment agencies, industrial dischargers, and environmental activists than continuing on our present course.

FINANCING MUNICIPAL TREATMENT

To conclude the Federation's testimony, allow me to return to the subject of POTW financing. In the Federation, we use this term to refer to the larger context in which the municipal construction grant program operates. We do so because we believe that Congress's original intention in creating the grants program was to make financing long-term POTW operations easier through a short-term program of federal grants.

Our position on POTW financing is explained in detail in the 1981 position paper and the 1982 sequel to that position. In fact, it was a query from this committee in the fall of 1981 that led to the adoption of the 1982 sequel. Thus the members of this panel should be complimented for stimulating WPCF to elaborate on its original position.

After our August 2nd appearance, we sent letters to Representatives Ferraro and Stangeland summarizing the position and our rationale for it. We have taken the opportunity of this testimony to provide each of you with an extra copy of those letters. The copies are highlighted so that you can scan to the paragraphs that state the essence of our position.

As far as we know, only the Water Pollution Control Federation has taken Congress's original intentions seriously enough to address the question, "How do we complete the construction grants program?" I have recently learned that the National Society of Professional Engineers (NSPE) has acknowledged, in principle, that this program should not be a perpetual subsidy to treatment agencies. We congratulate NSPE for taking this position.

Now, however, we find that many of the organizations appearing before this committee support expanding annual authorizations for the grants program. The level of $5.0 billion a year has been mentioned as an ultimate target for funding.

WPCF believes the program needs to be completed. No one should construe our position on the issue to mean that it is not worth additional authorizations.

The grants program should contribute to the long-term goal of creating self-supporting municipal utilities. Pages 2 through 4 of our September 9th letter to Representative Stangeland document the House's concern with this long-term goal. We believe this goal is in the national interest. It focuses efforts within the grants program on a definite end. It describes a state of responsibility and freedom at the local level that is in the best interests of each community. Through this goal the national and the local interests coincide.

IN CONCLUSION

On behalf of the Water Pollution Control Federation, I appreciate the opportunity to appear before this committee and present our thoughts on programs of the Clean Water Act. Should you have any additional questions for us, we would be pleased to submit corroborating material in person or in writing. Thank you very much.

TABLE 1: Synopsis of WPCF Testimony from August 2, 1983

Subject	Recommendation
Research, Development, and Training	Continue authorizations for the programs in Sections 104, 106, 112, and 517.
Clean Lakes	Continue authorizations for the Clean Lakes Program of Section 314.
Municipal Grants	Set a completion schedule for the program. Endorse the concept of self-supporting municipal treatment. Reaffirm congress's originial intention for the grants program to be a "one time only" opportunity.
Areawide Planning	Continue authorizations for regional and areawide planning programs covered by Section 208.
Nonpoint Source Pollution	Rural nonpoint sources: collect and analyze the information we already have. Find out more about potential control programs and techniques. Urban nonpoint sources: support completion of EPA's Nationwide Urban Runoff Program. Decide whether additional legislation is needed on the basis of conclusions from that program.
Effluent Limitations	Extend the promulgation deadline past the current point of July 1, 1984. Base the exact length of the revised extension on the resources Congress directs to spend on promulgation.
Effluent Compliance	Extend the compliance deadlines for direct industrial dischargers. Consider starting compliance period with promulgation date or with permit revision date.
Ocean Discharge Waivers	Consider ocean discharge of effluents as an alternative to full secondary treatment. Make decisions on the basis of environmental merit.
Water Quality Standards	Consider codifying current regulations only after negotiations between Hill staff experts and EPA regulators have been concluded. The prospect for writing mutually acceptable language appears good.
NPDES Permits	Allow partial delegation of the NPDES permit program. Authorize the use of 10-year permits, subject to the standard re-opener clause.

TABLE 2: Urban Runoff Control Cost Estimates for 1983 and 2000 (in billions of dollars)

Need	1983 Estimate	2000 Estimate
Combined sewer overflows	35.74	35.74
Stormwater runoff	93.21	?
Total	128.95	?

Conclusions:

1. The total estimated need for urban nonpoint source control in 1983 is nearly four times as great as the estimated needs for conventional treatment in urban areas. Needs for conventional treatment in 1983 are $32.84 billion.

2. Since the projected population increase in the U.S. between 1982 and 2000 is 279 million people, the growth of urbanized land can be expected to create a Year 2000 estimated need equal to or greater than the 1983 estimate.

TABLE 3: Selected Conclusions from the NURP Final Report (draft)

No. 1	The storm events which produce urban runoff occur about 100 times each year. They are in progress somewhere in the United States about 10% of the time, at any given time.
No. 2	Regarding drinking water degradation, periodic, short-term exceedance of the 50 micrograms per liter criterion could be tolerated without causing significant health risks.
No. 3	Exceedances that last for 6 to 10 hours (the average duration of a storm) and only happen 2 or 3 times a year do not impair the beneficial use of potable water, even though they do violate the official standard.
No. 4	The general effect of urban runoff on bays and estuaries can now be analyzed at 4 NURP sites: Long Island, NY; Washington, DC; Durham, NH; and Tampa, FL. No results are available yet.
No. 5	The effect of runoff on lakes can be analyzed at 8 NURP sites, using the screening and assessment procedures developed by the program.
No. 6	The effect of runoff on groundwater cannot be studied until screening procedures for groundwater aquifiers are developed.
No. 7	Stormwater management planning need not involve expensive technical studies. A general program can be developed with readily available data and outside experts, if needed. Detailed technical studies can then be done for specific issues and problems. Effective local planning can alleviate the need for costly remedial public works.

Mr. ROE. Please proceed.

TESTIMONY OF ROBERT R. PERRY, ASSISTANT EXECUTIVE DIRECTOR, WATER POLLUTION CONTROL FEDERATION, ACCOMPANIED BY MR. ANDREW STEVENSON, MANAGER, PUBLIC AFFAIRS

Mr. PERRY. Thank you, Mr. Chairman.

Good afternoon, Mr. Chairman, and members of the Water Resources Subcommittee.

It is an honor to appear before you this afternoon regarding amendments to the Clean Water Act. The Water Pollution Control Federation appreciates your interest in its viewpoints.

On August 2, WPCF member Paul Freese appeared before this committee to express support for programs authorized by the act. Table 1 of this statement summarizes WPCF's recommendations in each case.

During his testimony, Mr. Freese was asked several questions by Representatives Ferraro and Stangeland. Detailed answers to those questions were supplied, following the hearing. Extra copies of those replies were presented to your staff earlier this morning. We have taken the liberty of highlighting some of the statements in those two letters because I will refer to them in my concluding remarks.

This afternoon I would like to briefly address four issues. I will explain a little more fully WPCF's position on the two questions of urban and rural nonpoint source pollution. And then I would also touch on industrial pretreatment and the municipal construction grants program.

First of all, urban nonpoint source pollution.

For many years, congressional supporters of the clean water program have been concerned about the significance of urban nonpoint source pollution. There are two forms of urban nonpoint source pollution: Storm water flows and combined sewer overflows. Both discharge large quantities of pollutants into the receiving waters.

Successive U.S. EPA needs surveys have refined the estimated costs of controlling storm water. Table 2 shows EPA estimates for controlling discharges from combined sewer overflows and from separate storm sewers. The total cost is approximately $129 billion. By any measure, conventional treatment of storm water would require an extremely large sum of money—approximately four times the cost of our remaining conventional needs.

The U.S. EPA nationwide urban runoff program provides three reasons why information on urban NPS is needed. And, by the way, this latest report from EPA came out on this within the last 2 weeks. It is a final report of the nationwide urban runoff program, and an excellent report.

No. 1, there is no definite yardstick. There is no formal wet weather water quality criteria for storm water pollutants. We establish and measure water quality on the basis—primarily—of dry weather flow.

There is no concensus on how to use a yardstick. Individual analyses using potential measures of water quality have not yet been completed. We do not know if the measures are valid or accurate.

No. 3, there is no way to make reliable generalizations. It is not yet possible to generalize from the few studies that have been done, because the important storm water factors vary greatly from site to site.

In view of these points, WPCF suggests that this committee authorize continued research into the urban nonpoint source pollution issue and defer any legislative changes until we have answers to three questions:

Where is urban storm water a pollution problem?

When is it a problem?

And what can be done to correct the problem?

The second item, rural nonpoint source pollution.

Three years ago, the federation examined three major sources of rural nonpoint source pollution: First, nutrients from conventional farming; second, sediments and salts from irrigated farming; and third, sediments from commercial forestry operations. After examining the evidence, the federation concluded a national program of control could not be effectively developed without more information on the phenomena.

Federal agencies can and do provide valuable technical assistance. They also help finance research and demonstration projects. The Soil Conservation Service, Department of Agriculture agencies, have long had effective programing in rural nonpoint source pollution.

Section 208(j) of the Clean Water Act authorizes the Secretary of Agriculture to conduct such a program, for example. The federation suggests that no further Federal initiatives are needed at this time, given the range of programs that are already operating.

The state of our knowledge about rural nonpoint sources is summarized in the conclusions to our position paper:

> NPS pollution may be the most difficult form of surface water pollution to control. Our knowledge of when and where it makes serious contributions to local water problems is spotty. It is hard to construct useful generalizations about sedimentation or pesticide problems because the unique characteristics of each situation seem to determine the solutions posed for each case. Part of our overall problem with non-point sources is ignorance: We need to know more about the pollutants, how they move, what they do while they are moving. We are not completely sure how to measure them. We do not agree on how they can be modeled mathematically. Another part of our problem is social, or perhaps political: We do seem to know enough to say at this point that building treatment facilities is not an economical option.

What we are saying, Mr. Chairman, is that we feel that the law as it now stands, the Clean Water Act, has sufficient language to do the things that are necessary in rural nonpoint pollution.

Industrial pretreatment. Why has this provision of the law been so difficult to implement? We have been talking about this since 1970, when Congress was first concerned with Public Law 92-500.

You have testimony from a long list of witnesses regarding problems they have had to wrestle with while working on the pretreatment issue. I cannot say that WPCF has a miracle solution to offer you this afternoon. Instead, I wish to suggest that this committee consider some fundamental revisions to the law. If enacted, these

revisions could remove many of the stumbling blocks to industrial pretreatment.

Once again, the federation's suggestions are based on a position paper adopted in October 1981. Here are four steps that Congress and/or EPA could take to simplify the pretreatment concept and speed the development of local programs:

First, create a separate class of direct dischargers for municipal treatment agencies. Apply the principle of parity among dischargers to that class, as compared with other classes of direct dischargers, rather than to industrial customers of POTW's.

Second, authorize POTW's to develop their own pretreatment standards for industrial customers. Do not require Federal standards for indirect dischargers.

And we recognize all the disagreement with that position—arguments against that position.

Third, authorize POTW's to treat existing and future industrial customers equally, rather than requiring different control levels for new dischargers.

Fourth, revise enforcement and performance requirements in the law to lay those responsibilities squarely on the shoulders of the municipal authority. Local ordinances for treatment system discharges can and will be strengthened to reflect Federal concerns. Local authorities will be able to implement their programs in a step-by-step fashion, controlling the most pervasive pollutants first.

And the fourth item is financing municipal treatment. We gave you considerable information and testimony on this in August. Also in our letters to Ms. Ferraro and Mr. Stangeland we dealt at length on this issue.

After our August 2 appearance, we sent those letters.

I will not go into this further, although I would be glad to discuss it with you or answer questions on our funding position. I guess the basis of our funding position is stated in the first sentence of the third paragraph of page 7 of our testimony. The grants program should contribute to the long-term goal of creating self-supporting municipal utilities.

The federation's positon for many, many years has been that water pollution control, collection, and treatment facilities, should be self-supporting utilities.

Thank you, Mr. Chairman. I will be glad to take any questions.

Mr. ROE. I want to thank you very much for your testimony.

The gentleman from Oregon.

Mr. SMITH. Thank you, Mr. Chairman.

I am wondering, for someone like yourself who believes from the bottom up approach is the best, how that can actually take place, recognizing the political and economic restraints of the communities; how can a bottom up approach be effective?

Mr. PERRY. I think the political constraints may be the most difficult, and I think those are the constraints that you need to deal with. But I think, as a professional organization, we need to state what we feel is the best way that these things can be done.

The public needs to understand the true cost of water pollution control. I think if this were so the problems that were related by the previous witness would not occur. It is difficult to understand why there should be a difference between the cost to the customer

of water pollution control versus the cost of water, electricity, gas, telephone, and all of the utilities that are required in a home today, and why it is absolutely necessary for the Federal Government to fund a portion of a water pollution control program. The Federal Government has been funding this program since, I believe, 1956. Now if the intent of the Federal program is to provide municipalities with a chance to get caught up, and from then on they are on a self-supporting basis, then, since 1956, we have not made much progress. What the federation is saying is that Congress should make a determination that there will be an end to this program, and this is when it will end, and this is how it will end. We have given you a suggestion on how this might be done at, by the way, at the request of this committee. That is where we need to go.

Mr. SMITH. Thank you. You know, I am very impressed with your statement about agricultural nonpoint pollution. That is the first time I have seen it identified in specifics. We have had a lot of testimony that we ought to attempt to eliminate nonpoint pollution. And I think you have delineated between urban and rural nonpoint pollution in an excellent way.

That brings me to the question, in a response to a letter or your letter to Mr. Freese's question, you recommended a center for nonpoint source information. Do you want to expand upon that thought?

Mr. PERRY. I think the idea is simply to bring together the information that has been gathered, the knowledge that has been gathered in State agencies through the years and in our own Federal departments. This is especially true of urban nonpoint as well as rural nonpoint; to bring this together in some manner and to coordinate a national effort on finding answers to these problems.

Again, we have the problem at the Federal level, where we have the Department of Agriculture dealing with this, EPA dealing with this and other agencies dealing with this, and we need to bring this effort together and focus on the problems that confront us all.

Mr. SMITH. You are thinking of a federally funded point or commission or center?

Mr. PERRY. Probably, yes. I think it would have to be a Federal effort.

Mr. SMITH. A federally funded commission to bring all the information together?

Mr. PERRY. Yes. I am not sure commission is the right word, but it should be a federally funded effort of some kind.

Mr. SMITH. Do you have any idea what kind of expenditures?

Mr. PERRY. No.

Mr. SMITH. Thank you, Mr. Chairman.

Mr. ROE. The gentleman from Wisconsin.

Mr. MOODY. Thank you for your very interesting testimony.

The last two witnesses, I am sure you found as interesting as I did, but there we have a case where the bottom up decisionmaking is not working very well. You just suggest bottom up decisionmaking and they are complaining that EPA is not correcting false information that is being disseminated, unless somehow the Inspector General's information can be transmitted—perpetrated through the system. But bottom up decisionmaking, here we have got a

group of decisionmakers who were basically oriented toward growth, in answer to growth proponents in this community, and they are way overbuilding, if their statements are correct. I do not know whether bottom up decisionmaking is necessarily the answer for nonpoint. But I think you would agree, whether or not you agree with that, that local decisionmaking may not work for nonpoint because you may have three or four local jurisdictions, or even State jurisdictions, emptying into the same estuary or the same basin or the same bay. And if you let each set their own decisionmaking, the poorest one gets the freest ride—the one who does the least gets the free ride—Maryland and Virginia dumping, a nonpoint source going into the Potomac Bay, I mean the Chesapeake Bay. We had testimony last week that described this and we had some estuary experts here saying you just cannot let everybody make their own decisions because there is always this temptation to do less and, therefore, the culmination of that is everyone does less. So if my pollutants pollutes your body of water, I am going to be—my incentive is to undercontrol pollution on a nonpoint basis. How do you answer that?

Mr. PERRY. My response would be that in the nonpoint area of pollution, I think the top of the pyramid, so to speak, needs to be the State and interstate agencies. I agree with you that you cannot expect the local communities to deal with nonpoint source. With enforcement, and especially in rural nonpoint source pollution control, the State has got to take a strong hand. All of this in the end comes back to the water quality standards that are going to be required, and how you are going to meet these standards. But in nonpoint, I think State agencies and interstate agencies are the ones that are most familiar with the problems and are most able to deal with them.

Now, the national research effort and the bringing together of all this information that we discussed is a national responsibility.

Mr. MOODY. If I may interrupt you. If the State is the right unit for decisionmaking on nonpoint, then how do you answer the Chesapeake Bay problem?

Mr. PERRY. That would be an interstate situation. There are interstate situations.

Mr. MOODY. How do you get teeth on interstate enforcement?

Mr. PERRY. That is what we need to find out, because very few, if any, of the interstate agencies that we now have have any teeth.

Mr. MOODY. Are you recommending teeth? Your testimony, which I found very interesting and worthwhile, does not seem to dwell on teeth; it seems to dwell on the need for more research and information.

Mr. PERRY. You are correct, it does not deal on enforcement.

Mr. MOODY. But should there not be?

Mr. PERRY. There should be.

Mr. STEVENSON. If I may, Congressman, one of the problems with enforcement, when you are looking at nonpoint source pollution, is that there are no clear agreements among people within the profession as to what might be the best control methods that can be applied in a particular situation. There is even a lack of concensus when we are dealing with a very small, relatively local situation of nonpoint source pollution. And that kind of a lack of concensus is

multiplied many times when you are dealing with something that is in the order of an estuary-wide problem. So what we have tried to describe in our testimony is a path by which if we can bring all of the information together, we may be able to make it possible to decide what the proper control measures are. Once you have got that decision, then you have a basis for extending yourself more strongly into the enforcement area and saying people agree that this is the proper way to solve the problem for the Chesapeake Bay, why have you not done so so far? At the moment, if you tried to make that argument, you will find that each side can call well-respected scientific witnesses and dispute the point that the control method you want to enforce is the proper one.

That seems to be our problem.

Mr. MOODY. That is interesting. I think that is going to continue though. Waiting for a concensus is like waiting for a utopia, I do not think we are going to have it, because there are respectable people on both sides, and there will continue to be, on how you solve it, and it will depend on whose ox is getting gored to some extent which witnesses are called up.

But, in the urban area, for point pollution, you finally despair; you have the same analogous disagreements for years on that. Finally, you have come up with set standards and then you guys, you persons locally figure out what your best technology mix or investment or expenditure mix is to solve the problem. We are only going to require that the outfall have a certain standard. We will not try to second-guess your technology. In nonpoint, you really have that in spades, it seems to me, because you have different soil conditions, different climactic conditions, different characteristics of the receiving body of water; you have different kinds of agricultural situations; different crops; different feedlot situations. We are going to have information overload if we try to come up with a national, or even a regional standard on this is the way to solve nonpoint. It seems to me that has always got to be left locally and some tough trade-offs have to be made, but they are going to have to be made locally, because if we make them nationally we are going to definitely be wrong most of the time. But that standards approach, or have an output restraint, an output constraint that water must not fall below a certain level, and how you do it is up to you. If we wait for the concensus and do all the research that you are suggesting, I think we will never get to the end of the tunnel. I am just sharing that with you.

Mr. PERRY. I do not understand how you can put restraints at the national level. As you point out, the problems are so different in State to State and basin to basin. The problems of the West and irrigated agriculture are so much different than in the East that I do not see any way that you can pass national legislation that is going to solve that.

Mr. MOODY. What if you say that runoff standards have to be x, so much oxygen demand, so much particular matter, so much—you know, you set up these constraints and every region, every water basin is forced to come to terms on how to solve it.

With air pollution control, in Wisconsin, we are under air pollution constraints. They do not tell us how to solve it; we have to crack heads to figure out how to get our air pollution down or we

are going to face loss, or potential loss of Federal highway money, and sewer money, but we are going to have to make those tough technological and economic trade-offs. And that is the only way we are ever going to make progress, it seems to me.

Mr. PERRY. I think what you said is correct except we are a long way from being able to do that, and that is the problem. One of the things——

Mr. MOODY. Does your call for action, which is basically a research agenda, really get us ahead; is it really going to move us forward is my question.

Mr. PERRY. I would hope it would, yes, toward finding the answers that you are saying we need.

Mr. MOODY. I guess my response is the answers are going to be so particularistic to every different situation that you are not going to find an answer that we can legislate nationally.

Mr. STEVENSON. I think I understand your line of reasoning, and the federation would agree with your concern that you cannot legislate a national solution to a problem like nonpoint source.

Mr. MOODY. Not the inputs; you might legislate the outputs, the outcomes.

Mr. STEVENSON. Yes. If you have the time, or if the staff has the time, you will find in the EPA study a national urban runoff program, an evaluation of the different control options that are available to deal with urban nonpoint. It is not rural, but urban. And they do present some particular cases in which they have evaluated the practicality of different controls. So there is a basis being put together for people to make those kinds of decisions. I think the thing that concerns the federation the most is whether or not we can actually say that there is a national problem with urban runoff that demands a new Federal initiative, or whether or not the programs that are currently in the law will make it possible for you to address an urban nonpoint source problem if it is a serious one within your area, or within the watershed that you happen to discharge to. And thus far——

Mr. MOODY. The reason, I think, intuitively, I would say the time has come to say yes on that question is that such a large portion of the waters, the ultimate water quality is now determined by nonpoint that we are pressing harder and harder on point solutions, point control solutions, and if we ignore the other, we are, basically, going to be wasting money. It is a diminishing return, so you can press harder and harder on points, but if you do not address nonpoint, you are really not getting much for your dollar. You have got to coordinate those two, so the time has come, I think, to get serious about nonpoint, and I guess that is what I am in a quandary about, how do we get at it?

Mr. STEVENSON. I think most of the people in the federation agree with that, and I am sure the organization would agree with that. There is no doubt that nonpoint sources outside of an urban area, which you seem to be referring to, more rural rather than urban, are a serious problem.

Mr. MOODY. Really both, but, you know——

Mr. STEVENSON. Well, there is one major difference between urban and rural runoff. Urban is much more conducive to conventional treatment technology. In fact, unless you really want to

stretch a point, urban runoff is, basically, can be considered a point source for the objective of solving it or resolving it.

Mr. PERRY. You can capture it easier.

Mr. MOODY. You have it in a pipe from highways and parking lots and so forth.

Mr. STEVENSON. Precisely. There are conveyances that move it to the receiving waters. That is not the case with rural nonpoint sources, in most instances, and that is why we, as an organization, have difficulty recommending to you particular ways to solve rural nonpoint sources.

Mr. MOODY. But equity requires that we try to because it is not fair to ask the urban areas to do more and more and more and ignore the rural.

Mr. PERRY. We would agree with that.

Mr. MOODY. Thank you, Mr. Chairman.

Mr. ROE. OK. Any further questions?

I want to thank you very much for, again, your splendid testimony. We appreciate your expressing your thoughts to us, and we will look into them further.

Mr. PERRY. Thank you, Mr. Chairman.

Mr. ROE. Thank you very much.

Our next and final witness today is Mr. Geoffrey Stengel, Jr., president of the Envirite Corp.

Mr. Stengel, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

PREPARED STATEMENT OF GEOFFREY STENGEL, JR., PRESIDENT, ENVIRITE CORP.

Mr. Chairman, Members of the Committee, my name is Geoffrey Stengel, Jr. I am President of Envirite Corporation, a Pennsylvania-based firm that specializes in converting hazardous metal finishing wastes into nonhazardous materials. I am pleased to testify on the reauthorization of the Clean Water Act, and in support of H.R. 3282, introduced by Chairman Howard.

On September 15, 1983, Envirite withdrew its Notice-of-Intent to build a new hazardous waste treatment facility in Eastern Massachusetts. The reason we withdrew at this time is that there does not appear to be a clear prospect of sufficient business developing in Massachusetts to justify a new plant, although there certainly are prospects. The major issue is uncertainty on our part as to the success of state and local efforts to establish and enforce treatment standards limiting the discharge of industrial pollutants into the sewer system serving the greater Boston area. Any privately-owned waste treatment facility would find it difficult to compete with a publicly-owned outlet for untreated wastes.

The Massachusetts Department of Environmental Quality Engineering and the Metropolitan District Commission have been striving to develop an effective pretreatment program for industrial dischargers that will ultimately eliminate or greatly minimize the flow of contaminated material into the bay. Indications are that progress is being made, and that further progress can be expected over the next several years. Nonetheless, enforcement still needs to be strengthened considerably.

In our judgment, therefore, it is premature for Envirite to commit to a Massachusetts facility at this time. While it can be argued that the siting application process may require at least

two years and that by then the enforcement program will be significantly improved, we simply cannot justify that kind of financial risk at present. Accordingly, Envirite withdrew its notice-of-intent.

Much national public attention has been focused this year on the need to clean up hazardous waste sites created in the past. Relatively little attention has been paid to the fact that existing laws and regulations continue to allow as much as 80% of all hazardous wastes to be landfilled or sewered without having first been rendered nonhazardous. Unless these circumstances change, this country will be cleaning up contaminated landfills and water supplies in perpetuity.

My message is that toxic industrial wastes, in particular metal finishing wastes, can and must be made non-toxic and non-hazardous before being disposed of in a landfill or discharged into a municipal sewer system. Best available pretreatment technology should be employed to render such wastes nonhazardous. Rigorous enforcement is needed to assure compliance with these requirements. Finally, controls on the disposition of sewage sludge will reinforce the basic pretreatment program.

PRETREATMENT IS THE KEY TO A TOXICS CONTROL STRATEGY

Pretreatment, as now required by the Clean Water Act, is a primary means to attain the national policy that "the discharge of toxic pollutants in toxic amounts be prohibited." Pretreatment is also essential in order for the objectives and requirements of other environmental laws to be achieved (e.g., the Resource Conservation and Recovery Act (RCRA), the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), and the Ocean Dumping Act).

Envirite has a hands-on perspective of EPA's pretreatment program and a vital stake in its success. For the past eight

years, we have treated metal finishing wastes to make them non-hazardous in accordance with RCRA's delisting provisions. We fully comply with promulgated and proposed effluent guidelines, new source performance standards, and pretreatment standards under the Clean Water Act.

Let me illustrate the importance of pretreatment standards and how pretreatment is an essential part of other environmental programs by discussing the metal finishing industry. Aside from treatable acids and alkalies, metal finishing dischargers into publicly owned treatment works (POTWs) generate 61,000 metric tons of toxic metal wastes annually. These toxic pollutants are primarily chromium, lead, cadmium, nickel, copper, and zinc compounds. These toxic metals need to be converted into insoluble form to avoid future risk to the environment, and therefore have properly been listed by EPA as hazardous wastes.

The metal finishing industry is currently allowed two disposal methods involving no pretreatment. Their toxic wastes can be dewatered and the resultant hazardous waste placed into a land disposal facility regulated under RCRA. Alternatively, these toxic wastes can be discharged into a POTW, where the metals are passed through, untreated, into the sludge. The contaminated sludges are ultimately land disposed, usually by landfilling or land spreading (40%), are applied on the land for agricultural use (20%), are incinerated (25%), or dumped into the ocean (15%). None of these methods eliminates the danger of metal pollutants. Since these toxic metals are very soluble, they readily leach into the environment when land disposed or bioaccumulate when dumped into the ocean. Incineration cannot thermally destroy toxic metals. An effective pretreatment program is the <u>only</u> way to prevent toxic metals from polluting the environment.

RCRA does not now prevent toxic pollutants, particularly metal finishing wastes, from being released into the environment. RCRA excludes from the definition of solid waste any "solid or

dissolved material in domestic sewage." EPA has interpreted this provision and RCRA legislative history to defer to the Clean Water Act as justification to exempt from RCRA hazardous waste regulations any industrial discharge into a POTW. But EPA presumed that the pretreatment program will "insure that users of sewer and treatment systems do not dump wastes into the system that will present environmental problems." 45 Fed. Reg. 3309 (May 19, 1982). However, the failure of EPA to promulgate categorical pretreatment standards has allowed approximately 5 million metric tons of toxic wastes (according to OTA) to be discharged into POTWs, without any pretreatment. These wastes are passed through the POTW into the receiving waters or merely shifted from the generator to the sewage sludge.

A second RCRA deficiency could also be cured by pretreatment. EPA now allows metal finishing and other hazardous wastes to be land disposed without any pretreatment to render them less toxic, mobile, persistent, or bioaccumulative. EPA relies on land disposal facility design and management standards to contain the wastes, but has acknowledged that its standards may not, in many cases, be sufficient to prevent or adequately reduce the potential human health and environmental impacts posed by the land disposal of hazardous wastes. Surface and groundwaters are particularly vulnerable to improper land disposal.

The RCRA land disposal standards are particularly deficient for containing toxic metal finishing wastes. Envirite has therefore petitioned EPA to require, pursuant to RCRA, owners and operators of facilities that dispose of, treat, or store certain metal finishing wastes in a landfill or surface impoundment to pretreat such wastes to produce a stablized, non-hazardous waste and a clean wastewater effluent. Envirite, in other words, is seeking the same pretreatment under RCRA as that required by the Clean Water Act metal finishing pretreatment standard.

Pretreatment is, in addition, the key to the Ocean Dumping program. Fifteen percent of all sewage sludge is dumped in the

ocean. Because most of the sludge comes from larger, urban industrial areas, the potential adverse environmental impacts from toxic pollutants are more significant than even the 15 percent figure suggests. Heavy metals and other toxics that are allowed to be dumped into a POTW, without pretreatment and without complying with RCRA, then are dumped into the ocean as part of the sludge. Ocean dumping is controversial in large part because there is no pretreatment program to remove the heavy metals and other toxics. The presence of metals also prevents incineration of the sewage sludge. Remove the toxics and you remove many of the objections to disposal of the sludge.

Envirite believes that the most effective and efficient toxic metal control strategy is the metal finishing pretreatment standard. Under the metal finishing pretreatment standard, cyanide compounds are destroyed, and hexavalent chromium is reduced to much less toxic and soluble trivalent chromium. An alkaline precipitation process removes the metals from the wastewater, with the resultant sludge virtually impervious to leaching. The sludge resulting from Envirite's treatment process has been delisted as a hazardous waste under RCRA.

Pretreatment will prevent toxics from entering the environment, will close a major RCRA loophole, and facilitate sewage sludge disposal. Envirite therefore views with concern any proposal to alter or weaken the pretreatment program.

THE PRETREATMENT PROGRAM SHOULD NOT BE WEAKENED

The present requirement for pretreatment is only now beginning to be implemented. We think it should be given a chance to work, without significant and disruptive changes at this time. Our concern is heightened when revisions to the pretreatment program are considered with other possible changes to the water quality and water use programs. Envirite

respectfully urges Congress and EPA to take no action that will weaken or delay the pretreatment program and frustrate the goal of eliminating toxic pollutant discharges.

Envirite is concerned that Congress may delay implementation of the pretreatment program. There is no justification for further postponement. As Envirite demonstrates, the metal finishing pretreatment standard is achievable now. The U.S. Court of Appeals for the 3rd Circuit recently upheld the standards and deadline for compliance for the categorical pretreatment standards for the Electroplating Point Source Category. The Court also upheld EPA's economic analysis that concluded that the cost of compliance is not significant.

Note also that without a pretreatment program, neither the individual discharger nor the POTW is now paying the true cost of treatment because the sludge is not now subject to more stringent RCRA standards. Delay in achieving pretreatment will not just adversely affect the Clean Water Act, but as we have pointed out, will seriously undermine the complementary RCRA and ocean dumping programs.

Envirite is concerned that increased local control over the pretreatment system may undermine the program unless certain safeguards are assured. A uniform, national pretreatment system provides technology-based, objective standards for measuring performance.

We cannot develop an infinitely adjustable and "fair" system, where each POTW and indirect discharger is subject only to the exact controls needed, nothing more and nothing less. It is beyond our capabilities, and I am concerned whether it begs the question of "how clean is clean". We are not urging treatment for treatment's sake. We are urging the use of best available treatment, applied uniformly, because we don't know enough to take the chance and require less. We must insure that

the present generation does not bequeath to the next generation the same inheritance we received from the previous generation.

Industrial dischargers and the treatment industry know what is required and can plan accordingly. State and local authorities are authorized to impose more stringent controls where necessary to achieve water quality standards, but should not be allowed to set a standard below the minimum national pretreatment requirement. Every source in the same category should be required to meet the same minimum standard wherever it is located, so that all can compete relatively equally on environmental costs. Resource demands on the POTW, moreover, are limited to monitoring and enforcement actions.

Replacement of uniform, technology-based categorical pretreatment standards with an alternative scheme by which each POTW could establish numerical limits on the amount and concentration of toxic pollutants will, we fear, result in more total toxic pollutants being discharged into the environment. It will increase the uncertainty faced by industrial dischargers and by the treatment industry at a time when Congress should be encouraging treatment rather than land or ocean disposal of toxic pollutants. The pretreatment program must also be considered along with recent EPA proposals that would modify water quality standards regulation, proposals that we fear will undermine a program that has worked. Downgraded water quality standards and designated uses, combined with changes to the pretreatment standard, are a possible outcome of any changes to the Clean Water Act or EPA policy.

Furthermore, at a time when federal financial assistance to state and local pollution control authorities is decreasing, we also question whether POTWs will have the resources and expertise to undertake a program potentially far more complicated and resource intensive than the present one. Proponents may intend the local alternative option to be strictly interpreted and be

limited only to a few well-qualified systems, but experience clearly requires caution in granting EPA such discretion.

The present exemption from secondary treatment under section 301(h) for ocean outfalls allows the direct discharge of industrial wastes that haven't met any RCRA control standards because of the domestic sewage exemption, and that haven't been pretreated because a categorical pretreatment standard is not in place. This provides industrial dischargers with a free, government-granted license to pollute! Envirite urges that the ocean discharge waiver be conditioned on all dischargers into the POTW complying with applicable categorical pretreatment standards, as well as requiring actual enforcement of the standards by the POTW. If there is no pretreatment standard, we don't believe that an ocean discharge waiver should be granted.

As stated earlier, Envirite does not see any need to change the present pretreatment system. We urge that Congress direct EPA to continue the promulgation of final pretreatment rules and their implementation as expeditiously as possible.

PRETREATMENT STANDARDS MUST BE ENFORCED

Envirite's decision not to build a new hazardous waste treatment facility at this time in Eastern Massachusetts is tangible evidence of the consequence of the RCRA domestic sewage loophole, of the loss of momentum caused by the perceived opportunity of getting relief from Congress (and the uncertainties of trying to comply with a moving legislative target), and the lack of resources for enforcement. Envirite cannot compete with a free license to pollute. I have several specific recommendations to improve the compliance with the pretreatment program.

First, we recommend a traditional carrot and stick approach. A portion of any additional funds authorized for construction

grants under H.R. 3282 or the Committee's final bill and for State pollution control assistance under Section 106 should be reserved as incentive grants for POTWs (and States) to enforce general and categorical pretreatment standards.

POTWs are also required to report annually on implementation of their pretreatment program. POTWs should be required to certify annually that a substantial portion of indirect dischargers are in compliance with all applicable pretreatment requirements, and that reasonable further progress is being made to bring non-complying sources into compliance. If the POTW cannot make such a certification, or the State or EPA determines that a significant number of sources are not in compliance, then funds should be withheld until compliance is achieved.

Second, no Sec. 301(h) ocean disposal waiver from secondary treatment should be granted unless all indirect dischargers are in compliance with all applicable pretreatment requirements; we support, therefore, Section 5(b) of H.R. 3282.

Third, anyone who knowingly or negligently introduces into a POTW or sewer system a pollutant or hazardous substance which causes or can reasonably be anticipated to cause personal injury or property or environmental damage should be subject to criminal penalties.

Fourth, anyone who discharges a hazardous waste into a public sewer system should also be subject to RCRA notification and enforcement provisions.

SLUDGE MANAGEMENT MUST REINFORCE THE PRETREATMENT PROGRAM

The proper management of sewage sludge is frustrated by inadequate pretreatment. The Clean Water Act should regulate sewage sludge as well as liquid effluent. Sludge use should be enhanced, not just "not be impaired" during the life of an NPDES permit.

EPA should identify and regulate toxic pollutants which may be present in sewage sludge that may adversely effect human health of the environment. Sludge quality standards are as necessary as water quality standards. Priority candidates should be hazardous wastes and constituents that are restricted from land disposal under H.R. 2867, the "Hazardous Waste Control and Enforcement Act of 1983." It makes little sense to take one waste stream and subject it to stringent management controls if it is to be land disposed directly, but then leave it virtually unregulated if discharged into a sewer system. The Resource Conservation and Recovery Act, as amended by H.R. 2867, is now beginning to be effective to prevent future Superfund dumpsites. Extreme care must be taken that today's unintended weaknesses in the Clean Water Act do not become tomorrow's loopholes for those wishing to escape from RCRA. Toxic pollutants must be treated and destroyed whereever feasible, not shifted from the air to the ground to the rivers to the oceans, depending on enforcement priorities and the legislative reauthorization cycle. The Clean Water Act must protect the total environment.

CONCLUSION

Effective implementation of the pretreatment program under the Clean Water Act is critical to the attainment of the national goal of eliminating toxic pollution of the environment. Envirite believes that the best strategy is to prevent toxics from entering into the environment, rather than rely on inadequate hazardous waste containment requirements or the assimilative capacity of the ocean, or on case-by-case numerical limits that may be impractical to implement and not be sufficiently protective of human health or the environment. Prevention by pretreatment is technologically achievable and cost effective,

20-955 O—84——104

particularly compared to the costs of future hazardous waste site clean-ups, contaminated drinking water and irreversible ocean pollution.

Any change in the requirements of the pretreatment program will be disruptive. The consequences of disruption will have significance beyond the Clean Water Act. Envirite respectfully urges the Committee and Congress to proceed with great caution before making any changes to the pretreatment program that will delay implementation, cause increased uncertainty in the treatment industry, and allow toxic pollutants to continue to be released into the environment that would otherwise be controlled by the existing pretreatment program.

news BRIEFS

Envirite Withdraws Notice-of-Intent to Establish Waste Treatment Facility in Massachusetts

September 15, 1983 - Envirite Corporation (formerly Liqwacon Corporation) today withdrew its notice-of-intent to build a new hazardous waste treatment facility in Eastern Massachusetts. Explaining its recent decision, the waste treatment firm cited uncertainties regarding the development of an effective program to limit the discharge of industrial hazardous wastes into the sewer system serving the greater Boston area.

Envirite, a Pennsylvania-based firm that specializes in converting hazardous metal-finishing wastes into nonhazardous materials, was awarded "feasible and deserving" status in 1981 by the Massachusetts Hazardous Waste Facility Site Safety Council. Since then, the company has been engaged in site identification, market research, and monitoring of state and local efforts to develop effective sewer pretreatment programs.

In a letter today to Dr. Norton H. Nickerson, the Council's Chairman, Envirite President Geoffrey Stengel, Jr., thanked the Council and the Department of Environmental Management for their support and assistance. Stengel also applauded the efforts being made by the Department of Environmental Quality Engineering and the Metropolitan District Commission to strengthen restrictions against discharges to the sewer of untreated hazardous wastes, but indicated that substantial further improvement would be necessary before it would be economical for private enterprise to offer waste treatment services in the eastern portion of the state. "Any privately-owned waste treatment facility would find it difficult to compete with a publicly-owned outlet for untreated wastes," Stengel said in the letter.

According to Stengel: "Much public attention has been focused this year on the need to clean up hazardous waste sites created in the past, but relatively little attention has been paid to the fact that existing laws and regulations continue to permit as much as 80 percent of all hazardous wastes to be landfilled or discharged to sewers without having first been rendered non-hazardous. Unless these circumstances change," said Stengel, "this country will be cleaning up contaminated landfills and water supplies in perpetuity."

Stengel concluded his letter to Dr. Nickerson with an expression of interest in being able to reconsider Envirite's decision in the future: "As a leader in the promotion of advanced technology industries," wrote Stengel, "Massachusetts is a logical home for state-of-the-art waste treatment facilities that can serve the special needs of its increasingly technology-based economy. By rendering wastes nonhazardous, a firm such as Envirite would offer industry in the Commonwealth an environmentally sound alternative to discharging or landfilling contaminated, potentially dangerous materials. As a consequence," concluded Stengel, "it is our hope that there will be another opportunity to consider Massachusetts in the future."

Rendering Wastes Nonhazardous Is Envirite's Niche In The Waste Management Industry

By Margaret M. Nemec

As we turned off a bustling intersection in York, PA and headed toward a modern industrial parkway in a rural setting, we were treated to a typical Pennsylvania springtime view. Colorful blooming trees and farmhouses dotted the verdant, rolling landscape.

An incongruous setting for a waste treatment facility? Perhaps, but as we neared our destination – Envirite Corporation – it was hard to discern the facility from the many modern and meticulously-landscaped manufacturing sites tucked away in the nation's endless industrial parkways.

But then again, Envirite Corp. (formerly Liqwacon Corp.) is not your typical waste treatment facility. One very big difference: waste treatment takes place inside each of the four facilities – under roof.

Background

Envirite Corp., a subsidiary of Yarway Corporation, is headquartered in Blue Bell, PA and operates four treatment facilities: Thomaston, CT; Harvey, IL; Canton, OH; and York, PA. In operation since 1975, the four facilities are located near major industrial sectors to minimize transportation time and costs for the company and customers alike.

Hazardous Materials & Waste Management Magazine visited the York facility for a first-hand look at its unique waste treatment operations and to discuss Envirite's niche in the waste management industry.

Envirite Corp. specializes in the treatment of acid and alkaline inorganic finishing wastes. The wastes include: acids, alkalies, acids and alkalies with heavy metals, metal hydroxide sludges, dilute organics (biotreatable) with

heavy metals, chromic acids, oxidizing agents, reducing agents, cleaning agents, and inorganic rinse waters.

Typical customers served in the metal-finishing industry include: "high technology" electronic firms, steel manufacturers, and electroplating firms.

Each Envirite facility is fully permitted under EPA and the appropriate state as a treatment, storage, and disposal (TSD) facility.

Our hosts for the tour were Fred Holloway, Jr., manager of market development, and John Horstmann, Jr., sales manager at the York facility. Before the tour began, both Holloway and Horstmann were eager to describe how the Envirite waste treatment process benefits generators. "A major benefit," Holloway said, "is delisting." He explained that in late 1981, Envirite treatment residues which met specific EPA criteria were "delisted" – excluded from EPA's roster of hazardous waste. This "delisting," which is offered at all four facilities, cuts short RCRA's cradle-to-grave responsibility and removes the worries generators might have about future, long-term liabilities associated with waste disposal.

"Once a generator's waste is transformed into nonhazardous materials by the Envirite process, the generator has no further hazardous waste liability under RCRA," Horstmann added. As for the "end" waste products, Holloway said: "Sludges are rendered nonhazardous and placed in a nonhazardous landfill. The second end product, the liquid effluent, meets pretreatment standards and is discharged directly into the sewer." The company continuously monitors the sewer discharge to assure compliance with local publicly owned treatment works (POTW) effluent standards.

"How does a generator know for sure that his or her wastes have been rendered nonhazardous?" we asked. "Once our laboratory tests establish that a generator's waste material has been rendered nonhazardous, we provide the generator with a signed certificate stating that the generator's waste is nonhazardous and that the company has no further hazardous waste liability for this material under RCRA," Holloway replied.

Nerve Center

HMWM's tour began in the laboratory – the facility's "nerve center" – where analysis, monitoring, and testing procedures are performed. Before entering the lab, we were treated to a dose of Envirite's safety consciousness and given the appropriate protective equipment for the tour.

The modern and spacious lab houses the latest in instrumentation, including: double-beam atomic absorption spectrophotometers with accessory graphite furnace and electrodeless discharge for analysis ranging from parts per million down to parts per billion. Also in the lab are visible range spectrophotometers, inorganic and organic carbon analyzers, biotreatability testing systems, specific ion meter, oxygen meter, microscopy facilities, distillation equipment, and apparatus required for EPA testing procedures.

On hand the day of the tour was Judith Sayko, manager, laboratory and processing, who told *HMWM* that the lab can test for 30 different metals which might be found in customers' waste. Sayko pointed out the major laboratory equipment used: atomic absorption spectrophotometer, used to verify heavy metal concentration at all phases of the operation, and the total organics carbon analyzer (TOC) which indicates the presence of organics in the waste material.

John Horstmann, Jr., sales manager, told us how the company matches its capabilities with generators' needs. The first step is the sales call where a technical service representative thoroughly reviews the generator's needs. A sample of the generator's waste is then taken for lab analysis. The results of the analysis, together with quotations for waste treatment and transportation costs, are then conveyed to the generator. If all systems are go, Envirite schedules a waste pickup, using its transportation fleet comprised of 5,000-gallon vacuum tank trucks.

Holloway pointed out that another major benefit to customers is the fact that the company focuses on service. Waste pickups are carefully scheduled to meet customers' needs.

Horstmann told us that the drivers get thorough training on all OSHA, EPA, and DOT regulations and safety procedures affecting their jobs. All company personnel are trained in job safety and health procedures affecting their jobs and in the use and care of personal protective clothing and equipment. First aid kits, emergency eyewash stations, self-contained breathing apparatus, air masks, and other equipment are strategically situated throughout the plant.

"How do you ensure that incoming waste matches the original waste sample/analysis?" we asked.

Our hosts told us that additional samples are taken to verify that each truckload conforms to the initial waste sample and, unloading begins **only** after this verification is made.

Envirite was humming with activity the day we arrived. From inside the lab we observed the tankers pulling up and departing. We also saw chemical operators take samples of in-coming waste for analysis and verification and then receive the go-ahead to unload. Curvin Snyder, III, manager of the York operations, joined us for our tour at this point and said that chemical operators cannot unload waste until they receive both written and oral instructions. This apparent duplication is intentional, he said, as it is another of the company's safeguards.

Plant Organization

In addition to the lab, there are three other major activity centers: waste receiving, waste processing, and waste dispatching for the two end products – effluents and solids.

The waste receiving area is divided into three sections: acids, neutral materials and alkaline process chemicals. Special drain and collection systems in these areas, as well as in the processing and dispatching areas, are another example of the company's attention to safety and the environment. In the event of a leak or spill, wastes are collected in a sump system which prevents commingling and potential formation of noxious gases. Any wastes from spills and leaks would be collected and analyzed, and then put through the complete Envirite process.

Following waste analysis and verification, incoming aqueous waste is pumped directly from one of the company's 5,000-gallon tank

trucks in the outside waste receiving bay to one of the many 10,000-gallon holding tanks inside.

The processing area is comprised of reactor systems, vacuum filtration equipment for liquid-solid separation, fume scrubbers, and process pH monitoring. Neutralization, precipitation, chemical fixation and other waste treatment take place in many 10,000-gallon reactor vessels.

The gigantic storage and treatment tanks are constructed of fiberglass or polyethylene. As we made our way through the processing areas, these bright copper-colored tanks towered above us. Holloway pointed out that each facility is designed to treat 50,000 to 75,000 gallons of waste per day.

Treated wastes next go through a vacuum filter for separation of the nonhazardous solid residue, which is fed by a conveyor system to 20 cubic yard containers. The solid residues are tested to ensure that they meet the delisting criteria established by EPA before they are placed in a landfill. The liquid effluent, as mentioned earlier, is discharged into the sewer if it meets pretreatment standards. Holloway emphasized that Envirite continuously monitors the effluent to ensure that it meets pretreatment standards.

Safety Measures

Envirite's attention to safety is evidenced throughout the plant. In addition to the numerous safety measures and worker training cited earlier in this article, safety is a common thread woven into plant design and layout as well, including these features:

- A collection system in the acid storage area has its own sump to catch spills or leaks and to prevent contact with incompatible alkaline or cyanide products.
- Storage and treatment tanks are positioned above ground for easy exterior inspection for leaks.
- Acid and alkaline floor sides of the plant slope away from each other.
- Clean water lines are used to rinse pump lines after pumping.
- An elaborate piping system reduces the potential for spills during waste transfer operations.
- A wall control board situated in the laboratory tracks solution flow.

Hazardous Waste In; Non-Hazardous Waste Out

We asked Holloway and Horstmann for some hazardous waste examples and the steps taken in the Envirite process to render these wastes nonhazardous. They gave these specific examples:

- Pickling acids (sulfuric, hydrochloric, and nitric) from primary metal manufacturing operations – concentrated acids and the metals that are already dissolved in solution are neutralized. Metals are precipitated. The solids are stabilized, rendered nonhazardous, and then tested against all delisting criteria.
- Chromic acids and other plating baths from decorative finishing operations – hexavalent chrome is reduced to a less toxic trivalent state prior to neutralization, precipitation, stabilization, and nonhazardous testing.
- Cyanides from plating, cleaning, and stripping operations are oxidized prior to being run through neutralization, precipitation, and stabilization processes, and testing, as described above.
- Hydroxides from in-house pretreatment systems receive final treatment or polishing to remove the residual metals. Envirite stabilizes that material and renders it nonhazardous so that it meets delisting criteria.
- Ferric chloride from printed circuit board etching (a particularly difficult waste to treat) is run through neutralization, precipitation, and stabilization processes, and is then tested against all delisting criteria
- Hydrofluoric acids from the glass industry (etching and frosting operations) are run through neutralization, precipitation, and stabilization processes and then tested against all delisting criteria.

Next Stop Blue Bell

We left our tour hosts and headed east to Blue Bell, PA, the location of Envirite's corporate offices, to talk with Geoffrey (Sandy) Stengel, Jr., newly-appointed president of the company. Our questions for Stengel focused on Envirite's niche in the waste management industry, plans for future growth, as well as his assessment of the current regulatory mood in Washington with respect to hazardous waste legislation.

Stengel joined the company in January, bringing with him financial and business experience culled from 13 years with Philadelphia

National Bank and a three-year stint as Secretary of Commerce under Gov. Dick Thornburgh (PA).

When asked about Envirite's position in the waste management marketplace, Stengel agreed that Envirite may be small in comparison to some of the "giants" in the industry, but this "smallness affords Envirite's customers specialized service on a day-to-day basis.

Stengel takes pride in Envirite's "high reputation for careful processing and integrity," adding that "Our track record for compliance with governmental regulations is spotless. Our reputation is another assurance to generators that their waste is properly processed, thereby avoiding problems that could result in unfavorable publicity or in additional costs for further treatment."

As for the future, Stengel maintains that it "is a promising one for Envirite because we are bringing state-of-the-art technology to address a major environmental need.

"As the comparative economics become better understood, Envirite expects to grow – both geographically and functionally – but the company will expand only on a step-by-step basis taking care to preserve its own ability to properly neutralize and/or destroy any hazardous waste that it processes. Our position in the marketplace is based on this ability as well as the care we take to ensure that all wastes are rendered nonhazardous, thereby relieving generators of worries about future risk under RCRA" Stengel added.

Eyes On Washington

Envirite keeps close tabs on developments in Washington affecting the waste management industry. In fact, shortly after he joined Envirite, Stengel testified during hearings on amendments to RCRA by the House Energy and Commerce Subcommittee on Commerce, Transportation, and Tourism. He also submitted written testimony to the Senate Environment and Public Works Subcommittee on Environmental Pollution for hearings on amendments to the Solid Waste Disposal Act and on the reauthorization of the Clean Water Act.

Stengel's testimony emphasized the role pretreatment plays in protecting the environment as well as Envirite's three-part formula for solving today's waste management problems. Stengel summed up this formula for us:

"First, encourage industry to find ways to generate less waste. Second, encourage industry to recover and/or recycle as much waste as possible. And, third, for wastes that must go into the environment, find ways to encourage the destruction, neutralization or stabilization, or other methods to render those wastes nonhazardous before they are released into the environment."

Commenting on this formula, Stengel added that, "it is not only the safest approach environmentally, but it is also the most cost-effective approach from industry's standpoint. Granted, proper treatment and destruction of waste at the point of generation can be more expensive in the short term than traditional waste management methods, but these costs are a minute fraction of the long-term costs associated with a Superfund site cleanup."

In assessing the regulatory climate in Washington relative to hazardous waste, Stengel foresees more stringent hazardous waste regulations, citing these factors:

1. Rising public concern about hazardous waste.

2. Increased interest by generators in eliminating the specter of long-term liability associated with wastes.

3. Hazardous wastes have become an important political issue with respect to the environment and will therefore require close attention by all candidates for public office. Recent public opinion polls show that an overwhelming majority of the public want strict hazardous waste regulations.

About The Author

Margaret M. Nemec is editor of *Hazardous Materials & Waste Management* Magazine.

Reprinted from the July/August 1983 issue of
HAZARDOUS MATERIALS & WASTE MANAGEMENT.

Mr. ROE. Please proceed.

TESTIMONY OF GEOFFREY STENGEL, JR., PRESIDENT, ENVIRITE CORP., ACCOMPANIED BY LARRY S. SNOWHITE, ESQ., MINTZ, LEVIN, COHN, FERRIS, GLOVSKY & POPEO, P.C., WASHINGTON, D.C.

Mr. STENGEL. Thank you, Mr. Chairman. Everyone has indicated they intended to be brief. Since I am the only thing standing between you and lunch, I will make a special effort——

Mr. ROE. Or perhaps dinner. If you would summarize, we would appreciate it.

Mr. STENGEL. You have my statement. I will try to summarize.

Mr. Chairman, I am president of Envirite Corp., a Pennsylvania-based firm that specializes in converting hazardous metal finishing wastes into nonhazardous materials. I am pleased to testify on the reauthorization of the Clean Water Act, and in support of H.R. 3282. I am confident that a strong bill will emerge from this subcommittee under your leadership, Mr. Chairman.

On September 15, 1983, Envirite withdrew its notice-of-intent to build a new hazardous waste treatment facility in eastern Massachusetts. The reason we withdrew at this time is that there does not appear to be a clear prospect of sufficient business developing in Massachusetts to justify a new plant, although there certainly are prospects. The major issue is uncertainty on our part as to the success of State and local efforts to establish and enforce treatment standards, limiting the discharge of industrial pollutants into the sewer system serving the greater Boston area. Any privately owned waste treatment facility would find it difficult to compete with a publicly owned outlet for untreated wastes.

Much national public attention has been focused this year on the need to clean up hazardous waste sites created in the past. Relatively little attention has been paid to the fact that existing laws and regulations continue to allow as much as 80 percent of all hazardous wastes to be landfilled or sewered without having first been rendered nonhazardous. Unless these circumstances change, this country will be cleaning up contaminated landfills and water supplies in perpetuity.

My message is that toxic industrial wastes can and must be made nontoxic and nonhazardous before being disposed of in a landfill or discharged into a municipal sewer system. Best available pretreatment technology should be employed to render such wastes nonhazardous. Rigorous enforcement is needed to assure compliance with these requirements. And, finally, controls on the disposition of sewage sludge should be established to reinforce the basic pretreatment program.

Pretreatment is a primary means to attain the national policy that the discharge of toxic pollutants in toxic amounts be prohibited. Pretreatment is also essential in order for the objectives and requirements of other environmental laws to be achieved.

Pretreatment will prevent toxic pollutants from entering the environment, will close a major RCRA loophole, and facilitate sewage sludge disposal.

Envirite, therefore, views with concern any proposal to alter or weaken the pretreatment program.

The present requirement for pretreatment is only now beginning to be implemented. We think it should be given a chance to work without significant and disruptive changes at this time. Our concern is heightened when revisions to the pretreatment program are considered with other possible changes to the water quality and water use programs.

Envirite respectfully urges Congress and EPA to take no action that will weaken or delay the pretreatment program and frustrate the goal of eliminating toxic pollutant discharges. Envirite is concerned that Congress may delay implementation of the pretreatment program. There is no justification, in our opinion, for further postponement.

As Envirite demonstrates, the metal finishing pretreatment standard is achievable now. The U.S. Court of Appeals for the Third Circuit recently upheld the standards and deadline for compliance for the categorical pretreatment standards for the electroplating point source category.

Envirite is concerned that increased local control over the pretreatment system may undermine the program unless certain safeguards are assured. A uniform, national pretreatment system provides technology-based, objective standards for measuring performance.

In addition, the present exemption from secondary treatment under section 301(h) for ocean outfalls allows the direct discharge of industrial wastes that have not met any RCRA control standards because of the domestic sewage exemption, and that have not been pretreated because a categorical pretreatment standard is not in place. This provides industrial dischargers with a free, Government-granted license to pollute. Envirite urges that the ocean discharge waiver be conditioned on all dischargers into the POTW complying with applicable categorical pretreatment standards as well as requiring actual enforcement of the standards by the POTW.

If there is no pretreatment standard, we do not believe that an ocean discharge waiver should be granted. As stated earlier, Envirite does not see any need to change the present pretreatment system. We urge that Congress direct EPA to continue the promulgation of final pretreatment rules and their implementation as expeditiously as possible.

Enforcement is just as important. I have several specific recommendations to improve the compliance with the pretreatment program.

First, we recommend consideration be given to a traditional carrot and stick approach. A portion of any additional funds authorized for construction grants under H.R. 3282 or the committee's final bill and for State pollution control assistance under section 106 should be reserved as incentive grants for POTW's, and States, to enforce general and categorical pretreatment standards.

POTW's are also required to report annually on implementation of their pretreatment program. POTW's should be required to certify annually that a substantial portion of indirect dischargers are in compliance with all applicable pretreatment requirements, and

that reasonable further progress is being made to bring noncomplying sources into compliance.

If the POTW cannot make such a certification, or the State or EPA determines that a significant number of sources are not in compliance, then funds should be withheld until compliance is achieved.

Second, no section 301(h)——

Mr. ROE. If the gentleman would yield, your testimony, and I know you have labored hard and your testimony is very important to this committee, we have a double suspension vote. We want to hear your testimony, so I think that we are rushing now and that is unfair to you and, more important, unfair to us. So what we will do is recess, and I am sorry to keep you waiting, but we cannot do it any faster, we will recess and go and vote. It is a 15-minute vote, but it is already halfway through, and we have a 5-minute vote on two suspensions. We will do that and we will come right back. It will take us about 15 minutes.

[A short recess was taken.]

Mr. ROE. The subcommittee will reconvene.

Mr. Stengel, we were not quite to your conclusion.

Mr. STENGEL. We were very close, Mr. Chairman. I was on the third and final major point that this statement makes. The first was that there ought to be a national pretreatment program. The second was that there also had to be strong enforcement of that program, and the third point, which I am about to get to, is the need for people to pay attention to what happens to sewage sludge.

In terms of enforcement, the second point we do have a number of recommendations and I just finished talking about providing some incentives that would encourage POTW's to have proper pretreatment programs.

A second suggestion would be no section 301(h) ocean disposal waiver from secondary treatment should be granted unless all indirect dischargers are in compliance with all applicable pretreatment requirements. Therefore, we support section 5(b) of H.R. 3282.

Third, anyone who knowingly or negligently introduces into a POTW or sewer system a pollutant or hazardous substance which causes, or which can reasonably be anticipated to cause personal injury or property or environmental damage, should be subject to criminal penalties.

Fourth, anyone who discharges a hazardous waste into a public sewer system should be subject to RCRA notification and enforcement provisions.

Finally, the problems of sewage sludge also should not be neglected. The proper management of sludge is frustrated by inadequate pretreatment.

The Clean Water Act should regulate sewage sludge as well as liquid effluent. Sludge use should be enhanced, not just "not be impaired" during the life of an NPDES permit.

EPA should identify and regulate toxic pollutants which may be present in sewage sludge that may adversely effect human health or the environment. Sludge quality standards are as necessary as water quality standards. Priority candidates should be hazardous wastes and constituents that are restricted from land disposal under H.R. 2867. Restrictions on land disposal of hazardous waste

should extend to land disposal of sewage sludge, where such restricted wastes have passed through the POTW into the sludge, without pretreatment as may be required by RCRA or the Clean Water Act. It makes little sense, in our opinion, to take one waste stream and subject it to stringent management controls if it is to be land disposed directly, but then leave it virtually unregulated if discharged into a sewer system. The Resource Conservation and Recovery Act [RCRA]—hopefully as amended by H.R. 2867—is now beginning to be effective to prevent future Superfund dumpsites. Extreme care must be taken that today's unintended weaknesses in the Clean Water Act do not become tomorrow's loopholes for those wishing to escape from RCRA. Toxic pollutants must be treated and destroyed wherever feasible, not shifted from the air to the ground to the rivers to the oceans, depending on enforcement priorities and the legislative reauthorization cycle. The Clean Water Act must protect the total environment.

In conclusion, effective implementation of the pretreatment program under the Clean Water Act is critical to the attainment of the national goal of eliminating toxic pollution of the environment. Envirite believes that the best strategy is to prevent toxics from entering into the environment, rather than rely on inadequate hazardous waste containment requirements or the assimilative capacity of the ocean, or on case-by-case numerical limits for dischargers into POTW's that may be impractical to implement and not be sufficiently protective of human health or the environment. Prevention by pretreatment is technologically achievable and cost effective, particularly compared to the costs of future hazardous waste site cleanups, contaminated drinking water, and irreversible ocean pollution.

Any change in the requirements of the pretreatment program will be disruptive. The consequences of disruption will have significance beyond the Clean Water Act. Envirite respectfully urges the committee and Congress to proceed with great caution before making any changes to the pretreatment program that will delay implementation, cause increased uncertainty in the treatment industry, and allow toxic pollutants to continue to be released into the environment that would otherwise be controlled by the existing pretreatment program.

Thank you.

Mr. ROE. I want to thank you for your testimony. I think it is very well put together. So I think it has been a great help to our committee. Of course, the one thing we are wrestling with is to try to figure out some way to get EPA to do the work they should do in a timely fashion. I am sure you are aware of that problem.

Mr. STENGEL. Yes, sir.

Mr. ROE. Do you have any questions?

Mr. STANGELAND. No.

Mr. ROE. I do not have any further questions. I think you summed it up excellently. We do appreciate your testimony, and we will be talking with you further.

Mr. STENGEL. Thank you.

Mr. ROE. Thank you very much for a job well done.

Mr. ROE. The subcommittee will recess until tomorrow morning at 10 o'clock.

[Whereupon, at 2:10 p.m. the committee recessed to reconvene at 10 a.m. the following day.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, NOVEMBER 2, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 10 a.m., in room 2167, Rayburn House Office Building, Hon. James F. McNulty, Jr., (chairman of the subcommittee) presiding.

Mr. MCNULTY. Good morning. The meeting will come to order.

The hearings are continuing on possible amendments to the Clean Water Act. We expect Mr. Roe shortly, and he will take over when he arrives.

Mr. Stangeland.

Mr. STANGELAND. Thank you, Mr. Chairman.

It is a pleasure to be here again for the ninth day of this Congress Clean Water Act hearings. We have received a lot of valuable testimony and insight into the successes and shortcomings of this most important environmental statute. The information is essential for us to receive if we are to perform our legislative responsibilities in the best interest of the Nation.

I am certain this morning's witnesses will help us continue to build a thorough, honest Clean Water Act, Reauthorization Act record that is our goal. I thank all the witnesses this morning for being willing to devote their time and energy and look forward to receiving their thoughts on how we can make an excellent national clean water program even more effective than it is today.

Thank you, Mr. Chairman.

Mr. MCNULTY. Thank you, Mr. Stangeland, the ranking minority member of the subcommittee.

Mr. Smith.

Mr. ROBERT SMITH. Mr. Chairman, I want to welcome the witnesses here today and point out to you, Mr. Chairman, that what we lack in number we exceed in quality, especially in the Chair. I am proud to have you there.

Mr. MCNULTY. That is a compliment beyond due. And the two gentlemen that have spoken have been especially diligent in terms of attendance at these meetings, and the process is the better for it.

We would begin, then, this morning with a presentation from the American Paper Institute, National Forest Products Association. My agenda shows that Rodney Glover, the Manager of the Environmental Technology Regulatory Affairs at Procter & Gamble and

Chairman of the API/NFP, a Clean Water Act group, is to be our first witness.

Are you, Mr. Glover.

Mr. GLOVER. Yes, sir.

Mr. MCNULTY. Good morning, sir, and welcome. We would like to hear from you at this time.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

AMERICAN PAPER INSTITUTE

NATIONAL FOREST PRODUCTS ASSOCIATION

API NFPA Environmental and Health Program
1619 Massachusetts Ave., N.W., Wash., D.C. 20036

SUMMARY OF STATEMENT FOR THE RECORD

Pretreatment

1. Our experience with the pretreatment program to date, convinces us that changes to the program are needed if it is to be implemented effectively (pp. 5-8).

2. In the past, EPA has encouraged POTWs to require pretreatment of compatible pollutants as an alternative to adequate municipal waste treatment. To correct this problem, API/NFPA urge the Subcommittee to adopt a provision similar to Section 7 of S. 431 (pp. 8-11).

3. Because of the current level of POTW dissatisfaction with the removal credits program, and the likelihood that redundant treatment will result from the failure of POTWs to apply removal credits, API/NFPA urge the Subcommittee to revisit the Administration's proposal (or similar alternatives) to simplify the pretreatment program (pp. 11-14).

BAT/BCT Compliance Deadline Extension

1. The current July 1, 1984 deadline dates cannot be met due to EPA delay in promulgating effluent limitations guidelines. API/NFPA support an extension of the BAT/BCT compliance deadlines until three years after promulgation of the pertinent effluent limitations, or three years after July 1, 1983, whichever is later. We would not object to a cut-off date of July 1, 1987 (pp. 14-15).

Extension of the NPDES Permit Term

1. Extending the term of NPDES permits from five to up to ten years would be helpful in order to reduce the permitting work load on both EPA and permittees. API/NFPA support such a change (pp. 15-16).

2. If the permit term is extended to up to ten years, the existing permit reopener provisions in EPA's current regulations should be retained. API/NFPA oppose a mandatory permit reopener, except in the case of toxic pollutants (pp. 16-22).

20-955 O—84——105

EPA Review of State-Issued NPDES Permits

1. API/NFPA believe that EPA review of all state-issued NPDES permits is no longer necessary, uses valuable staff time, and delays issuance of permits as a result of EPA-state disagreements over best engineering judgment permit conditions. We recommend, instead, a periodic EPA audit of the performance of state NPDES programs (pp. 22-24).

2. At a minimum, EPA should be required to implement the Section 402(e) and (f) waivers of permit review for certain categories of discharges (pp. 24-25).

Water Quality Standards

1. We believe that EPA's soon-to-be-published water quality standards regulations will resolve many of the concerns raised by the Agency's October 1982 proposal, while still making needed corrections in the water quality standards program. Congressional action in this area should be deferred pending a careful review of EPA's final regulations (pp. 27-38).

2. Section 6 of S. 431 raises serious concerns because it would: (1) reduce the flexibility necessary to administer the water quality standards program by codifying existing regulations (pp. 38-41); (2) freeze all measured water quality parameters in a stream, irrespective of the practical impact on ambient water quality or the needs of local aquatic communities (pp. 42-43); and (3) specify a strict antidegradation policy (pp. 43-44).

Estuarine Protection

1. API/NFPA do not generally object to Section 9 of H.R. 3282. However, this section should be clarified to: (1) make the creation of estuarine conferences a joint decision by EPA and the states; and (2) define the responsibilities of states that participate in these conferences (pp. 44-45).

Section 404 Dredged or Fill Permit Program

1. The Section 404 program is one area of the Act where a period of administrative stability is needed to achieve effective program implementation. Consequently, API/NFPA urge deferral of Congressional action at the present time (pp. 45-47).

Section 404 Dredged or Fill Permit Program (continued)

2. The specific changes proposed in Section 10 of H.R. 3282 are particularly troublesome in that they usurp legitimate Agency administrative responsibilities. Section 10 would: (1) substantially modify the standards used in the processing of Section 404 permit applications; and (2) freeze into law, complicated administrative procedures for interagency review of Section 404 permits. Both changes represent issues that should be left to regulatory agency discretion (pp. 47-49).

Nonpoint Sources

1. API/NFPA support H.R. 4037 with changes to: (1) clarify the "federal program consistency" provision; and (2) modify the "interstate conference" provision to make conferences consistent with existing programs (pp. 49-71).

Antibacksliding

1. Section 13 of S. 431 contains a far-reaching provision prohibiting renewed NPDES permits from containing any requirements or conditions less stringent than the previous permit. This proposal severely disrupts EPA's current NPDES permitting policy. It would forbid changes in permit requirements even when such modifications are justified by: (1) process or production changes; (2) mistakes in the original permit limitations; (3) changes in the quality of intake waters; or (4) other important variables. We urge the Subcommittee to reject this proposal should it be offered in the House (pp. 72-76).

Federal Common Law, the Resolution of Interstate Disputes, and Preservation of Other Rights

1. Some have proposed an amendment to offset a 1981 Supreme Court decision which held that the Clean Water Act preempts federal common law. We oppose such a provision. The Act already provides opportunity for public participation in permit proceedings, and for EPA consideration of the interests of all affected parties. Companies in compliance with Clean Water Act permits should not be subject to further liability under the uncertain standard of the federal common law of nuisance (pp. 76-79).

Federal Common Law, the Resolution of Interstate Disputes, and Preservation of Other Rights (continued)

2. S. 431 contains amendments to Sections 402, 505, and 511 of the Act designed to achieve ends similar to a "common law" amendment, by modifying the provisions governing: (1) interstate review of permits; and (2) citizen suits. The proposed standard of review in both amendments is unacceptably broad. We urge the Subcommittee to reject both of these amendments should they be offered in the House.

3. The "interstate dispute resolution" amendment would allow a downstream state to require EPA to review another state's permit in any case where there is "demonstrated harm to the interests of the affected state" (pp. 79-82).

4. The "preservation of other rights" amendment appears to create a new federal right of action (with jurisdiction in federal or state courts) for injuries caused by any "act or activity within the field covered by" the Act. Relief would be provided under applicable state statutory or common law in federal court (pp. 82-84).

Statement for the Record

of

Rodney C. Glover
Manager, Environmental Technology & Regulatory Affairs
Procter & Gamble Corporation

On Behalf of the

American Paper Institute

and the

National Forest Products Association

1619 Massachusetts Avenue, N.W., Washington, D.C.

Before the

Subcommittee on Water Resources

Committee on Public Works and Transportation

of the

United States House of Representatives

November 2, 1983

I. INTRODUCTION

Good morning. I would like to thank Chairman Roe and the members of this Subcommittee for allowing me to testify this morning on behalf of the American Paper Institute and the National Forest Products Association (API/NFPA) with respect to Amendments to the Clean Water Act (CWA).

My name is Rod Glover. I am manager of Environmental Technology and Regulatory Affairs for the Procter & Gamble Corporation in Cincinnati, Ohio. I also serve as Chairman of the API/NFPA Clean Water Act Task Group. API/NFPA are national trade associations representing over 2,000 member companies who own and manage forest lands, and manufacture pulp, paper, and solid wood products. API/NFPA members have a direct interest in the effective implementation of the Clean Water Act.

Since 1972, I have been personally involved in the implementation of the Clean Water Act through my employer's support for its objectives. As part of that effort, I have also been an active member of several API/NFPA water committees and task forces.

II. FOREST INDUSTRY SUPPORT FOR THE CLEAN WATER ACT

API/NFPA's concern with the country's water resources predates the 1972 Federal Water Pollution Control Act. API/NFPA support the Act, as modified by the 1977 amendments. The 1977 record demonstrates that we were one of the industry leaders in proposing reasonable and constructive changes to the Act. The implementation of the Act today reflects the mid-course corrections we recommended, and this Subcommittee adopted, in 1977. These corrections did not modify or delay any of the basic objectives of the Act, but made it more effective.

Clearly, the most far-reaching and important 1977 amendments to the Act were those which distinguish between the treatment requirements for toxic and conventional pollutants. In 1977, Congress recognized the need to address the problem of toxic pollutants while, at the same time, selectively reducing excessive regulation of conventional pollutants. Congress determined that the costs of additional treatment should not be excessive in light of the effluent reduction benefits to be achieved. Thus, Congress created the concept of BCT -- best conventional technology.

At the same time, Congress decided to retain technology-based limitations as the basic foundation of the Act. This is a decision that we supported in 1977. I want to make it very clear at the outset of my statement that this is a decision which API/NFPA continue to support today. More importantly, we see

no reason to move away from the technology-based approach of the 1972 Act as Congress commences the current review of the statute.

Over two and one half years ago, API/NFPA began an intensive review of the Clean Water Act in order to determine what changes, if any, are necessary to improve its effectiveness. We looked, in particular, for additional opportunities to apply the guiding 1977 philosophy of "avoiding treatment for treatment's sake."

After concluding our review, we believe that the Act can be more effectively focused in two ways: (1) eliminating costly and unnecessary requirements which do nothing to improve water quality; and (2) concentrating the decision-making process at the most efficient level of government to deal with a particular program -- often the state or local agency.

The amendments recommended by API/NFPA are few in number and modest in their impact. They constitute a further refinement of the Act. In the following statement for the record, we will discuss a number of changes which we advocate. We will also review those provisions of interest to us in (1) H.R. 3282, introduced by Public Works and Transportation Committee Chairman, James Howard; and (2) H.R. 4037, introduced by Congressman James Oberstar. In addition, we will reassess -- as will the Committee, we hope -- some of the amendments included in a package submitted by the Administration for consideration in the second session of the 97th

Congress. Finally, we will discuss a number of issues of concern to us that have been raised during the House and Senate Clean Water Act deliberations, to date.

III. API/NFPA PRIORITY LEGISLATIVE ISSUES

At the conclusion of our own review of the Clean Water Act, we identified four major areas where modest reforms would be helpful: (1) simplification of the pretreatment program; (2) extension of the BAT/BCT compliance deadlines; (3) lengthening the life of NPDES permits from five to up to ten years; and (4) eliminating redundant EPA review of state-issued NPDES permits. The first three of these issues are addressed by either H.R. 3282, S. 431 (reported by the Senate Environment and Public Works Committee on September 21, 1983), and/or the Administration's 1982 proposals. Below, we provide our views on the best way to deal with each area of concern.

A. Pretreatment

We are pleased that both Section 7 of S. 431, and Section 6 of the Administration's 1982 proposal recommend some changes to the pretreatment program. Changes to this program are considered to be among the most essential by the forest industry, as well as by other groups. The present program is clearly in need of redirection -- it has failed to get off the ground.

1. The Pretreatment Program -- Our Experience to Date

The forest industry supports the general concept of pretreatment of certain industrial wastes, as envisioned in Section 307(b) in the 1972 Federal Water Pollution Control Act. We recognize the need for pretreatment of industrial pollutants that: (1) are not susceptible to treatment in publicly-owned treatment works (POTWs); (2) would interfere with the operation of such a municipal system; or (3) would interfere with the intended disposal procedure for the sludge. Consequently, we did not object to EPA's 1973 regulations which implemented, for the first time, the so-called general pretreatment program.

In 1977, Congress amended Section 307(b) to provide POTWs with the opportunity to offer "removal credits" to their industrial clients. These credits would apply to any toxic pollutants which the POTW could effectively treat. Industries gaining removal credits from their POTWs would be able to offset them against their pretreatment requirements for the specified pollutants. EPA was charged with the responsibility of developing regulations to implement the removal credits provision.

The removal credits program, as envisioned by Congress in 1977, was complex but seemed workable. The credits were to serve as an incentive to both industry and the local community to encourage the construction and operation of cost-effective, regional treatment.

API/NFPA supported the removal credits approach in 1977. In our view, this provision was designed to serve as a continuing incentive for local industrial participation in POTW systems. In addition, removal credits were designed to assure that the removal levels which justified the local credits would be maintained by the municipality through the operation of a sound POTW operation and maintenance program, as well as an effective pretreatment program. Thus, the removal credits approach was designed to result in better POTW operation as well.

Unfortunately, after EPA promulgated the general pretreatment regulations in June 1978, it became obvious that the Agency's interpretation of the law was considerably different from ours. EPA failed to consult with the POTWs, or to take into account the basic needs of local agencies in framing these regulations. The regulations EPA proposed for removal credits were so complex and burdensome as to be unworkable.

In addition, EPA has, in some instances, encouraged local POTWs to force long-term industrial customers to install pretreatment for fully compatible pollutants such as Biochemical Oxygen Demand (BOD). This 1978 policy disregarded the stated objective of the act to encourage joint treatment of compatible wastes. This issue represents our industry's single, greatest concern with the program.

Litigation, followed by settlement negotiations, appeared for a time to have solved the worst of these problems. However, EPA failed to effectively implement the negotiated settlement with respect to compatible pollutants in the January 28, 1981 general pretreatment regulations (46 Fed. Reg. 9404). In addition, there is evidence that municipal treatment authorities such as Los Angeles and Chicago have now become convinced by EPA that it will be futile for them to implement the removal credit system.

On September 28, 1982, EPA published a proposal to revise the removal credit portion of the general pretreatment regulations (47 Fed. Reg. 42698). EPA made a considerable number of improvements in the removal credits system. API/NFPA appreciate the Agency's efforts to remedy the problems associated with the program. However, the proposed regulations -- while reducing some of the complexities of the January 28, 1981 regulations -- do not resolve the basic problems associated with the removal credits program.

The September 1982 proposal would allow POTWs to calculate removal of seven toxic, heavy metals plus cyanide on the basis of a "national removal rate." While this "national removal credit" will greatly reduce the demands on a POTW to develop its own credits, the list is extremely limited in size. Moreover, it is further constrained by requiring POTW compliance with secondary treatment in order to use the national credits. EPA estimates that more than 45% of all POTWs will be able to qualify for the national rates. The Association of Metropolitan Sewerage Agencies (AMSA) estimates, however, that the percentages will be far lower.

While simpler than the 1981 removal credits system, EPA's September 1982 proposal is still too complex in the view of AMSA and other interested groups. Without the willingness and ability of major POTWs to apply for (and implement) a removal credit system, the program will simply not work, confounding the Congressional intent to avoid redundant treatment.

In our view, the problems associated with the removal credits program are a reflection of basic statutory flaws in the pretreatment program. We believe that the issues described below can be effectively resolved only through legislative change. Specifically, API/NFPA believe that amendments to the current pretreatment program are needed to resolve two major concerns: (1) we have no assurance that EPA will not force POTWs to require pretreatment of compatible, nontoxic pollutants as an alternative to adequate municipal waste treatment; and (2) the toxics regulatory scheme requires redundant treatment of toxic pollutants, and does not have the support of the local agencies.

2. Redundant Treatment of Compatible Pollutants Must Be Avoided

In general, API/NFPA members that discharge into POTWs do not discharge toxic pollutants. Most of our industry effluents are characterized by the presence of conventional pollutants such as Biochemical Oxygen Demand (BOD) or total suspended solids. These pollutants are similar in many respects to domestic wastes, and are

compatible with POTW treatment capabilities. Thus, EPA policy, which has encouraged or required pretreatment of these conventional wastes, is of critical concern to API/NFPA.

The House/Senate Conference Report accompanying the 1972 Act clearly states that:

> Pretreatment of biological waste that is compatible with the treatment provided by a publicly-owned waste treatment plant into which such waste is introduced may not be necessary....In no event is it intended that pretreatment facilities be required for compatible wastes as a substitute for adequate municipal waste treatment works. (Leg. History; 1972 FWPCA; Vol. 1; page 313)

In our view, Congress was correct in encouraging the joint treatment of similar municipal and industrial wastes wherever possible, as the most cost-effective approach to regional treatment needs. In some cases, there is also a technical benefit to this approach. Many industrial wastes, although highly treatable and biodegradable in biological systems, lack nutrients such as nitrogen and phosphorus compounds. Domestic wastes have an excess of these compounds. It is, therefore, very efficient to treat both categories of wastes by mixing them in a common treatment facility.

However, EPA practice since 1978 has been to encourage cities with inadequate or poorly operated POTWs to require pretreatment of conventional pollutants by their customers, rather than to correct the problems of the POTW. Appendix A of this statement provides a case study outlining this problem.

API/NFPA recognize that, in some instances (for example: large volume, seasonal discharges), it may be less costly to require corrective measures at the industrial facility than to increase the size of a POTW. In addition, large, intermittent discharges of compatible pollutants may be disruptive to some POTWs, and may require some form of flow containment and controlled release. However, these types of determinations are best left to individual communities. They are not a matter that should be prejudiced by an EPA policy.

At the time of the 1979 settlement agreement discussed above, EPA agreed to include the following comment in the revised regulations:

> This provision is not intended to require pretreatment for compatible wastes as a substitute for adequate municipal treatment. When difficulties arrive in meeting NPDES permit conditions, it is the responsibility of the POTW to come into compliance with its permit. The POTW should consider a solution that is cost-effective and equitable and consistent with the goal of joint treatment.

As you may note, this comment is very similar to the language quoted earlier from the 1972 Act's Conference Report. It did not introduce a new or radical concept to the program. However, in the January 28, 1981 revised final regulations, EPA removed, without reasonable explanation, the above comment from the body of the regulations. The Agency simply noted in the preamble that it had been removed. Even though these elements of the

January 28, 1981 regulations were remanded to EPA for revision by the U.S. Court of Appeals for the Third Circuit on September 20, 1983, we have no evidence that the Agency is reconsidering this counterproductive past policy.

Consequently, we are pleased that language has been included in both S. 431 as reported by the Senate Environment and Public Works Committee, and the Administration's 1982 proposal, which makes it clear that Congress does not intend EPA to require pretreatment of compatible pollutants that could reasonably be handled by a well designed or operated POTW. We strongly urge this Subcommittee to adopt a similar measure in order to correct a vexing problem of long standing with EPA's administration of the general pretreatment program.

3. Priority Pollutants -- A More Efficient Approach Is Needed

As previously indicated, priority or toxic pollutants are not a major issue for our industry. However, we do have some potential concerns in this area. Moreover, we believe that EPA cannot implement a workable pretreatment program until there is a more effective, appropriate means of addressing controls for toxic pollutants. The complexity and rigidity of the current pretreatment program will only produce more delays in implementing any program for the pretreatment of toxic pollutants.

Other reviewers of the program have come to similar conclusions. The House Public Works and Transportation Committee's Oversight and Review Subcommittee concluded in December 1980 that:

> The [pretreatment] requirements are unworkable...and certain to lead to costs totally out of proportion to any environmental benefits derived. (House Rept. No. 96-1; page 41)

Further, in testimony before the House Water Resources Subcommittee in July 1982, EPA expressed the concern that the pretreatment program lacks the flexibility to recognize and reward local responsibility and expertise, or to provide incentives for expansion of the state and local role. The EPA Deputy Administrator, in his House testimony on July 27, 1982, further noted that:

> Municipalities and local authorities have come a long way in developing experience and ability to address local pollution control problems. We estimate that 80 percent of the large POTWs and 39 percent of the smaller POTWs have made substantial progress towards instituting adequate local pretreatment programs. Furthermore, our estimates indicate that 65 percent of the heavy metals and 37 percent of the toxic organics from indirect industrial discharges are currently being removed through local pretreatment efforts. (EPA Testimony, page 56)

It is important to note that these are 1982 figures. Additional POTWs have implemented pretreatment programs in the past eighteen months.

20-955 O—84——106

Local POTWs should have the opportunity to demonstrate their ability to control toxic discharges. We supported the Administration's proposed changes to the pretreatment program in 1982. We also supported the concepts embodied in Section 7 of S. 431, as introduced on February 3 of this year. Both provisions recognize that a properly operated POTW, with sufficient safeguards (including adequate monitoring and enforcement), can effectively implement a pretreatment program.

Unfortunately, during Committee deliberations the Senate elected to delete provisions dealing with this problem. Consequently, S. 431 as reported does not address the important problem of redundant treatment of toxic pollutants under the current program.

The lack of Senate Committee action was more the result of the difficulty in agreeing upon a particular approach, rather than a perception that change is not needed. Indeed, the Report accompanying S. 431 recounts the difficulties with the present program and concedes that:

> Even though many Members of the Committee favored some type of modification, none could be agreed upon. An alternative program could not be found that could reasonably be expected to protect against pass through and sludge contamination without being so restrictive that no facility could apply. (Senate Rept. No. 98-233; page 5)

The September 20 Third Circuit decision has exacerbated, rather than resolved, many of the problems associated with EPA's current removal credits policy and combined waste stream formula. API/NFPA urge the Subcommittee to act affirmatively on a program designed to provide additional flexibility to POTW's in implementing pretreatment requirements. We believe that the Administration's 1982 proposal represents a good starting point for the Subcommittee's deliberations.

B. BAT/BCT Industrial Compliance Deadline Extension

The extension of the current July 1, 1984 BAT/BCT compliance deadlines represents an issue where there appears to be a general consensus concerning the need for Congressional action this year. Section 4 of H.R. 3282 amends the current Act to require compliance with BAT/BCT requirements within three years after EPA issues the effluent limitation guidelines pertinent to a particular industry. S. 431, as reported, takes a slightly different approach, requiring compliance with BAT/BCT requirements, "not later than three years after promulgation of the effluent limitations, or three years after July 1, 1983, whichever is later (but in no case later than July 1, 1987)." The Administration's 1982 proposal provided a simple extension of the current deadline until July 1, 1988.

All three of these proposals to extend the compliance deadline dates are realistic responses which take into account the delays experienced by EPA in promulgating BAT/BCT effluent

guidelines. Simply stated, industry will have insufficient time to meet the present compliance deadlines based upon EPA's published time schedule for promulgating the BAT/BCT effluent guidelines.

After reviewing each of the three proposals, API/NFPA support the approach taken in S. 431. In our view, S. 431 provides industry with a date certain and sufficient lead time to achieve compliance with BAT/BCT requirements, while still retaining a statutory compliance deadline to encourage EPA to move promptly toward promulgation of final effluent limitation guidelines for all industrial categories.

C. NPDES Permit Term and Reopener Provisions

The National Pollutant Discharge Elimination System (NPDES) -- perhaps more than any other Clean Water Act program -- has been complicated by numerous, and often conflicting, administrative reforms, rulemaking actions, and judicial decisions. Under current procedures, it may take up to three years to negotiate a five year NPDES permit for an industrial facility.

One change that would substantially reduce the current administrative burden associated with the NPDES program involves extending the term of NPDES permits to up to ten years. This concept is reflected in both the Administration's 1982 proposed amendments, and S. 431 as reported.

For EPA and the state agencies assigned the responsibility of issuing NPDES permits, extending the length of the permit would allow the staggering of permit renewals and, thus, reduce the annual permitting workload. This change would also prevent large permit backlogs from accumulating in the future.

In addition, from industry's perspective, the ten year permit would recognize that pollution control investments are expensive, and that once made, the discharger requires a reasonable certainty that his investment will have a useful life before he is required to make a new one. Moreover, the ten year term is particularly useful in providing an industry a longer time against which to write-off the cost of the pollution control equipment required by the permit.

The question of lengthening the term of the NPDES permit invariably raises the issue of appropriate reopener provisions to ensure necessary environmental protection. Section 10 of the Administration's 1982 proposal retains existing law and Agency procedures in this area, requiring that a permit be reopened when a new health-based toxic pollutant standard is developed under the provisions of Section 307(a) of the Act. API/NFPA support Section 10 of the Administration's 1982 proposal.

Unfortunately, the approach taken in S. 431 is substantially more complicated, and ultimately undesirable. S. 431 would modify Section 402(b)(1)(B) of the Act to extend the life of NDPES permits

from the current five-year term to, "fixed terms not exceeding ten years." The length of permits which involve waivers or other modifications would be left at five years. This change is similar to the Administration's proposal.

Our problems arise with the second portion of the amendment which would create a new Section 402(b)(1)(D) requiring that permits:

> (D) shall be promptly modified when new or revised requirements under Sections 301, 302, 303, 304, 307, 403, or 405 are established which are more stringent than any requirement in the permit or which control pollutants not limited in the permit and such modification implements these new or revised requirements. (Emphasis added.)

This provision creates a mandatory permit reopener any time there is a change in applicable effluent limitations, water quality standards, ocean discharge criteria, or sewage sludge disposal regulations.

Such a requirement would substantially affect EPA's existing permit modification and reopener provisions in the May 19, 1980 Consolidated Permit regulations. In our view, this amendment could work to destroy much of the stability of the current five year NPDES permit, rather than provide additional certainty through the ten year term. The change would put many NPDES permittees at a disadvantage compared to the present system.

Under EPA's current regulations, there are a number of situations which justify modification of an existing permit. A few are mandatory under the circumstances set forth in the regulations; others are permissive and can be triggered by a permittee. The causes which justify a permit modification are delineated at 40 CFR §122.15. In the introduction to this Section, the regulatory language states that, "if cause exists, the Director may modify or revoke and reissue the permit." (Emphasis added.)

Of greatest relevance to the proposed ten-year permit amendment, under the provisions of Section 122.15(a)(3), permit limitations based upon effluent limitations guidelines or water quality standards can be modified if the underlying guidelines or standards are changed. However, under the current regulations a permit writer's decision to reopen a permit is discretionary under these circumstances. Modifications are made at the request of the permittee and, thus, would not be automatically invoked. Section 122.15(a)(3)(i)(C) requires the permittee to, "request modification...within ninety (90) days after Federal Register notice of the action on which the request is based."

Looking at the issue more broadly, reopening and modifying a permit is a discretionary responsibility under all of the situations outlined in 40 CFR §122.15. As indicated above, the only mandatory reopener in EPA's current regulations is found at 40 CFR §122.62(b) and applies only to the health-based toxic pollutant standards

developed under the provisions of Section 307(a) of the Act. Section 122.62(b) of the regulations requires that:

> If any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in the permit, the Director shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or prohibition. (Emphasis added.)

This is the only mandatory reopener in effect at the present time since even the Section 122.62(c) reopener for implementing more stringent BAT effluent limitations guidelines developed for toxic pollutants under Section 301(b)(2) is not required for any permit issued after July 30, 1981 (40 CFR §122.62(c)(2)).

Summing up, under EPA's current regulations -- which Section 10 of the Administration's proposal builds upon -- modification of NPDES permits is not mandatory to incorporate: (1) the requirements of more stringent effluent limitations guidelines for conventional and nonconventional pollutants; (2) the requirements of more stringent effluent limitations guidelines developed for toxic pollutants under the provisions of Section 301(b)(2) for any permit issued after July 30, 1981; (3) water quality based requirements for conventional and nonconventional pollutants; and (4) water quality based requirements for toxic pollutants unless these requirements are developed under the provisions of Section 307(a).

To date, no one has made a statement of any sort during Congressional review of the Act, indicating that EPA's existing permit reopener provisions are inadequate. The changes in S. 431 are without basis in the Senate's hearing record.

However, as is obvious from the above review, a mandatory reopener provision, as envisioned in S. 431, is substantially broader than EPA's current regulations. The proposal raises four major concerns.

First, the paper industry -- as well as a number of other dischargers of conventional pollutants -- hold existing, or are currently negotiating, Best Professional Judgment (BPJ) permits which may be less stringent than the Best Conventional Technology (BCT) effluent limitations guidelines which will be issued in late 1983 or 1984. Under EPA's current regulations, these permits would be allowed to run out their five-year term before new permit limitations based upon the guidelines are required.

S. 431, by contrast, would require that dischargers of conventional pollutants immediately reopen existing permits upon publication of applicable BCT guidelines. This concern would be shared by any industry that is awaiting its BAT guidelines, and: (1) has a large number of BPJ permits issued after July 30, 1981; or (2) is currently negotiating BPJ permits for toxic pollutants not covered by Section 307(a).

Second, S. 431 would require that a permit be reopened each time a new water quality standard is issued that affects the permit. Under EPA's current regulations, this is not required for conventional, nonconventional, or toxic pollutants not regulated under Section 307(a). Section 122.62(b) of EPA's regulations would impose this requirement for health-based toxic standards developed under Section 307(a). The additional uncertainty created by extending this requirement to conventional pollutants (for which there are numerous applicable water quality standards), as well as nonconventional pollutants, outweighs any of the benefits or economies to be gained by a ten-year permit.

Third, the mandatory reopener and immediate applicability of new effluent limitations guidelines and water quality standards will require permittees to negotiate detailed compliance schedules each time a change is made. Under the current regulations, for conventional, nonconventional, and Section 301(b)(2) toxic pollutant control requirements, a permittee can utilize the remaining life of his existing permit to begin the process of complying with any such new requirements.

Fourth, the principal advantages -- indicated above -- of a longer permit term involve: (1) the savings in staff resources; and (2) a greater degree of certainty. However, the mandatory reopener, with no flexibility for EPA, included in S. 431 would significantly increase the manpower burden necessary to respond to new permit

requirements, and certainly decrease the certainty associated with holding an approved, fixed-term, five-year permit.

In summary, S. 431 would confound, rather than simplify, the NPDES permit process. The mandatory permit reopener in S. 431 would make a virtual shambles of the carefully crafted reopener provisions in EPA's Consolidated Permit regulations. Such a reopener -- passed by the Senate Committee with little discussion, and no data to support its sweeping scope -- would involve EPA, the states, and permittees in endless series of permit negotiations with little or no attendant environmental benefit.

API/NFPA strongly oppose this provision of S. 431. We urge the Subcommittee, during its deliberations, to revisit the straightforward Administration proposal on this issue. Section 10 of the Administration's 1982 bill removes the burden of unnecessary permit processing requirements, while still maintaining existing reopener requirements essential to assure environmental protection.

D. EPA Review of State-Issued NPDES Permits

Since the regulations implementing the NPDES program were first issued in the early 1970's, thirty five states have moved to take responsibility for administering the program and issuing NPDES permits. A number of these states now have almost ten years of experience with the program. Nevertheless, EPA still reviews and approves each state-issued NPDES permit. This dual review of state

NPDES permits often involves EPA, state agencies, and permittees in time-consuming two or three way negotiations over best engineering judgment types of permit conditions.

In many cases, the state agency permit writer who is most familiar with local conditions is in the best position to render a technically correct decision on a particular matter. EPA's review serves only to delay the process, and expend valuable federal and state agency staff time.

API/NFPA believe that the time has come to step back and take a look at the proper role that EPA should play in the day-to-day administration and oversight of state-administered NPDES programs. The NPDES program has reached a sufficient level of maturity at the state level so that EPA review and approval of every state-issued NPDES permit are no longer necessary.

Rather, for those states that have effectively administered the NPDES program for more than three years, EPA's responsibility should become one of conducting a periodic program audit, rather than reviewing and approving either all, or selected, state-issued permits. If the periodic program audit turns up instances of ineffective state permit administration, EPA should have the right (after a hearing) to: (1) withdraw the state's permitting authority; or (2) return to reviewing and approving each state-issued permit for a probationary period.

This change will have two important advantages. First, the program audit would eliminate much of the manpower burden incumbent on EPA review and approval of state-issued NPDES permits. At the same time, EPA would still be assured an effective oversight role in reviewing state administration of the NPDES program. Second, permittees would no longer be caught in "best engineering judgment" disputes between state and federal permit writers on permit conditions not subject to uniform national standards.

We would like to work with the Subcommittee in developing an approach that would provide an option for periodic EPA audits of state NPDES programs, in lieu of EPA review of state-issued NPDES permits.

At a minimum, we urge the Subcommittee to consider modifications to Section 402(f) to require EPA to implement this section of the Act. Under the current law, EPA is required by Section 402(f) to promulgate regulations which identify categories of point sources for which the Agency will waive its review and approval of state-issued NPDES permits authorized under Section 402(d) of the Act. Even though Section 402(f) was passed as part of the 1972 Act, EPA has never developed regulations to implement the Section, nor identified categories of discharges for which the Agency will waive its review of state permits.

We suggest the following modification to Section 402(f) to reaffirm Congressional intent that EPA move to implement the requirements of this Section in an expeditious fashion:

> [The] Not later than 180 days after the enactment of the Clean Water Act amendments of 1983, the Administrator shall promulgate regulations establishing categories of point sources which he determines shall not be subject to the requirements of subsection (d) of this section in any State with a program approved pursuant to subsection (b) of this section. The Administrator may distinguish among classes, types, and sizes within any category of point sources.

In addition, in the case of states where EPA must still approve transfer of the NPDES program, we recommend the following amendment to Section 402(e) to accomplish a similar purpose:

> In accordance with guidelines promulgated pursuant to subsection (h)(2) of section 304 of this Act, the Administrator is authorized, and shall consider waiving as appropriate in the case of each State submitting a program under subsection (b) of this section, to waive the requirements of subsection (d) of this section at the time he approves a program pursuant to subsection (b) of this section for any category (including any class, type or size within such category) of point sources within the State submitting such program.

IV. ISSUES OF CONCERN TO THE FOREST INDUSTRY RAISED IN H.R. 3282

As introduced, H.R. 3282 raises three major issues of concern to API/NFPA. These include: (1) Section 6 which deals with

water quality standards; (2) Section 9 which authorizes the formation of interstate conferences to protect water quality in estuaries; and (3) Section 10 which alters current Section 404 permit processing procedures. Our concerns with each of these issues are discussed below.

A. Water Quality Standards

1. Section 6 of H.R. 3282 Would Codify EPA's Existing Water Quality Standards Regulations

Section 6(a) of H.R. 3282 requires the states to maintain designated stream uses in effect on January 1, 1983 unless a state demonstrates that: (1) the existing use is not attainable because of natural background; (2) the existing use is not attainable because of irretrievable, man-induced conditions; or (3) application of controls beyond BAT/BCT in order to attain existing designated uses would result in substantial and widespread adverse economic and social impact. These requirements mirror those found in EPA's existing water quality standards regulations (40 CFR §35.1550(c)(3)).

Section 6(a) also requires states to: (1) identify those waters where existing water quality exceeds the level necessary to support the existing designated use; and (2) upgrade the current water quality standards to preserve this level of water quality. This proposal goes even further than a requirement, currently

embodied in Section 35.1550(c)(2) of EPA's water quality standards regulations, that states must upgrade standards to reflect achieved stream uses not included as designated uses.

Finally, Section 6(b) would amend the current law to codify EPA's current antidegradation policy found at 40 CFR §35.1550(e). The proposed amendment would also include EPA's Outstanding National Resource Waters program in statutory language.

As outlined in greater detail below, API/NFPA oppose codification of EPA's existing water quality standards regulations. We understand that EPA will shortly promulgate final revisions to the current water quality standards regulations. Consequently, we believe that any Congressional action, prior to a careful assessment of EPA's final rules, is premature.

2. Background on the Development of the Water Quality Standards Program and EPA's October 1982 Proposed Regulations

Section 6 of H.R. 3282 follows closely on the heels of approximately one year of public comment and controversy over the Environmental Protection Agency's October 29, 1982 proposal to revise the current regulations governing the way in which states set water quality standards (47 Fed. Reg. 49234). Before discussing the merits of either Section 6 of H.R. 3282, EPA's October 29 proposal, or EPA's upcoming modifications to the regulations, we believe a brief review of the background behind the water quality standards

program would be useful to set the basis for our current deliberations.

At the outset of this review, we wish to point out that API/NFPA and EPA share a similar interest -- as expressed by the thrust of the proposed rule, EPA's subsequent actions, and our comments filed with the Agency. This common goal is to provide the states with the proper flexibility to evaluate the feasibility and desirability of attempting to attain designated uses which, in certain cases, may: (1) have been inappropriately derived; (2) not reflect local water quality conditions; and (3) be very costly to attain.

As you know, water quality standards consist of designated uses and numerical criteria to reflect those uses. Designated uses should be defined in a fashion consistent with naturally occurring local conditions. There are, for example, segments of streams flowing from swamps that have never had a high dissolved oxygen level. States must have the latitude to reflect such conditions -- as well as others, such as seasonal variations.

Similarly, numerical criteria must be derived to reflect the needs of the aquatic community that could normally be expected to exist in a specific stream in the absence of pollution. For instance, numerical criteria must be calculated in a manner that accounts for the differing needs of a trout in Michigan and a smallmouth bass in Georgia.

20-955 O—84——107

Because of the natural differences in local requirements, EPA's emphasis on "uses" is the appropriate approach to measuring water quality. For example, dissolved oxygen levels above those which meet all needs of the local aquatic population serve no environmental benefit.

Neither we nor EPA support the alteration of existing stream uses, or the downgrading of designated uses that are technically and economically feasible to attain. Specifically, designated uses should not be removed to facilitate industrial expansion. Nor should we cease our efforts, where feasible, to achieve higher uses.

We understand the controversy caused by some of the language in EPA's proposal. Valid concerns were raised during the comment period. We understand that the Agency has substantially modified the proposed regulations to resolve these concerns.

However, looking back over the development of the current program, there is clearly a need for some modifications at the present time. When Congress passed the Federal Water Pollution Control Act in 1972, the statute placed primary reliance for the clean-up of the nation's waters on nationally-developed, technology-based, effluent standards. At that time, the state-of-the-art for site-specific regulation through water quality standards was such that the then-existing 1965 Clean Water Act was not achieving results as quickly as desired by Congress, EPA, or the general public. In fact, by 1972, a number of states had not yet commenced the development of standards for intrastate waters.

Thus, the 1972 Act required the development of technology-based guidelines for industrial dischargers to be implemented through the National Pollutant Discharge Elimination System (NPDES) permit program. The Act continued the water quality standards program because Congress recognized that, in some instances, technology-based guidelines alone would not be sufficient to clean up a stream segment entirely. States, after determining the location of these badly polluted stream segments would (under the framework of the 1972 Act) impose additional requirements in order to assure that these streams would move toward the 1983 goal of fishable and swimmable waters where attainable.

The legislative history of the 1972 Act contains many statements that water quality standards would remain an integral part of the clean-up program -- not to be used across the board instead, or after the application, of technology-based requirements -- but in conjunction with them as needed on a case-by-case basis. For example, the House floor manager for the Conference Report accompanying P.L. 92-500 indicated that, "it [Section 303] is intended to be a supplement to the 1977 and 1983 requirements." (Leg. History; 1972 FWPCA; Vol. 1; page 246)

Similarly, the Senate floor manager's statement accompanying the Conference Report noted that:

> The Administrator should assign secondary priority to this [Section 303] provision to the extent that limited manpower and funding may require a choice between a water quality standards process and early and effective implementation of the effluent limitation permit program. (Leg. History; 1972 FWPCA; Vol. 1; page 171)

In implementing the 1972 Act, EPA followed this directive, placing the lion's share of Agency resources against the formidable problems of: (1) implementing the NPDES permit program; (2) developing technology-based BPT and BAT effluent guidelines; and (3) administering the municipal construction grants program. Coupled with the limited stream data available in 1972, and the states' lack of expertise in standards setting, EPA's preoccupation with more pressing concerns resulted in the water quality standards program taking an understandable second priority to the other programs mentioned above.

This problem was compounded by the limited guidance that EPA did provide the states regarding the derivation of water quality criteria and the designation of stream uses to develop water quality standards. Often, this guidance was inflexible with respect to considering site-specific water quality conditions.

For example, in July 1978, EPA announced that the Agency would follow a policy of "presumptive applicability" for its laboratory-derived, Red Book water quality criteria. Presumptive applicability meant that a state had to adopt a criterion for a particular water quality parameter at least as stringent as the

recommendation in the Red Book unless the state was able to justify a less stringent criterion based on natural background conditions, more recent scientific evidence, or local site-specific information. The Red Book criteria were imposed upon the states even though they were never subjected to public or scientific peer review.

As a consequence of presumptive applicability of the Red Book Criteria, some states were forced into designating uses that do not, at the present time, reflect the capabilities of local waterbodies. In many cases, states were compelled to develop standards for stream segments before an adequate data base was developed to justify the action. While EPA officially withdrew the policy of presumptive applicability in November 1980, a number of EPA Regions still seem to apply the policy during the review of state water quality standards.

Thus, API/NFPA believe that the lack of water quality data and state expertise, combined with inflexible EPA guidance, resulted in the development of standards -- during the early and mid-1970's -- which often do not reflect site-specific stream conditions. To save time and avoid conflicts with EPA, states often extracted water quality criteria directly from EPA's Red Book criteria.

For example, at a December 14, 1982 EPA hearing on water quality standards, Harold Sawyer, the Administrator of the Water Quality Division of the Oregon Department of Environmental Quality stated that:

> I reject outright the assumption that standards that are adopted today were in all areas, every stream, every reach, adequate, based on sound data, because they were not. And if we then assume that because they were adopted you are somehow prohibited from factoring in the more specific data and adjusting those standards up or down to reflect the better data, because it is a downgrading or because it is something else, then we really have a problem with the program and the credibility of it.
>
> We find ourselves frequently trying to set priorities on that basis where there are procedural requirements in current regulation that tend to force you into some kind of a process now that doesn't gain anything but burns up resource. A review of standards on a statewide basis every three years is certainly not a very productive use of a very limited resource.

Thus, where it has occurred, this type of standards development has resulted in standards that exist on paper but are difficult to implement on individual stream segments. In some cases, these standards have been used as ambitious but ambiguous goals, rather than enforceable requirements. Some of these standards have been improperly derived. In a few cases, they were derived properly, but will be extremely difficult and far too costly to implement.

As we move beyond the broad-scale application of technology-based standards, to superimpose water quality-based permit requirements on individual stream segments, attaining these standards will be very questionable. EPA has made the same point at a House Water Resources Subcommittee hearing on water quality standards on February 23, 1983. Former EPA Assistant Administrator, Frederick A. Eidsness, Jr., stated that:

> Immediately after the passage of the 1972 Clean Water Act amendments, most States adopted fishable and swimmable use classifications for their rivers, lakes and streams. This was sometimes done without adequate analysis concerning what constituted a fishable use given the chemical, physical and biological characteristics of a particular water body. Experience has shown that, in some cases, a particular use, such as a trout fishery, cannot be attained because of hydrologic conditions or physical modifications of the stream. In some instances, the occurrence of pollution prevents the use from being attained.

Appendix B of API/NFPA's testimony provides case studies where improperly derived standards that are not reflective of local stream conditions were imposed through EPA's inflexible policies on water quality criteria. They also represent cases where increased technology, forced by incorrect standards, at increased cost, does nothing to protect the environment. The attached case studies represent examples where our industry has been directly affected by the problems EPA describes above.

Notwithstanding these start-up problems, the water quality standards program has and continues to evolve as EPA and the states gain more data and expertise. All 57 states and jurisdictions have approved water quality standards for commonly regulated pollutants such as Biochemical Oxygen Demand (BOD), ammonia, and phosphorus. Substantial additional data have been collected, providing the states with a longer and more detailed baseline for the development of site-specific criteria where needed.

For example, through the Section 208 planning process, the states have compiled considerable information on water quality conditions and problems on specific stream segments. The states' Section 305(b) reports have likewise resulted in the development of a substantial information base for identifying priority stream segments and developing site-specific criteria and standards. Finally, the states have collected a great deal of water quality data from: (1) industrial discharge monitoring reports (DMRs); and (2) federal, state, and industrial water quality studies for NPDES permit renewals, and for locating new sources. In short, a number of data collection programs which did not exist in 1972 now provide a part of the base for the development of more precisely derived, site-specific criteria, to form the basis for credible water quality standards.

Thus, API/NFPA believe that the program has matured to the point that states are now in a much better position to review and revise their standards in a technically sound fashion. The water quality data base that will drive the state review has had the benefit of ten years of further development. In the context of what the Act originally envisioned -- site-specific standards on priority segments to direct regulatory decisions in conjunction with technology-based controls as contemplated by Congress in 1972 -- the state agencies now, by and large, have the necessary experience and expertise.

We concur with the Association of State and Interstate Water Pollution Control Administrators' (ASIWPCA) testimony at a January 20, 1983 EPA hearing on water quality standards. ASIWPCA stated that:

> The states have now had more than ten years experience in water quality management using technology-based effluent requirements and water quality standards. During this time, the states accumulated substantial experience and data with which to develop defensible, credible water quality standards.

In summary, the water quality standards program must be addressed today in the context of a program that: (1) has not been subject to legislative oversight or scrutiny since 1972; (2) started slowly because Agency, Congressional, public, and industry resources were placed elsewhere; (3) progressed fitfully at times due to insufficient data, lack of agency expertise, and inflexible requirements sometimes forced upon the states; but (4) has, nonetheless, shown progress and evolved to the point where the states are ready, with additional guidance, to implement the next stage of the nation's water pollution control program.

The nature of this additional guidance is the subject of EPA's October 29, 1982 proposed regulations, EPA's more recent regulatory proposal, and Section 6 of H.R. 3282. We welcome these initiatives as needed opportunities to discuss the role of water quality standards (in site-specific regulation) after the implementation -- now near to completion -- of uniform, nationwide, technology-based controls.

As mentioned earlier, in revising the existing regulations which set forth the requirements for the development of state water quality standards, EPA initiated a review of regulations which have not been materially changed since November 1975. In revising and updating these regulations to reflect the maturation of the water quality data base, and state decision-making capabilities, it was not the Agency's intent to embark on a radical, new direction for the water quality standards program.

Indeed, in describing the October 29 proposal, EPA noted in the preamble to the regulations that:

> The proposed changes reflect experiences gained in the program by both EPA and the States. The changes increase the flexibility of the States to:
>
> - review and revise, as appropriate, water quality standards on priority water bodies or segments as necessary rather than reviewing all standards statewide every three years;
> - set site-specific criteria rather than adopt Section 304(a) criteria guidance;
> - remove or modify impaired uses based on analyses of the attainability of the uses and on benefit-cost assessments, if appropriate, rather than maintain use designations which cannot be met.
>
> These changes will enable States to use water quality standards as a pragmatic tool in improving water quality where necessary to protect water uses. (47 Fed. Reg. 49234)

Thus, EPA's proposal represents one attempt to reflect the evolution of the program by providing additional flexibility to

develop site-specific standards which reflect local water quality conditions on priority water bodies. However, neither the specific language, nor all of the concepts in EPA's proposal are sacrosanct. Rather, they are portions of an Agency proposal which has changed as the rulemaking proceeds. EPA's proposed regulations were subjected to considerable public and Congressional scrutiny as the Agency moved forward.

We understand that EPA will shortly issue final regulations which will: (1) respond to the more than 1400 public comments on the October 1982 proposal; and (2) resolve many of the public concerns raised by certain elements of EPA's October 1982 proposal. API/NFPA urge that <u>any</u> Congressional action in the water quality standards area be deferred until after the public has an opportunity to carefully analyze EPA's soon-to-be-issued final regulations. Moreover, the specific provisions embodied in Section 6 of H.R. 3282 would be particularly troublesome notwithstanding the awkward timing of this legislative proposal.

3. <u>API/NFPA Have Serious Reservations Over Section 6 of H.R. 3282</u>

a. <u>H.R. 3282 Would Reduce Administrative Flexibility and Further Delay the Implementation of Workable Water Quality Standards</u>

One major purpose behind EPA's October 29, 1982 proposal is to provide the states with sufficient flexibility to develop water

quality standards that are truly reflective of the needs and conditions of specific stream segments. As we note above, EPA's past lack of flexibility in this area has resulted in the state development of water quality standards that do not accurately represent site-specific stream conditions.

We are most concerned that statutory codification of EPA's present water quality standards regulations will: (1) delay the development of revised water quality standards by states as EPA struggles with a third revision of the program regulations -- this time to implement Section 6 of H.R. 3282; (2) set the basis for successive rounds of litigation which may move the water quality standards program in a direction not presently anticipated by the Subcommittee; and (3) discourage states from undertaking any revisions to current improperly set water quality standards because of a lack of federal consensus on an appropriate national policy in this area.

b. H.R. 3282 Would Eliminate the Administrative Flexibility for the States' Development of Site-Specific Water Quality Criteria

API/NFPA concur with EPA's decision to encourage states to develop site-specific criteria to reflect local conditions. EPA has properly concluded that the existing Red Book laboratory-derived criteria, developed under Section 304(a), do not always accurately reflect the adverse impact of a pollutant because of the effects of local water quality characteristics or the varying sensitivities of

local aquatic communities. In conducting this review, EPA has also recognized that adaptive processes may enable a viable, balanced aquatic community to exist in water with high natural background levels of certain pollutants.

EPA is likewise correct in concluding that the development of site-specific criteria is an important method of taking local conditions -- including variations in stream flows over time -- into account. This flexibility will ensure that the criteria developed by the states will be adequate to protect properly designated uses, but that they will not be more stringent than needed. EPA requires that any changes to existing criteria must be justified by acceptable scientific procedures.

API/NFPA believe that the advances, described earlier, in the states' capabilities and the water quality data base make EPA's October 1982 proposal a timely attempt to move the states toward a fuller utilization of the data that have been collected.

One indication of the capability of states to develop, and properly utilize, site-specific criteria is provided by the testimony of the Georgia Department of Natural Resources (DNR) at the December 7, 1982 EPA hearing on water quality standards. Leonard Ledbetter, Director of the Environmental Protection Division of the Georgia DNR indicated that the state:

> Has no intention of proposing or allowing changes in the Georgia Water Quality Standards which will in any way detract from the past progress in water pollution abatement in Georgia or in our plans for continued progress in the future. However, the proposed regulations will provide flexibility to Georgia and the other States to improve upon this progress. The flexibility to set site-specific criteria will enable the State to perform stream studies to establish scientifically defensible criteria in a small South Georgia stream with a dissolved oxygen level of 3.4-4.0 mg/l, the proposed regulations will allow this criteria to be established for this stream, but only after the appropriate studies, public hearings and Environmental Protection Agency approval. This, in turn, may permit a city to use a conventional water pollution control facility to achieve the fishing classification rather than invest in expensive advanced treatment facilities to achieve the same result.

We are concerned that the thrust of Section 6 will discourage the states from moving toward the development of site-specific criteria, and instead encourage the indiscriminate application of the nationwide, Red Book criteria. H.R. 3282 does not reflect the site-specific nature of the uses and capabilities of individual stream segments. Rather, the proposed amendment retains the program's unfounded past emphasis on the implementation of uniform standards throughout the country. By making it more difficult for the states to modify existing standards, H.R. 3282 would effectively destroy much of the momentum and effort expended toward assisting the states to develop site-specific water quality criteria.

c. H.R. 3282 Would Substantially Shift the Emphasis of the Current Program from the Maintenance and Achievement of Designated Stream Uses to the Preservation of All Measures of Ambient Water Quality

Section 35.1550(c)(2) of EPA's current water quality standards regulations requires that:

> The State shall maintain those water uses which are currently being attained. Where existing water quality standards specify designated water uses less than those which are presently being achieved, the State shall upgrade its standards to reflect the uses actually being attained. (Emphasis added.)

API/NFPA support this requirement, and urged its inclusion in EPA's final revisions to the October 29, 1982 proposal. We understand that EPA has decided to retain this provision in its soon-to-be promulgated final rule. Such a requirement will be necessary to capture, in water quality standards, those stream uses which will be realized as industry installs BAT/BCT technology, and municipalities achieve secondary treatment.

Section 6 of H.R. 3282, however, imposes a substantially different requirement. Section 6 would amend the current Act to assure that:

> Each State shall identify those waters within its boundaries the quality of which exceeds the level necessary to support the designated uses contained in any existing water quality standard applicable to such waters. The State shall revise any such water quality standard with respect to waters so identified as necessary to preserve such quality. (Emphasis added.)

This proposal would eliminate EPA's emphasis on the protection of designated uses. It would, instead, require the states to preserve all numerical measures of ambient water quality, irrespective whether the increment of water quality in question contributes in any way to the maintenance of either existing or potential stream uses. In a stream where all organisms can flourish with a dissolved oxygen (DO) limit of 5.0, an 8.0 DO is no more useful than a 7.0 DO. Such an approach would mandate the preservation of water quality for its own sake without regard to the needs of the local aquatic community.

d. H.R. 3282 Would Confound Implementation of EPA's Antidegradation Policy

Section 6 of H.R. 3282 contains the first specific statutory Clean Water Act language for an antidegradation policy. The proposed statutory language is virtually identical to the current regulatory policy for antidegradation found at 40 CFR §35.1550(e)(2) of EPA's present water quality standards regulations. The Agency maintains that the statutory basis for the current antidegradation policy is found in Section 101(a)(1) and Section 303(c)(2) of the Act. Since 1975, EPA has sustained this policy, as authorized by the statute, in the face of at least one unsuccessful legal challenge. The states have included the policy in their water quality standards.

Notwithstanding this record of progress in implementing the current regulatory antidegradation policy, statutory codification of

EPA's existing regulations raises a number of concerns with respect to the likely flood of litigation that will follow EPA's attempt to interpret and implement this new statutory requirement. For example, under EPA's current regulations, the designation of Outstanding National Resource Waters is a discretionary responsibility that the states may choose to implement. Under the requirements of Section 6, however, it is not clear that this represents a discretionary responsibility. In addition, Section 6 is vague with respect to most other aspects of the implementation of this new program.

In our view, the need for statutory codification of EPA's antidegradation policy has not been demonstrated. API/NFPA urge the Subcommittee to delete this portion of Section 6.

B. Estuarine Protection

Section 9 of H.R. 3282 amends Title III of the current Act to establish a mechanism to convene state and interstate management conferences designed to provide additional water quality protection for estuarine areas. API/NFPA do not object to the basic thrust behind this proposal. However, we have two concerns with the specific language included in Section 9.

First, we believe that the estuarine management conferences envisioned in the proposal should be convened at the call of one or more of the states responsible for the protection of water quality

20-955 O—84——108

in the estuary in question. The formation of a conference should then be subject to the approval of the Administrator. In light of EPA's review and approval of state NPDES permits, water quality standards, and local municipal waste treatment programs, we see no need for EPA to have the authority to unilaterally trigger an interstate conference mechanism. Giving states some responsibility in convening the conference will also assure that estuaries with significant problems are chosen.

Second, API/NFPA believe that Section 9 should be clarified to specify that the recommendations provided by the estuarine management conferences shall not contravene state NPDES permits, water quality standards, or nonpoint source control programs. The state or states in which the estuary is located should have the primary responsibility for implementing the recommendations of the conference in concert with existing state water quality programs. Disputes over interstate estuaries should be resolved through existing procedures already provided in Section 401 and Section 402 of the Act. Finally, the findings and recommendations of any management conference should be coordinated with the existing planning programs authorized under Sections 201, 208, 209 and 303 of the current Act.

C. <u>The Section 404 Dredged or Fill Permit Program</u>

Section 10 of H.R. 3282 would amend Section 404 of the current Act in two significant respects. First, Section 404(b)

would be amended to include a new statutory criterion for evaluation of a Section 404 permit application. This criterion is patterned after a standard of review currently embodied in 40 CFR §§230.1(c), 230.10(a), and 230.10(c) of EPA's December 24, 1980 Section 404(b)(1) environmental guidelines.

Second, Section 10 would amend Section 404(q) of the current Act to write into law, permit processing procedures similar to those required by March 1980 Memoranda of Agreement among the federal agencies involved in the review of Section 404 permits (i.e., the Army Corps of Engineers, EPA, the U.S. Fish and Wildlife Service, and the National Marine Fisheries Service). This amendment is apparently designed to reflect Congressional disfavor with July 1982 revisions to the March 1980 MOA's. The relevant agencies processed these revisions after receiving public comments on opportunities to streamline the permit program.

API/NFPA oppose such changes at this time. As the Subcommittee knows, API/NFPA have been deeply involved, since 1975, in the implementation of the Section 404 program. We have testified on this program in 1975, 1976, 1977, and 1979.

As a result of this Subcommittee's efforts in 1977, many normal forestry, farming and ranching activities are currently exempt from Section 404 permit requirements. Therefore, our industry faces neither the degree of exposure to the program that we did in the past, nor the exposure presently faced by some other industry groups.

We support much of the current effort to make the Section 404 program more efficient through the regulatory reform initiatives undertaken by this Administration. We believe, however, that legislative change to the Section 404 program is premature at this time. The regulatory reform process should run its course. The program needs a period of relative administrative stability before a comprehensive Congressional review is begun.

Legislative action on Section 404 may ultimately be necessary. However, we believe that efforts to address the program in a piecemeal fashion will only complicate an already controversial federal regulatory effort. Unfortunately, the two amendments contemplated in Section 10 of H.R. 3282 would have just this effect.

For example, Section 10(a) would write into law <u>one</u> of the standards of review that field level permit writers must apply against permit applications. Such an amendment would presumably elevate this particular standard above all the other criteria and findings that make up a Section 404 permit review. Moreover, by moving this standard of review from Corps enforcement policy to a statutory requirement, Congress would eliminate all flexibility for a field level permit writer to balance conflicting concerns in a permit decision. Finally, establishing a new statutory standard of review will undoubtedly result in a substantial increase in litigation over Corps Section 404 permit decisions.

Section 10(b) would amend Section 404(q) to freeze indefinitely interagency procedures for permit review that are still evolving toward increased environmental effectiveness and administrative efficiency. Congress originally passed Section 404(q) in 1977 to indicate Congressional concern over the length of time required to process Section 404 permits. Section 404(q) required the federal agencies involved in reviewing Section 404 permit applications to develop Memoranda of Agreement with the Corps of Engineers to expedite the processing of Section 404 permits. To the extent feasible, permit decisions were to be made within 90 days of permit application.

Unfortunately, these Memoranda of Agreement were not first issued until March 1980. Even then, their impact in reducing Section 404 permit processing time was questionable. In July 1982, the Subcommittee heard considerable testimony on the Section 404 program. Reviewing the permit processing statistics submitted by environmental group witnesses during these hearings, we note that there has been no significant reduction in average permit processing time from fiscal year 1977 through fiscal year 1981.[1]

---

[1]See, for example, the July 28, 1982 statement before the Subcommittee of Hope M. Babcock, Deputy Counsel of the National Audubon Society. Table 4 of the statement provides average permit processing times for FY 1977-FY 1980. These data provide three interesting pieces of information: (1) average processing time has not changed significantly since before passage of the 1977 Act; (2) even after deleting permits which require EIS's, the average time is still substantially in excess of the 90 days established as a goal by Section 404(q). Permits which require EIS's are, by far, the most time consuming, and would raise the average processing time further; and (3) while the March 1980 MOA's had no appreciable effect on reducing the average permit processing time, the number of relatively time-consuming, "controversial" permits increased significantly after issuance of the MOA's.

The July 1982 revisions to the MOA's were one attempt to fulfill the mandate of Section 404(q) to reduce permit processing time. As the agencies gain more experience with the program, it is ineluctable that permit processing procedures will, and should, continue to change. We believe that the proposal in H.R. 3282, to freeze into law, one set of procedures will significantly reduce the administrative efficiency of the Section 404 program, as well as the ability of the agencies involved in its implementation to respond to changing circumstances.

In sum, we believe that both of the proposals in Section 10 to amend the Section 404 permit program are ill-founded. Both proposals delve into areas of administrative procedure where Congressional mandates are least efficient, and agency discretion is most necessary. We urge the Subcommittee to defer action on this issue pending a comprehensive review of the effectiveness of the Section 404 program -- perhaps conducted by the full Committee's Investigation and Oversight Subcommittee.

V. H.R. 4037 AND THE CONTROL OF NONPOINT SOURCES OF POLLUTION

One issue that has already received considerable discussion during the current Congressional review of the Act involves the control of nonpoint sources of pollution. The Senate Committee reported a measure designed to provide federal financial support to states in order to assist the implementation of nonpoint source

control programs. H.R. 4037, introduced by Congressman James Oberstar, takes a similar approach. We anticipate that other alternatives will be discussed as the Subcommittee's deliberations proceed.

Our commitment to reasonable nonpoint source control programs has been reflected in our support for the Section 208 planning process under the 1977 Clean Water Act. We are interested in controlling nonpoint source pollution in order to: (1) foster good forest management; and (2) avoid, at our manufacturing facilities, unnecessary treatment -- beyond Best Conventional Technology -- for Biochemical Oxygen Demand and suspended solids on streams where uncontrolled nonpoint sources contribute to these water quality problems.

Much of the interest in the water quality impacts of forestry activities has been focused, in recent years, through the Clean Water Act's Section 208 program. Through Section 208, EPA fostered active programs in a number of states to: (1) assess the impacts of forestry activities on water quality; and (2) devise management practices and control programs, where necessary, to achieve water quality goals.

The results of state Section 208 planning efforts to date have shown considerable variation in programs from state to state. This variability makes it very difficult to draw any generalizations

about the 176 areawide and 49 state Section 208 planning programs. However, based upon the data base developed as a result of the Section 208 planning process, we believe that a general perspective on the water quality impacts associated with silviculture activities has been gained by EPA, the states, and the forest industry.

A. Impact of Forestry Activities on Water Quality

In general, water from forest lands is of high quality and supports the most sensitive water uses. For example, almost all western, and most eastern, cities have municipal water supplies in forested areas. In addition, trout and salmon fisheries depend upon high quality water from forested watersheds.

Based on existing water quality data, which in many cases are admittedly still incomplete, silvicultural activities have not been considered a major, overall, nationwide water quality management issue. However, forest management practices which potentially impact water quality on a localized basis are recognized. These difficulties are usually caused by improper application of forestry practices such as logging road construction, skid trail location, and certain types of site preparation for replanting trees. However, the type and severity of the problems, as well as the nature of the particular silvicultural activity causing the difficulty, vary considerably from state to state due to topography and other local conditions. There is considerable variability even within states in some areas.

In most cases, sediment is considered the primary source of pollution from forestry activities. However, the 1978 study report of the Society of American Foresters' Clean Water Act Task Group indicates that sediment from forest lands is estimated to be less than 4% of the total man-caused sediment in the nation's water. This is particularly significant considering that there are 718 million acres of forested land in the United States, constituting approximately one-third of the total land area.

A reflection of the magnitude of the problem caused by silviculture is the fact that only ten of the 225 Section 208 planning agencies, in their initial problem assessment, identified forestry activities as a priority problem to be addressed by the Section 208 program. In other cases, Section 208 planning agencies have identified either problems which are geographically localized, or problems caused by specific types of activities. While not priority problems, these localized difficulties were addressed during the Section 208 planning process.

B. Forest Industry Involvement in the Development of Nonpoint Source Control Programs Under Section 208 of the Clean Water Act

In November 1975, EPA issued the first in a series of regulations and guidance materials that required the states to utilize the Clean Water Act's Section 208 planning process as the primary mechanism for addressing nonpoint source pollution problems from silviculture, as well as from a number of other sources (40 Fed. Reg. 55335). Since the development of these EPA policies,

the forest industry has assisted in the implementation of the Section 208 process nationally, regionally, and on a state-by-state basis. Nationally, API/NFPA have maintained an active program dealing with Section 208 planning since 1975.

From an industry perspective we feel that our involvement with EPA and other agencies at the national level has been positive in terms of working toward reasonable and effective Section 208 programs. One index of the nature of our involvement at the national level is that API/NFPA supported reauthorization and continued appropriations for the Section 208 program, through the completion of Section 208 plan development in 1980.

In addition, API/NFPA have developed a cooperative research program on forest practices and water quality with the National Council of the Paper Industry for Air and Stream Improvement (NCASI). At your later hearihg on nonpoint sources, we would like to share some of the most recent results of our resaerch contained in NCASI's January 1983 report, "Summary of Silviculture Nonpoint Source Control Programs - 1982." This report provides the best information available from any source on the current status of Section 208 silviculture programs in the various states.

At the regional level, a number of forestry associations have organized forestry involvement in the Section 208 process, and provided a forum for the exchange of information on the progress of Section 208 planning in each state. However, due to the nature of

the Section 208 program, most of the action has taken place at the state level. In almost every state with a substantial forest land base, the forest industry has contributed to the Section 208 planning process by providing its expertise, cooperating in assessment studies, and even funding studies of management options.

There are almost as many different varieties of Section 208 programs for silviculture nonpoint source control as there are states that worked with the silviculture category. The variation in these programs strongly reflects: (1) the nature, type, and extent of the problem identified in each state; (2) the nature of the ownership of the forest land base; (3) the differences in analyses as to the most effective way to reach those operators or landowners causing the problems; and (4) the nature and effectiveness of existing institutional arrangements for implementation in each state. With at least this many variables to consider, the differences in the types of state programs adopted should come as no surprise.

Our involvement with the Section 208 program, NCASI's research in this area, and our review of a number of legislative proposals introduced to date, suggest at least nine discreet issues which must be considered in framing any new federal initiative to deal with nonpoint source pollution. Below, we review each of these issues in an attempt to assist the Subcommittee in drafting a broadly acceptable, and workable nonpoint source pollution control amendment.

C. Questions Which Must be Addressed in Framing New Federal Initiatives on Nonpoint Sources

1. Should Additional Federal and State Efforts to Control Nonpoint Source Pollution Build on the Section 208 Planning Process?

It is our position that the completed Section 208 nonpoint source control plans should, to the extent possible, serve as a springboard for further development and implementation of nonpoint source management practices. In most cases, state plans developed through the Section 208 process represent the most comprehensive available assessment of: (1) nonpoint source problems in each state; (2) needed controls to deal with these problems; and (3) viable institutional arrangements for implementing these controls.

We would be reticent to endorse a new round of planning to guide nonpoint source control implementation activities. Indeed, NCASI's survey of state silvicultural nonpoint source control programs indicates that forty states are already moving forward to implement the programs they developed through the Section 208 process. We understand that similar results in the agriculture area have been obtained through a survey (conducted by the National Association of Conservation Districts) of state agricultural nonpoint source control programs. We would be reluctant to see this progress interrupted by the interjection of a completely new federal nonpoint source pollution control initiative.

While the Section 208 data base may need to be supplemented in certain areas, it is (as indicated) the best information source available at the present time. It should, thus, serve as the foundation for any efforts initiated by the Subcommittee through new legislation this year. API/NFPA recommend that any legislation reported by the Subcommittee to the House specify that state and federal nonpoint source control efforts should build upon the Section 208 plans developed by the states, and approved by EPA.

2. Should the Federal Government Step-In to Implement Nonpoint Source Controls Where States Do Not Act in a Timely Fashion?

One element common to a number of proposals advanced to date is the proposition that the federal government would directly implement nonpoint source controls in a state which does not develop an appropriate program under whatever conditions are specified in these legislative options. API/NFPA strenuously object to this sort of federal step-in as a remedy for state inaction.

One important finding of the Section 208 effort is that the nature and variability of nonpoint source problems and needed control measures dictate that control programs must be developed and implemented at the state and local level. In our view, there are very real institutional and resource limitations that would be faced by EPA or any other federal agency attempting to implement, monitor, and enforce nonpoint source controls at the state level. These limitations make direct federal implementation of nonpoint source

control programs infeasible, even in cases where states are, for some reason, unwilling or unable to act.

Quite apart from the issue of the federal government's questionable capability to implement a program in place of a state, we wonder whether speculation over the possible inaction of a state or states is a real concern. As indicated, forty states are moving forward in the silviculture area in the absence of any federal assistance whatsoever. The recent NACD survey demonstrates a similar degree of state and local commitment in the agricultural area.

The principal impediment to more aggressive efforts to control nonpoint sources over the past three years has not been a lack of state or local interest. Rather, efforts have slowed to some extent because of a perceptible lack of federal support, encouragement, and/or financial assistance to augment state and local efforts.

In this light, we believe it is, at best, premature to threaten heavy-handed federal intervention or sanctions in states which for some reason fail to move forward as fast as many would like. First, the threat of direct federal intervention to implement nonpoint source controls rings hollow in light of the lack of federal capability to perform this function. Second, it is not at all clear that this is the only, or even the best, means of inducing reluctant states -- if there are any -- to move forward in an expeditious fashion.

API/NFPA suggest an alternative role for EPA in this process. We believe that the Administrator should review the status of nonpoint source problems in those states which fail to submit an implementation plan under whatever proposal the Subcommittee finally adopts. The Administrator should report to Congress within eighteen months assessing: (1) the need for additional nonpoint source controls in these states; and (2) appropriate federal remedies as a result of the states' failure to act.

3. Is Federal Financial Support Necessary to Foster the Implementation of Nonpoint Source Controls?

Our industry survey of the current status of state silviculture nonpoint source control programs indicates that a major impediment to more rapid implementation of nonpoint source controls is the lack of available financial and staff resources at the state level. Indeed, ten of the forty states which are actively implementing a silviculture nonpoint source control program responded that lack of federal financial support, as Section 208 grants are phased-out, will slow down their efforts.

Major federal financial assistance to the states for dealing with nonpoint source problems ended in 1980 with the completion of the Section 208 planning process. Since that time, there have been limited federal financial measures provided to the states to help implement specific Section 208 plan elements. In our view, given the current limitations on resources at the state and local level,

some degree of federal financial assistance will probably be necessary to: (1) help states refine implementation plans, where necessary; (2) implement the education, training, technology-transfer, and other programs designed through the Section 208 planning effort to get best management practices implemented on the ground; and (3) in some limited cases, cost-share the actual implementation of best management practices.

In the silvicultural area, we believe the principal need for financial assistance is to aid the states in implementing education, training, and technology-transfer programs. We would not anticipate a great deal of cost-sharing for actual implementation of best management practices, since silvicultural best management practices do not generally involve extensive capital costs. However, there may be a substantial funding need of this nature in the urban and agricultural areas, where capital expenditures are often involved in nonpoint source control measures.

We appreciate the current lack of hard information concerning the total financial resource commitment necessary to effectively address nonpoint source problems nationwide in order to achieve the goals of the Act. API/NFPA do not believe that we should embark on a massive grants program analogous to the municipal construction grants effort. At the same time, we believe that a larger federal commitment, at the present time, would be helpful to serve as "seed money," to assist states in commencing or enhancing implementation efforts.

We would not, however, object to a more limited interim federal involvement (perhaps on a case study basis) designed to generate a more accurate assessment of the total, national nonpoint source control resource needs. Any such interim measure should be fashioned so that: (1) results are obtained on a timely basis; and (2) a comprehensive report to Congress concerning the appropriate federal role is provided no later than three years from the date of passage of the Clean Water Act amendments currently before the Subcommittee.

4. Beyond Financial Support, What is the Appropriate Federal Role in Addressing Nonpoint Source Pollution?

API/NFPA believe that the implementation of nonpoint source control programs should remain a state and local responsibility. However, there is an appropriate role (in addition to providing financial assistance) for the federal government in this process.

The Environmental Protection Agency should continue to review and approve state nonpoint source control programs in order to: (1) assure reasonable state progress toward meeting water quality goals; (2) guard against unwise expenditure of federal financial resources in supporting state programs that are poorly conceived and/or operated; and (3) resolve any interstate disputes concerning nonpoint source problems. With respect to the latter responsibility, we support special studies designed to deal with unique interstate nonpoint source problems such as the pollution of

20-955 O—84——109

the Chesapeake Bay. In our view, EPA should also serve as a clearinghouse for the transfer of information on successful implementation programs at the state level.

Finally, EPA should assess the progress being made, and keep Congress abreast of needed changes to the federal strategy for dealing with nonpoint sources. This responsibility should include, as suggested above, a requirement for EPA to report to Congress where states do not act to address nonpoint source problems.

In addition to EPA, we believe that the U.S. Department of Agriculture has an important role to play in addressing nonpoint source problems. USDA should provide technical assistance, where appropriate, to assist state implementation of nonpoint source control programs. USDA's expert agencies and delivery systems for dealing with the agricultural community will prove essential in assisting the states to move forward in addressing water quality problems caused by agricultural activities.

Finally, we believe that all federal agencies have a responsibility to work closely with state nonpoint source control implementation agencies to make sure that federal programs are consistent with state efforts in this area. The federal government should not unwittingly cancel out the effects of state nonpoint source control efforts as the result of poorly coordinated federal projects or programs.

5. Should States Be Bound to a Uniform, Nationwide Date By Which Nonpoint Source Controls Must Be in Place?

Another important finding of the Section 208 planning effort is that the variability of nonpoint source problems from state to state -- and even within states in certain areas -- requires a policy that provides the states with considerable flexibility in controlling nonpoint source pollution. In our view, the most important components of this policy include the flexibility to develop: (1) different types of control programs, both regulatory and non-regulatory; (2) schedules for achieving implementation milestones that reflect the necessary differences in these control programs; and (3) economically and technically feasible best management practices that will be applied in a site-specific fashion.

In light of this diversity in types of control programs, we have considerable difficulty with the requirement, advanced in a number of proposals, that all states must implement nonpoint source controls within forty-eight months (or by some other arbitrarily chosen, uniform date). The local variability of nonpoint source problems makes it imperative that states be afforded varying time schedules to implement necessary controls.

We believe that a uniform deadline for compliance could well have a chilling effect on the states' willingness and ability to consider a broad range of alternative implementation programs. Such

a deadline runs a very real risk that the states will identify only those problems for which they are certain they can achieve compliance within the forty-eight month deadline.

API/NFPA prefer a less extreme option than attempting to impose nationwide nonpoint source controls within forty-eight months -- an approach which appears to represent "point source" thinking. We suggest that each state program submitted to EPA for approval include a schedule of accomplishments -- agreed upon by both the state and the Administrator -- for the implementation of the nonpoint source controls specified in the state plan. By monitoring the state's progress in achieving these milestones, we believe that EPA will have adequate opportunity to assure that the state is moving forward on a timely basis, in a fashion that is reflective of each state's particular nonpoint source problems. This approach will result in a more honest appraisal of the nonpoint source problems in each state, as well as a more sincere effort to deal with these difficulties.

6. Should the Nation's Nonpoint Source Pollution Control Strategy Continue to be Premised on the Implementation of Best Management Practices?

Since November 1975, EPA has emphasized the control of nonpoint source pollution problems through the implementation of best management practices (BMP's) (40 Fed. Reg. 55338). EPA's approach to developing best management practices to protect water

quality has fostered the concepts that: (1) states, as opposed to federal agencies, will determine whether a practice is indeed a BMP; (2) alternative practices will be examined; and (3) such practices must be technically and economically practicable before they will be adopted.

EPA's approach has also supported the notion that the application of best management practices must be tailored to site-specific conditions. BMP's may, therefore, vary from site to site depending on the nature of particular silvicultural activities and related potential water quality problems. Finally, EPA's approach to BMP development encouraged the utilization of existing forestry expertise in the development of best management practices. This aspect of the BMP development process was essential in securing technically feasible BMP's.

Our experience in working with Section 208 agencies at the state and local level to develop BMP's has been positive. The states that addressed silviculture nonpoint source pollution developed their BMP's in conjunction with the forestry interests in each state. These BMP's meet the regulatory criteria for BMP development set forth by EPA in 1975. It is our understanding that best management practices were developed in a similar fashion in the agricultural area. Because EPA, state, and local Section 208 planning agencies framed BMP's that are both workable, as well as politically acceptable, we are now in a position to move forward to implement needed controls.

In this light, we are most concerned about proposals to replace the best management practice approach with some form of an "average practice" alternative using the standard practice being carried out by the majority of landowners in an area. This option does not appear to emphasize the site-specific nature of nonpoint source controls, or the need for professional judgment in implementing the necessary practices.

Moreover, such an alternative approach would lose the political support for implementation of best management practices generated by the Section 208 planning process. API/NFPA, thus, urge that any new nonpoint source initiatives favorably considered by the Subcommittee retain the concept of best management practices as the appropriate means of dealing with nonpoint source pollution problems.

7. Can Financial Sanctions Be Used Effectively to Compel Compliance with Nonpoint Source Pollution Controls?

One suggestion discussed at some length during Senate Committee consideration of this issue involves cutting off federal financial assistance for any activity not conducted in compliance with required nonpoint source pollution control practices. On the surface, this proposal appears appealing because it does not involve any additional federal financial exposure. Indeed, such an approach could work to reduce the amount of federal financial assistance provided through various federal support programs.

In our view, however, the appeal of such an approach is largely superficial. The element of compulsion injected by such proposals for financial sanctions conflicts with current EPA policy under Section 208 to foster cooperative programs to implement nonpoint source controls. Experience with the Section 208 program suggests that an approach which emphasizes education, training, and, where necessary, incentives, offers the best chance of success -- especially in dealing with rural nonpoint source problems. A controversial sanctions program may make states reluctant to honestly identify problems and develop control programs.

In addition, such a proposal could have an unanticipated negative effect on water quality. For example, this type of approach could be interpreted to prohibit federal construction grants for waste treatment facilities to municipalities that do not develop urban runoff control programs. Similarly, many nonpoint source control efforts in the agricultural sector depend on USDA soil conservation and extension assistance as part of the necessary delivery mechanism. However, such federal assistance programs would presumably be denied to farmers that have not promptly implemented agricultural nonpoint source controls.

Moreover, such a proposal would obviously require detailed guidance as to: (1) how such a complicated sanction would be implemented and enforced in a justified fashion by the myriad of federal and state agencies involved; and (2) the specific federal assistance programs affected. We believe that a detailed analysis

of current federal assistance programs would be necessary to even begin to consider this type of sanctions approach.

Finally, such an approach assumes that affected federal financial assistance provided through various programs is not directed in a fashion that is designed to achieve other important national purposes. We see no justification for the apparent presumptive desirability of implementing nonpoint source controls, over the other national goals served by affected federal financial assistance programs. The conflicts that would be created with these programs may require broader legislative review than can be provided within the jurisdictional purview of the Public Works and Transportation Committee.

As an alternative to this controversial approach, API/NFPA support, as indicated above, efforts by federal agencies to work with states to assure that the federal programs are consistent with state nonpoint source control efforts. More generally, we believe that positive initiatives rather than financial sanctions against nonpoint sources will have the greatest impact on improving water quality.

8. Should Nonpoint Source Control Efforts Be Concentrated on Priority Water Bodies?

One issue common to a number of the proposals that have been discussed is whether new nonpoint source control efforts should be

concentrated on water bodies where nonpoint source pollution is creating a significant water quality problem. As indicated below, current data are not adequate to directly correlate specific nonpoint sources with water quality standards violations. However, the current state Section 305(b) water quality surveys provide sufficient information to identify those water bodies where nonpoint sources are an important water quality problem.

Consequently, API/NFPA believe that control efforts should not be focused on all water bodies with water quality problems. Rather, new initiatives should concentrate on those water bodies identified through Section 305(b) surveys (or other data sources) on which nonpoint sources are interfering with the achievement of the Act's clean water goals. Both federal financial assistance, as well as any state efforts, should give priority to those water bodies on which nonpoint source controls are most immediately needed.

9. Are Current Data Adequate to Correlate the Implementation of Nonpoint Source Controls with the Attainment of Water Quality Standards or to Resolve Interstate Nonpoint Source Water Quality Problems?

While existing data are adequate to begin the implementation of nonpoint source controls on priority water bodies, we still have much to learn about the relationship between the implementation of best management practices and improvements in measures of ambient water quality. Clearly, data gaps also exist in determining natural background levels of some nonpoint source pollutants, and in

quantifying the impact of long range transport of pollutants as part of the bedload that already exists in most stream systems. Because of these information gaps, we believe that new nonpoint source initiatives should not be confounded by attempting to address issues where insufficient decision-making data exist, such as: (1) nonpoint source compliance with water quality standards; and (2) conclusively resolving interstate conflicts over long-range transport of nonpoint source pollutants.

We believe that a program focused on implementation of nonpoint source controls on priority water bodies is an important beginning for the long-range task of improving and protecting the nation's waters impacted by nonpoint source pollution. What such a program cannot do, however, is solve all of our water quality problems in short order.

D. API/NFPA Support H.R. 4037 with Modifications

As introduced, H.R. 4037 favorably responds to many of the concerns discussed above. The program framed by H.R. 4037 represents a positive step forward in the federal/state partnership to deal with nonpoint source problems. API/NFPA support H.R. 4037, with the two following modifications.

First, H.R. 4037 would add new Sections 319(a)(7) and 319(c) to the Act requiring states to: (1) identify federal activities which would be "inconsistent" with the state nonpoint source implementation program; and (2) recommend modifications to these federal activities. EPA would consolidate the state recommendations, and submit them to the appropriate federal agency. Finally, the affected agency would modify its activities, and "to the extent possible," carry them out in a manner that is consistent with the state program.

As indicated above, API/NFPA support the basic proposition that federal programs should be consistent with state nonpoint source control efforts. However, we are concerned that the proposal framed in H.R. 4037 contains ambiguous requirements which could result in substantial resource and program burdens on federal agencies.

For example, it is unclear how the term "inconsistent" would be defined for the purposes of identifying affected programs. Similarly, it is not apparent why EPA should serve as a clearinghouse for state recommendations, or whether other federal agencies would be bound by EPA's interpretation of the states' requests. Finally, we are uncertain as to how the requirement to carry out federal programs, "to the extent possible...in a manner which is consistent with" state desires would be interpreted by EPA or the courts.

To provide a greater degree of certainty in the specific federal program requirements imposed through this type of a provision, we prefer the approach outlined in Sections 319(a)(1)(G) and 319(f)(1) of S. 431 as reported by the Senate Committee. S. 431 references, and gives special deference to, existing federal/state program coordination procedures outlined in Executive Order 12372. In this fashion, a good deal of uncertainty concerning the specific requirements of this portion of the nonpoint source proposal is eliminated.

Second, proposed Section 319(h) of H.R. 4037 would provide the authority for EPA to convene interstate management conferences to deal with nonpoint source problems that affect more than one state. API/NFPA support the special conference approach to dealing with interstate problems. However, we are reluctant to endorse the proposition -- as H.R. 4037 appears to do -- that such conferences should be granted plenary enforcement authorities to modify existing state permits and/or plans. Such a proposal would make chaos of existing programs. More data on long range transport of nonpoint sources much be collected before interstate problems can be resolved in such a compulsory fashion.

VI. ADDITIONAL ISSUES OF CONCERN TO API/NFPA

In addition to our own legislative priorities, and issues raised in H.R. 3282 or H.R. 4037, two issues of substantial concern

to API/NFPA have been raised during Senate deliberations on Clean Water Act amendments. These are reviewed below.

A. Antibacksliding

S. 431, as reported by the Senate Committee, contains an amendment offered by Senator David Durenberger, designed to deal with the maintenance of existing NPDES permit conditions. Section 13 of the bill would amend the NPDES permitting authority in Section 402 of the Clean Water Act to prohibit renewed or reissued permits from containing effluent limitations or other conditions less stringent than the previous permit.

This amendment would strike down a provision in an EPA November 18, 1982 proposal implementing the settlement agreement on the Consolidated Permit regulations. Under this proposal, the EPA Administrator would have the option to revise BPJ permit limitations when subsequently promulgated effluent limitations guidelines are less stringent.

The Agency's rationale for this proposed change is as follows:

> EPA is abandoning its "anti-backsliding" requirement in this circumstance for several reasons. EPA believes that in the application of nationally promulgated effluent limitations guidelines permittees should be given equal treatment, so that companies who have made good faith efforts to comply with previously imposed permit limitations will not be penalized nor placed at a disadvantage with respect to companies operating under subsequently issued, less stringent limitations.
>
> In addition, EPA is now involved in its "second round" of NPDES permitting under the Clean Water Act (CWA). A large number of NPDES permits have expired and must be reissued. As with the first round of issuance, it is expected that some of these permits will be issued on a case-by-case basis under the authority of section 402(a)(1) because of the absence of nationally promulgated effluent limitations guidelines. If the anti-backsliding rule remains in effect it is likely that many permittees will challenge any permit limitation issued in the absence of guidelines. Thus, the proposed changes would help to avoid widespread challenges to second round permits, a situation which could force the Agency to divert resources from permit issuance proceedings to evidentiary hearings and further legal challenges. (47 Fed. Reg. 52084)

The amendment appears to be a reaction to EPA's November 1982 proposed regulations implementing the settlement agreement on the Consolidated Permit regulations. However, we believe the language is much broader than intended, and would severely disrupt EPA's and States' ability to negotiate new permits. Below, we review both the Agency's proposal and the likely consequences of the Senate language.

On its face, the proposed amendment would prevent any increase in the allowable daily discharge limitations in NPDES permits, regardless of the justification for such increase. It

would also prevent changes in any other permit conditions (such as monitoring and reporting requirements, or limitations on bypasses) which would be considered "less stringent."

However, there are many legitimate reasons, recognized in federal and state NPDES permitting regulations, for changes in permit limitations. The best examples of the type of changed circumstances which might justify increased permit limitations involve increased production or changes in -- or the addition of -- manufacturing processes. Due to the specific language of Section 13, permittees could not increase their production or change their processes unless they could do so without exceeding existing permit limitations. Other examples of appropriate reasons for modifying permit limitations include: (1) mistakes in setting original limitations; (2) changes in the level of pollutants in intake waters; or (3) changes justified by improved water quality modeling or monitoring.

The language of Section 13 could also discourage the future imposition of case-by-case effluent limitations in permits. Permit writers may delay issuing renewed permits rather than issue a permit with case-by-case BAT limitations, since such limitations would then be permanently fixed in the permit even if they later proved to be unreasonable. Permittees would tend to resist and delay case-by-case permits as long as possible, to avoid accepting limitations more stringent than those that the guidelines might later require of their competitors.

If technology-based permit limitations, once established, could never be relaxed, companies that moved first to receive their NPDES permits and commence the required treatment, prior to the issuance of national guidelines, would be at a disadvantage in comparison to plants which have delayed this permit process and installation of necessary controls. In such cases, the installation and operation of more extensive treatment than required by the national guidelines -- even where such treatment is not needed to protect water quality standards -- could be both unfair and unnecessary.

Similarly, there may be instances of prior inaccuracies in establishing effluent limitations necessary to meet water quality standards, or where improvements in water quality have occurred due to improved treatment by others or control of nonpoint sources. In these cases it may not be reasonable to categorically refuse to relax stringent treatment requirements which were previously necessitated by water quality problems. Clearly, in such cases, permit writers should be afforded some measure of flexibility to respond to local conditions.

Particularly problematic is the prohibition on any changes to "other permit conditions." The term "conditions" is normally used to refer to all legal requirements contained in the permit. It encompasses such things as testing protocols, discharge monitoring, notification requirements, compliance schedules, or upset and bypass provisions. There is certainly no justification for permanently fixing each such condition as it reads in the existing permit.

Enactment of this provision could discourage states from exercising their authority under Section 510 to impose conditions more stringent than those required by federal law. For example, many states are now requiring frequent testing for numerous toxic pollutants to provide a data base for possible future regulation. If such permit conditions could not subsequently be made less stringent, states may be less willing to suggest that such provisions be included in permits.

In summary, Section 13 of S. 431, while originally designed to accomplish a relatively simple purpose, raises a multitude of complicated permit policy issues. We believe that most, if not all, of these issues can be more efficiently resolved during the ongoing review of EPA permit regulations and procedures. Should an amendment similar to Section 13 of S. 431 be offered during the upcoming mark-up sessions, API/NFPA urge that the Subcommittee reject this inflexible approach to NPDES permitting.

B. Federal Common Law, the Resolution of Interstate Disputes, and the Preservation of Other Rights

Some have proposed that Congress consider an amendment to the Clean Water Act that would again allow suits alleging water pollution damage to be brought under the federal common law of nuisance. API/NFPA would oppose such a provision.

20-955 O—84——110

By way of background, a 1981 Supreme Court decision (Milwaukee v. Illinois) held that Clean Water Act regulatory programs preempt available federal common law remedies. During Senate debates on the Municipal Waste Water Treatment Construction Grants Amendments of 1981, the Senate adopted, without discussion, an amendment to the Clean Water Act to "make it clear that the Clean Water Act and other statutes do not displace, preempt, or in any other way disturb the federal common law."

House Conferees objected to the sudden insertion of the amendment, and it was withdrawn. The Conference Report noted "that failure to include this provision is without prejudice," and agreed to "examine further in the next session the best means to accomplish this intent." (House Rept. No. 97-408; page 27)

In Milwaukee v. Illinois, the Supreme Court held that the federal common law should apply only when Congress has not "spoken to a particular issue," and recourse to the common law becomes a necessary expedient. Such a remedy is not necessary here, especially because the Milwaukee decision neither forecloses any course of action available to a plaintiff under state law, nor prohibits a state from imposing effluent restrictions more stringent than federal standards.

If such an amendment is adopted, companies who are legally operating under the conditions of their Clean Water Act waste discharge permits conceivably could be subject to a new wave of

litigation brought under the federal common law. Such a provision would allow an affected state or municipality -- and perhaps other private plaintiffs -- to sue in federal court to effectively rewrite carefully written discharge permits. The amendment would involve the courts ever more deeply in such day-to-day regulatory activities as inspections, enforcement, and standards setting. This would, in effect, undercut the entire NPDES program.

In our view, such an amendment would also subject, to further liability under the uncertain federal common law of nuisance standards, dischargers who in good faith invested significant amounts of capital to comply with the federal and state regulatory programs and their permit requirements. The procedures set forth in the Act for participation by the public in the permit issuing process already provide an adequate opportunity for the identification and weighing of the interests of third parties that may be affected by the discharge. Thus, on the basis of simple equity considerations, a proposed amendment of this nature lacks merit.

During Senate Committee deliberations on S. 431, the above, and similar, arguments were levied in opposition to a common law amendment. These arguments met with some success in that the Committee did not favorably consider an amendment to reinstate the federal common law of nuisance in Clean Water Act permit proceedings.

However, under the guise of remedying deficiencies in existing procedures for interstate review of NPDES permits, and preserving access to state common law; the Committee passed -- without significant discussion -- amendments to Sections 402, 505, and 511 of the Act. API/NFPA find these amendments extremely problemmatic for the reasons discussed below. Should similar amendments be proposed during the House deliberations, we urge their rejection by the Subcommittee.

1. Resolution of Interstate Disputes

To deal with interstate disputes, the Senate Committee proposed amendments to Sections 402(b) and (d), and Section 511 of the Clean Water Act to resolve such disputes over NPDES permits. Proposed Section 402(d)(2)(B) would require EPA to resolve disputes involving one state's objection to another state's permit. Proposed Section 402(b)(1)(F) would require reconsideration of a state-issued permit when another state provides notice that its waters are adversely affected. Proposed Section 511(e) would: (1) set forth procedures for EPA's resolution of such an interstate dispute; (2) provide EPA with authority to stop any contested discharge; and (3) provide other appropriate relief. When the dispute involves a permitted discharge, the complaining state must have exhausted available administrative relief.

The proposed amendments elaborate on procedures for permit review by other states currently found in Sections 401(a)(2) and

402(b)(5) of the Act. The stated goal of the new proposals is to make explicit in the statute, the Congressional intent that EPA must affirmatively act to resolve interstate disputes, on the record, in a fashion that is reviewable.

Currently, under Sections 401(a)(2) and 402(b)(5), a state affected by a permit being considered by an upstream state must frame its concerns around an impact on the "quality of its waters so as to violate any water quality requirement." EPA has defined this standard at 40 CFR §§122.52(d) and 122.62(d)(4) by requiring that any NPDES permit must "conform to all applicable water quality requirements under Section 401(a)(2) of CWA when the discharge affects a State other than the certifying State." Traditionally, affected states have raised concerns if an upstream state's permit would affect their water quality standards, including the antidegradation policy.

Unfortunately, the proposed amendments establish a far broader standard under which one state can dispute another's action. Proposed Section 402(d)(2)(B) would require EPA to resolve interstate disputes by determining "whether any violation of a water quality standard of the affected State, adverse effect on public health, <u>or other demonstrated harm to the interests of the affected State</u> will result from the issuance of such permit." (Emphasis added.) Similarly, proposed Section 511(e) would require a determination that "such pollution or contamination endangers the public health or welfare, or causes or contributes to a violation of

water quality standards <u>or other demonstrable harm.</u>" (Emphasis added.)

API/NFPA do not object to elaborating on the procedures for resolving interstate disputes, and requiring a decision from EPA. However, we have serious concerns with the increased breadth of review in dealing with such disputes.

First, the broader standard for challenging a permit will place permittees at considerably greater risk in obtaining approval for, and operating under, permits that could affect other states. The standard of "other demonstrable harm" sweeps-in concerns unrelated to water quality (i.e., the relative level of unemployment in a state affected by a new discharge compared to the state in which the discharge originated). Petitioners will likely assert that this ambiguous standard is an explicit statement of Congressional intent to broaden the scope of the inquiry when EPA must resolve interstate conflicts. Consequently, the amendment may increase the number and intractability of interstate disputes, rather than simply provide a better articulated mechanism for their resolution. Endless litigation could also result from such an ambiguous standard.

Second, the broader standard imposed by these amendments will require EPA to make an extensive series of findings in response to a petition from an impacted state. Even if EPA could successfully defend a decision using such an ambiguous standard, the breadth of the inquiry will extend significantly the time necessary

to resolve the dispute, and involve EPA and the affected permittee in a never-ending, fact-finding exercise to certify that "no demonstrable harm" has occurred.

Third, the proposal may discourage an affected state from using and upgrading its water quality standards program to assess whether the activities of an upstream state are impacting its water quality. Under the broad language of the proposal, an affected state would use the opportunity to make a broader case involving more general harm. There will be no incentive to upgrade water quality standards to quantify the impacts created by an activity in an upstream state.

2. Preservation of Other Rights

The Senate Committee also approved an amendment to Section 505 of the Act to: (1) make it clear that the Clean Water Act does not preempt existing access for private individuals to remedies through state common law actions; and (2) provide states and municipalities with a mechanism for dealing with diversity of citizenship limitations in addressing interstate disputes.

The former amendment was designed to respond to assertions that the Clean Water Act could be read to preempt state common law remedies. The latter amendment was deemed necessary to provide adequate access to federal or state courts in order to adjudicate interstate disputes, where Clean Water Act remedies are not adequate to the task.

API/NFPA do not object to the stated intentions of the proposed amendment to Section 505. We do not oppose an amendment which would more clearly provide that existing state common law rights and liabilities are preserved. Nor do API/NFPA oppose the proposal to preserve liabilities under other Federal statutes for damages caused by noncompliance with any requirement of the Clean Water Act.

However, the language of the Senate amendment appears to: (1) create a new Federal right of action (with jurisdiction in Federal or State courts) for injuries caused by any "act or activity within the field covered by" the Clean Water Act; and (2) authorize appropriate relief under the applicable State statutory or common law. Thus, though intended to simply "preserve" existing rights, this provision could, if read improperly, establish -- for the first time under the Clean Water Act -- a new Federal right of action for damages caused by such activities as point source discharges, nonpoint source runoff, and accidental spills. To the extent provided under the applicable State statutory or common law, Federal (as well as State) courts would have the power to award damages and order abatement actions, beyond the requirements of the Clean Water Act.

This provision could place in the hands of Federal courts -- which would apply State statutory and common law -- substantial power to "second guess" and override: (1) the standards articulated by Congress in the Clean Water Act; and (2) the specific limitations

and conditions contained in permits developed by the expert administrative agencies with which Congress entrusted this responsibility. We have seen no evidence to indicate that access to existing remedies in state courts under state law is inadequate.

VII. CONCLUSION

In conclusion, we reaffirm our support for the 1972 Federal Water Pollution Control Act and the water pollution control programs that have resulted since its passage. We believe that the 1972 Act and its 1977 amendments provide the proper basis for additional water quality improvement as we move into the decade of the 1980's. At the same time, we agree with the Administration that modest refinements to a number of Clean Water Act programs will enhance, rather than inhibit, this desirable goal.

We look forward to working closely with the Subcommittee to craft modest changes to the Act. We thank the Subcommittee for the opporcunity to testify today. We would be pleased to respond to questions.

Appendix A

REDUNDANT TREATMENT OF COMPATIBLE POLLUTANTS
CASE STUDY
MEMPHIS, TENNESSEE

In the fall of 1978, the EPA Regional Office in Atlanta initiated action through the Department of Justice against Memphis, Tennessee for violation of the discharge permit for its wastewater treatment facilities. The violation was accompanied by allegations that the city had not made sufficient progress toward meeting the permit limitations. The city had constructed the facilities in question with a pre-1972 federal grant.

The EPA suggested to Memphis that the load of compatible pollutants to the treatment plant from Memphis industries should be reduced so that the plant could meet its limitation. In a subsequent federal court hearing, EPA stated that it would be reasonable for the industries using the Memphis treatment system to be required to reduce the BOD concentrations in their wastewaters to at least a concentration of 250 mg/l.

The city responded to this pressure by influencing the industrial users of Memphis' South Treatment Plant to hire a consultant to study how they could individually or collectively treat their wastewaters to achieve the industrial pretreatment limitations suggested by EPA, and perceived as being necessary. The study concluded that the most economical solution was to increase the capacity of the city's treatment plant.

The city was subsequently prosecuted, and a fine imposed, even though the facility had been constructed with a federal grant. This grant was prior to the enactment of the 1972 law and its requirement universally imposing secondary treatment for municipal systems. The city had constructed the treatment plant with the greatest capacity possible within the limits of the funds available. Memphis then tried to stretch the funds to meet secondary treatment limitations. (At a later date, EPA and the state agreed that Memphis was eligible for additional grants aimed at meeting the 1972 Act's goals.)

The eventual solution to the problem was largely achieved through applying various public and private technicians experienced in plant operationsl problems to the task of correcting equipment problems in new plants in order to provide increased plant capacity. In the end, the imposition of a concentration limit for compatible pollutants was found to be unnecessary, and the city has been successful in meeting its permit.

Obviously correcting operating problems was a much fairer and more economical approach than forcing some long-term customers to pretreat. However, EPA's advocacy almost forced industrial users of the Memphis system to have to pretreat for compatible pollutants.

CASE STUDY A -- PLYMOUTH, NORTH CAROLINA

In the mid-1970's, Welsh Creek near Plymouth, North Carolina was one of a number of water courses which had been classified by the state for uses less than the support of fish and aquatic life. The creek originates as drainage from a swamp. At the point in question here, it is largely a backwater of the Roanoke River. Flow through the creek is often near zero. It is further characterized as being of dark color, low pH, and of elevated temperature. Under natural conditions, dissolved oxygen (DO) periodically approaches zero. Clearly, the creek is naturally incapable of supporting an aquatic community. Accordingly, the state assigned a DO criterion lower than required for aquatic life.

Nevertheless, EPA insisted that the creek be classified for the support of fish, and carry with it a commensurate DO criterion. This was reportedly based on a rationale that: (1) some water quality parameters were consistent with such a use; and (2) a variance could be sought for those parameters which were inconsistent. As a result, the state accepted the Agency recommendation. A pulp and paper mill discharging to the creek sought a variance. Recognizing the character of Welsh Creek, the state responded by lowering the dissolved oxygen requirement.

However, the variance was rejected by EPA on the basis that its criteria for granting such a variance had not been met. EPA further imposed a Federal standard calling for 5.0 mg/l DO level. The mill in question, faced with the futility of maintaining a dissolved oxygen condition which was naturally unattainable, had little recourse but to enter into a compliance agreement wherein effluent would be diverted through a 2 mile pipeline directly to the Roanoke River at a cost of eight million dollars.

CASE STUDY B -- KALAMAZOO, MICHIGAN

The Kalamazoo River in the vicinity of Kalamazoo, Michigan has a use classification directed toward protection of fish and aquatic life. Perceived to be consistent with that goal, are dissolved oxygen (DO) criteria for an average DO of 5.0 mg/l and a minimal level of 4.0 mg/l to be met at all times.

To obtain these levels, point source controls have been agressively pursued. They include the construction of an advanced treatment plant serving: (1) Kalamazoo and adjacent communities; and (2) a number of industrial dischargers. Included among the latter are several paper manufacturing facilities.

Several studies carried out in the late 1970's have brought into question whether the required dissolved oxygen criteria will be attained. A 1978 report published by the Michigan Department of Natural Resources points out that:

> "The treatment of oxygen demanding wastes discharged to the Kalamazoo River beyond conventional, stable effluent levels is not cost effective. This is because the DO deficits due to these wastes are small compared to the (algal type) respiration effects on DO. These respiration effects are primarily responsible for limiting the assimilative capacity of the Kalamazoo River."

A 1979 update of the Section 208 Areawide Waste Treatment Plan prepared by the South Central Michigan Planning Council alludes to a contributing factor of significance to the above observation:

> "The phosphorus loading (from non-point sources in sub basin 204 east of Kalamazoo) is well in excess of the levels required to promote nutrient enrichment of surface waters."

Sub basin 204 is a "rural" sub basin. Ninety-three percent of the sub basin consists of crop land, pasture, and forest.

A second factor is identified in a 1981 study on Stormwater Pollution in the City of Kalamazoo prepared under the auspices of the South Central Michigan Planning Council. The study report indicates that the load of oxygen-demanding substances associated with stormwater runoff on typical storm days alone exceeds the assimilative capacity of the Kalamazoo River. Typical storm day conditions were thought to prevail 75 days/year. The report goes on to suggest that:

> "Though days of storms will probably not be days of minimum river flows, the (stormwater) BOD5 contribution may cause significant degradation of the river quality for a period of time, perhaps below the allowed standard."
> (emphasis added)

Thus, recent information suggests the possibility that nonpoint source loads of BOD and nutrients could, by themselves, cause violations of existing water quality standards (5 ppm DO daily average, at least 4 ppm DO at all times). Additional study will be required to determine the extent to which these nonpoint sources must be controlled to assure compliance with dissolved oxygen standards. The state should be allowed the flexibility to modify the applicable water quality standards in the event that further study demonstrates that existing standards are not attainable due to nonpoint sources that cannot feasibly be controlled.

CASE STUDY C — FLORIDA INTERCOASTAL WATERWAY

Dissolved oxygen is probably the clearest example of a need for flexibility on a local scale. Virtually all investigators will agree on a need to recognize the tremendous natural variations that occur in the case of dissolved oxygen. Dispute arises only when one attempts to establish criteria. We suggest, as is implied in the American Fisheries Society's "Review of the EPA Red Book: Quality Criteria for Water" (Am. Fish. Soc., Bethesda, Maryland, 1979), that no single absolute criteria can ever succeed. Local flexibility must be available for natural local differences and biological needs.

One specific example currently exists in the northern portion of the intercoastal waterway in Florida — a situation with doubtless dozens of counterparts throughout especially the Southeastern portion of the United States. In this area of common natural low dissolved oxygen values, the state of Florida has attempted to accommodate, to a degree, the present national water quality criteria of a minimum of 5 mg/l dissolved oxygen by specifying an average value of 5, with a minimum of 4 mg/l. However, even this "bending" of the national stated minimum is not adequate to reflect truly natural conditions that have been validated as dropping into the 3 mg/l range. Presently ongoing activities by the state to consider "waste load allocations" in this area are certain to result in technically unresolvable questions when national policy forces the state agency to base its decisions on clearly erroneous base lines of water quality.

Dissolved oxygen is the first parameter that comes to mind when one considers criteria differences in water quality. This is an understandable situation in view of the length of time and effort on the study of oxygen. It is likely that, as other parameters are studied in depth, similar problems will evolve.

CASE STUDY D -- MONTICELLO, MISSISSIPPI

As part of its 1973 triennial review of water quality standards, the Mississippi Game and Fish Commission adopted, with subsequent EPA approval, a dissolved oxygen (DO) standard of not less than an average 5.0 mg/l, but allowing an average level as low as 4.0 mg/l for short periods of time during extremely low water levels (i.e. at or less than 7Q10). In April 1977, following the next triennial review, the state chose to submit its existing standard for EPA approval. Unfortunately, EPA disapproved the dissolved oxygen criteria and gave the Mississippi Air and Water Pollution Control Commission until October 1977 to promulgate an appropriate standard. EPA recommended a daily average of 5.0 mg/l and a minimum of 4.0 mg/l. In reconsidering its action, the Commission concluded that the state standard was properly derived and, in the public interest.

EPA responded in July 1978 by formally proposing a DO standard of 5.0 mg/l to be met at all times. A less restrictive criteria ultimately promulgated by the Agency in 1979 requires an average 5.0 mg/l with an instantaneous minimum of not less than 4.0 mg/l. The Agency's authority to take this action was subsequently upheld by the Courts.

At the present time, the Pearl River at Monticello, Mississippi is designated for a use supportive of fish and wildlife. The river does, in fact, support an aquatic community native to the area and would do so under dissolved oxygen conditions represented by the criteria originally submitted by the state. Thus, designating a lesser use is neither warranted nor would it be politically acceptable. Furthermore, in the late 1970's EPA would not likely have accepted a use designation less than support of fish and wildlife.

The fact remains, though, that compliance with the dissolved oxygen criteria has imposed an environmentally unwarranted burden upon a local pulp and paper industry discharger. Even under the state's proposed criteria, the Pearl River at Monticello was recognized to be water quality limited. Effluent limitations to accomodate the dissolved oxygen requirements were met at the local pulp and paper mill through a controlled discharge program. The ability of the mill to contain discharges during the low flow conditions is contingent upon an ability to maximize discharges during high flow periods. Thus an ability to comply with the EPA-imposed DO criteria has been largely a result of higher than normal flows during non critical periods — leaving ample capacity in a 220 acre impoundment to store effluent during the critical periods. Under circumstances where stream flow patterns are more normal, compliance with the water quality criteria is questionable.

Mr. McNULTY. Please proceed.

TESTIMONY OF RODNEY C. GLOVER, MANAGER, ENVIRONMENTAL TECHNOLOGY AND REGULATORY AFFAIRS, PROCTER & GAMBLE CO., ON BEHALF OF THE AMERICAN PAPER INSTITUTE, AND THE NATIONAL FOREST ASSOCIATION

Mr. GLOVER. Thank you, Mr. Chairman. I appreciate this opportunity to speak before your subcommittee for the paper and timber industries.

Our associations support the Clean Water Act, and feel that it is fundamentally sound in philosophy and in approach. Most necessary changes were incorporated in the midcourse correction, adopted by this subcommittee in 1977, and only a few modest changes are indicated today. I will submit a full statement for the record, and concentrate on the three issues of most concern to our industry.

First, pretreatment:

The forest industry supports the pretreatment approach in section 307(b) of the act. We recognize the need for pretreatment of those industrial pollutants that are not adequately treated in publicly owned treatment works, or that would interfere with the operation of a municipal system.

Unfortunately, when EPA promulgated the general pretreatment regulations in 1978, and again in 1981, we found the procedures were complex, burdensome, and often unworkable. One program area which is particularly troublesome to many involves the pretreatment of toxics. This represents a substantial problem for the POTW's. We hope that this subcommittee will find a way to simplify the system. Others will address this issue in considerable detail.

Our industry primarily discharges conventional wastes, and the major issue for us involves pretreatment of compatible pollutants.

Since 1978, EPA has encouraged inadequate or poorly operated POTW's to require industrial customers to pretreat fully compatible pollutants—such as BOD or TSS—as a substitute for correcting the problem at the POTW. This policy disregards the act's objective of encouraging joint treatment of compatible wastes; and, in turn, increases the costs to both industrial and domestic users of the POTW.

In some cases, pretreatment of compatible pollutants makes sense. For example, slug loads can disrupt POTW's, and may require pretreatment. Additionally, large intermittent or seasonal loads can be disruptive to some POTW's. However, in most cases, joint treatment of industrial and municipal wastes is the most efficient and cost-effective approach. The decision to require pretreatment for conventional pollutants should be a local decision—based on individual circumstances—not a matter prejudiced by EPA policy.

We support an amendment, similar to that included in section 7 of S. 431, emphasizing again that Congress does not intend EPA to encourage redundant treatment of compatible pollutants. We would be pleased to work with the subcommittee to further develop this approach.

Second, NPDES permit length:

A change that should be added to any legislation would be to allow NPDES permits to be issued for periods of up to 10 years. This would reduce the work load for EPA and for the States, reducing total annual permit renewals and allowing renewals to be staggered. The 10-year permit would also provide industry with greater certainty when investing in pollution control technology.

However, we have substantial problems with the 10-year permit amendment included in S. 431 as it requires a permit to be reopened every time a new regulation or standard is issued. This would force EPA to continually reopen permits, would eliminate the advantages of the 10-year permit, would produce chaos in the existing NPDES permit program, and would destroy the stability provided by the NPDES permit. We recommend that any reopener provisions be consistent with EPA's existing regulations.

Third, water quality standards:

Section 6 of H.R. 3282 requires that States maintain, as a minimum stream use, the designated use in effect on January 1, 1983, unless statutory conditions—similar to those in existing EPA regulations—are met. Section 6 would also establish two new congressional requirements. One, no reduction would be allowed in the measured water quality parameters in a stream regardless of whether or not there is an actual impact on ambient water quality or on the needs of the local aquatic community.

Two, the act would codify the EPA antidegradation policy. These changes reflect the House's concern with EPA's October 1982 proposal to revise the State water quality standards regulations.

We do not support downgrading existing streams uses, or eliminating designated uses that can be attained. We do not believe this was EPA's intent either, but we understand the controversy caused by some of the language in EPA's proposal. Valid concerns were raised during the comment period. The agency appears to be working to resolve these concerns in final regulations expected in the near future.

There are problems with some existing water quality standards that EPA will need the flexibility to address through the new regulations. Water quality standards, adopted by the States in the early and mid-1970's, were usually developed in haste, and often were based on inadequate water quality data. In addition, EPA direction on stream use designations and numerical water quality criteria was often inflexible. The resulting standards—in general, based largely on conventional, not toxic, parameters—in some cases are inappropriate or even unworkable.

Designated uses should be consistent with naturally occurring local conditions. There are, for example, some streams flowing from swamps that have never had a consistently high dissolved oxygen level.

Similarly, numerical criteria must reflect the needs of the naturally occurring aquatic community. For example, trout in Michigan require different water quality criteria than smallmouth bass in Georgia.

States must have the latitude to reflect such conditions.

EPA should be allowed the flexibility to deal with such problems as one part of a total program that provides a high level of envi-

20-955 O—84——111

ronmental protection. Failure to give EPA this flexibility will result in water quality standards that produce problems rather than results. Congress should act only after EPA has had the opportunity to analyze the comments on the October 29 proposal and to make necessary changes.

Beyond these three concerns, we are pleased to see that H.R. 3282 would extend the deadlines for compliance with BAT and BCT effluent guidelines. We are also happy to note that H.R. 3282 does not include a Federal common law amendment.

In conclusion, we reaffirm our continued support for the goal of improving the quality of our Nation's waters. At the same time, we believe that some modest changes to the Clean Water Act are in order.

Thank you for this opportunity to testify. I will respond to questions.

Mr. McNulty. Thank you, Mr. Glover. Your longer statement has been made part of the record together with the oral statement this morning.

You heard the bell signaling a call to the House.

Mr. Glover. Yes, sir.

Mr. McNulty. I suspect you know more about the bells than I do, but we will have to recess to go vote.

Mr. Glover, would it be an imposition on you to stay here until we return?

Mr. Glover. No, sir, not at all.

Mr. McNulty. Thank you very much for your courtesy in that respect, and we will recess for 15 minutes.

Mr. Glover. Thank you, Mr. Chairman.

[Recess.]

Mr. McNulty. The hearing will come to order.

We recessed after having completed your testimony, Mr. Glover, and I will yield for questions from the gentleman from Minnesota.

Mr. Stangeland. Thank you, Mr. Chairman.

Mr. Glover, you raise a concern about past EPA policy to encourage pretreatment of compatible pollutants as an alternative to adequate municipal treatment. How would you have us fashion an amendment to address this concern without making the POTW's vulnerable to sludge loads or interference problems?

Mr. Glover. Congressman, I think the language in S. 431, which is very similar to language we have worked with before, does take care of this problem. Three points really to make. One, the language does not in any way proscribe any of EPA's options in writing general pretreatment guidelines to deal with slug load and interference. Second, it doesn't in any way affect the POTW's options in dealing with their customers.

And perhaps most important, it does not give the POTW any out from their permit. In essence, all it says is if there is a problem which is essentially the fault of the POTW rather than the customer, the EPA shall not interfere in the relationship between the customer and the POTW. It only deals with the issue when the problem is that of the POTW and not caused by the customer.

Mr. Stangeland. With regard to the reopening provisions accompanying a 10-year permit, would you prefer the present 5-year

term to a 10-year term with a mandatory new permit each time there is a new publication?

Mr. GLOVER. As we testified, we would have much hope that the House could craft the bill so the reopeners would not provide the problems they do in the Senate bill, for example. But if we had to choose between the precise language of the Senate bill and the current 5-year permit program, there is no question in our industry we would much prefer a certain 5-year permit to the continual reopeners of the so-called 10-year permit.

Mr. STANGELAND. In your testimony you state that you do not support downgrading. I am wondering if you, in light of some testimony we had yesterday, and I would just set the scenario for you and see if you would change your attitude somewhat, if the Federal EPA sets a water quality standard for a stream segment and then the State comes along and has the option of setting a higher standard, and does, and sets a substantially higher standard, the discharger finds that he can't meet the State standard but has far exceeded the Federal standard, then could you support the lessening of the standard on the State level, still substantially higher than a Federal standard?

Let me add another point. The State after extensive hearings is willing to lower its standard that it set.

Mr. GLOVER. As I understand your question, this would be a standard that was upgraded to a level that could not be attained with the situation on the stream, as opposed to the existing use designations, which we are referring to. Basically, if the standard is being attained, no matter who has set it, we don't feel that that standard should be downgraded. If that standard can be attained by the use of the technology prescribed in the act, we don't feel that the standard should be changed, the State should force the issue that it be attained.

However, if it is a standard that simply cannot be attained, for example, we have some situations which we have submitted with our testimony where the standard could not be attained if the plants ceased to exist, then certainly we think the designation should be changed.

Mr. STANGELAND. We would like some of those kinds of examples. But I guess the concern is that the Federal has a standard, and it sets a standard for a stream segment. The State have the option to set a similar or higher standard, equal to or higher. So the State opts to set it substantially higher and the discharger goes way beyond what the Federal standard is but can't reach the State standard. Then he appeals to the State. The State is willing to bring its standard down to what has been attained, and is attainable. But then the Federal rules and regulations supposedly prohibit that. We call that downgrading.

Downgrading has a bad connotation. I wish we could find a better term.

Mr. GLOVER. That is really a very complex question, and it basically illustrates the need to give the States some flexibility. For example, if as has happened, the State in error set a standard of dissolved oxygen of seven in a Southern State where smallmouth bass were the basic fish present, and they required, depending on the species, anywhere from three to five, then obviously it would be a

mistake to retain a standard of seven or eight which does not apply to a warm water fishery.

In that case, yes, we think the numerical criteria should be changed. But we would emphasize that the use designation, the achievement of the real water quality would not be changed because the total needs of the local aquatic community would still be served. So yes, sir, if the standard does not make sense in terms of local aquatic community, the numerical criteria, should be changed.

But we don't think use designations should be downgraded.

Mr. STANGELAND. Thank you. I have no further questions at this time.

Mr. MCNULTY. Mr. Smith.

Mr. ROBERT SMITH. Thank you, Mr. Chairman.

You oppose an amendment that would replace EPA review and removal of State NPDES permits with a periodic EPA audit. Would you explain how that works and how we can know protection will be provided should we adopt this amendment?

Mr. GLOVER. Yes, Congressman Smith. Essentially all we are requesting is that the degree of delegation from EPA to the States be increased. What we are suggesting is that after a State has had NPDES permitting authority for 3 years with the permits during that period being reviewed as they are today by EPA, so EPA has a clear record of the State's ability to manage its program, if the EPA finds that the State has managed that program in a competent fashion, that they then formally waive the review on a permit-by-permit basis.

Now, to make sure the State retained that level of competency they would have to periodically audit. If the State ceased to issue permits in a competent fashion, if EPA felt they weren't doing their job, they could then withdraw the waiver or permission. The advantage to EPA would be a resource one. They would require a lot less people if they didn't review every permit.

It has two advantages to industry. The first is having to deal with two agencies rather than one can extend the period to get a permit substantially. Another advantage would be in the current situation sometimes companies get whipsawed between two agencies. In many cases the issues between the agencies may not even be issues germane to the company, but they find they are caught in between.

We would much prefer to deal with a single agency, be it EPA or the State, rather than two. So it would be an advantage I think both to the permitting agencies and to the companies, sir.

Mr. ROBERT SMITH. Thank you. One other question I have. You are urging in your statement for the subcommittee to act affirmatively on a program to provide additional flexibility to POTW's in implementing pretreatment requirements. Do you have any additional information regarding that, or specific recommendations that the subcommittee might follow in trying to implement that suggestion?

Mr. GLOVER. Basically our interest in the pretreatment program revolves around compatibles. Our concern in regard to toxics is that we are afraid that the POTW's simply are not capable of administering the program. This is not because of the ability of their

people, but they just don't have the resources to handle a program that is going to be a very complex permitting program. We are afraid this will cause chaos in the POTW's.

Even though our concern is compatibles, we are afraid it will reflect on the ability of the POTW's to handle our discharges. Basically there are a number of alternatives to take this load off the POTW's. They are certainly not set up to handle an NPDES permit program, for example. One would be the waiver provision. Another would be the transfer, the requirement for issuing categorical permits from the POTW's to the States who have personnel to handle it.

In this type option the State or local POTW would simply meet its permit and the requirements of the general pretreatment guidelines. The State permitting authority would hand out the categorical permits to indirect dischargers the same as they do now to direct dischargers. That obviously would increase their workload. That could be reduced substantially if specific provisions were added to the law to allow general permits for certain classifications to allow a system whereby permits for removal allowances would be based on removal of BOD which in fact would be a surrogate for the toxic.

So if you knew what the removal for the POTW was, you could go to a chart.

Mr. ROBERT SMITH. Would you mind submitting those recommendations in writing?

Mr. GLOVER. Certainly, sir.

[The information received from Mr. Glover follows:]

PRETREATMENT PROPOSAL

There are three basic major flaws in the pretreatment scheme envisioned in the current law.

The categorical program is to be implemented by POTW's. By and large POTW's do not have the resources to implement what essentially is a complicated NPDES permit program. These resources reside in the state agencies.

The POTW's are being required to scrap existing local pretreatment programs designed to meet local needs and substitute what in many ways is a uniform national program. The potential results are the high cost or replacing often staisfactory programs with new ones, and the local problems created by imposing a national program which does not meet local needs.

The complicated removal credit system is almost impossible for state or local authorities to implement, and this will mean costly wasteful redundant treatment.

With a few relatively simple changes, the existing categorical system can be made to work, without any of the problems noted above.

The categorical program would be totally divorced from the POTW pretreatment program and implemented by the state in the same manner as the NPDES program. Each categorical discharger to POTW could apply to the state for a discharge permit. The permit would be issued by the state and compliance reports would be made to the state. There would be no involvement by the POTW. (The POTW could require lower effluent limits [i.e., higher removal] if necessary to conform to needs for its local pretreatment program.)

Each POTW would implement a pretreatment program of its own, designed to meet its need and its NPDES permit. the EPA or state environmental agency would not be involved with the local program unless the POTW failed to meet its permit, and the administrator would be directed to defer to local pretreatment programs unless an inadequate program was the cause for a failure of the POTW to comply with its permit terms. (Since the categorical program would be a separate state-implemented program, there normally would be no need to intervene in local programs.)

The complexity of the removal credit program still would need to be addressed to keep the workload of permitting authorities within reasonable boundary and to avoid redundant treatment.

This would be accomplished by eliminating the very complex system of POTW by POTW, facility by facility, standards, which requires difficult analytical tests. Instead EPA would issue removal allowances on a national basis along with the categorical guidelines. This approach would use surrogate pollutants to set the degree of removal allowance to be granted. The allowance would not be a "go-no go" test, but rather a sliding side or percentage removal allowance based on the annual percent removal of BOD (for toxics removed by secondary treatment), or on the annual percentage removal of settleable solids (for toxics removed by primary treatment). While surrogates generally are not sufficiently accurate to determine effluent concentrations, and thus cannot be used to set permit limits, they should be accurate enough to determine percent removal on an annual basis, and to set removal allowances. (This difference in the suitability of surrogates is in large part due to the fact that effluent limits are based on what is "left," where a small absolute error results in a large percentage error, while a removal allowance is based on what is removed, where a small absolute error is a small percent error. There also is generally a better statistical base with multiple users.) By using percent annual removal for POTW's, events such as normal by-passes would be factored in to the allowance.

Each POTW would certify its annual percvent removal of BOD and settleable solids using guidelines developed by EPA. Each categorical discharger would request a permit from the state permitting authority. The state would determine (1) the degree of removal required by the categorical standards, and (2) a removal allowance based on the combination of the certified POTW performance and the national removal allowance curve provided by EPA. The two would be combined to determine removal requirements for the specific categorical discharger.

This proposal should not only solve the problems, but also be politically acceptable, as it meets the legitimate needs of virtually all interested parties.

POT's and local authorities.—The local authority, who truly are unable to cope with the current program, would only have to run a reasonable and normal local pretreatment program and meet their permits. They should be delighted.

State authorities.—They will have the added burden of categorical discharge permits. However, given the simplification in the program resulting from national (percentage) removal allowances proposed above, this should be less additional work by far than that required for approval of pretreatment programs, and for approval of case-by-case removal allowances, required under present regulation.

EPA.—EPA will have the added burden of determining sliding scale removal allowances. This burden can be simplified if the law grants the administrator considerable discretion in the degree of scientific analysis required to set the scales, and allows such removal scales, where appropriate, to be determined for families and categories of pollutants rather than for every individual pollutant. Regardless of whether or not this simplification is authorized, the work for EPA should be considerably less than implementing the current program or any of the "opt-out" alternatives.

Environmentalists.—The environmental groups also should be pleased. "Opt-out" which allows some toxic polluters to escape any controls will be "dead." Categorical standards will be administered by the States, and the "sweet-heart deals" with local authorities which some environmental groups have feared will be impossible. The control scheme is totally technology driven and no water quality based waivers are involved. Redundant treatment will be eliminated, but the environmental groups have claimed they do not favor redundant treatment. Perhaps most important, it is a program which can be put into place quickly and with general support; the current law and regulations will continue in widespread disfavor, and many of its impractical requirements will result in confusion and continued delay in implementing an effective program. This helps no one. This approach should result in a significant net gain for the environment.

Industry.—Those industries who had hoped to escape controls entirely under an opt-out provision, or under water quality base [BAT] waivers may not be pleased. Industries whose pretreatment costs are essentially related to the degree of removal required will be helped the most; those whose costs are essentially incurred when any degree of pretreatment is required will be helped the least. However, responsible industry which accepts the basic philosophy of the '77 act should be pleased: Redundant treatment is eliminated.

Mr. ROBERT SMITH. Thank you, Mr. Chairman.

Mr. MCNULTY. Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman.

In your testimony you indicated that section 10 of H.R. 3282 would produce, if enacted, ill-founded results and changes in the 404 program. What consequences do you foresee that such enactment would have of section 10 to the 404 program and its implementation? And also what effect would it have upon your industry?

Mr. GLOVER. Our basic concern there, Congressman, is that these changes would codify existing standards, would lead to inflexibility in the program, and possibly litigation.

We are afraid that if the standards were codified as opposed to simply being in the regulations it would lead to increased litigation.

In addition, the section 10 would codify the provisions for interagency review. We think there is some flexibility that needs to be left in that, so that the agencies can adapt to changing conditions. Again we are afraid by freezing them we would produce situations where the time to get legitimate permits was simply—that is basically my concern.

Mr. PACKARD. Thank you. I have no further questions.

Mr. MCNULTY. Thank you. Do members of staff have any questions?

Mr. Glover, thank you for taking time out of a busy life to come and testify this morning. We are grateful to you.

Mr. GLOVER. Thank you, sir. It has been my privilege.

Mr. MCNULTY. The agenda next lists Jerrel Smith, manager of Union Electric Institute, and John Gibson.

Are you gentlemen here? Good.

Mr. Smith, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

EDISON ELECTRIC INSTITUTE: WRITTEN TESTIMONY ON CLEAN WATER ACT REVISIONS

INTRODUCTION

As EEI indicated in testimony before this Subcommittee in July, 1982, the electric utility industry believes the Clean Water Act can be improved significantly. At that time, EEI applauded the moderate and, on the whole, sensible set of proposals for amendments to the Clean Water Act forwarded by the Administration to Congress. Much has changed since then, however. The Administration now has no legislative proposals pending before this Subcommittee. Rather, the Subcommittee is focusing primarily on H.R. 3282, introduced by Representative Howard.

EEI believes that this bill does not improve the Clean Water Act's regulatory framework. Further, it does not adopt the thermal variance provisions suggested by the Administration in its 1982 legislative proposals. This testimony focuses on the changes that are needed in House Bill 3282's provisions concerning water quality standards and criteria, and concerning substantive and procedural requirements for obtaining dredge and fill permits under § 404.

EEI's testimony also discusses two amendments which EEI believes should be included in any reauthorization bill—(1) streamlined thermal variance mechanisms and (2) ten year permits. Additionally, it discusses the anti-backsliding, criminal sanctions and preservation of rights provisions which are being considered by the Senate, and which EEI strongly opposes.

HOUSE BILL 3282—THE WATER QUALITY STANDARDS AMENDMENTS

The water quality standards provisions of House bill 3282 make changes in three main areas: toxics control, antidegradation, and use upgrading and downgrading. EEI believes that these amendments are unnecessary, because current EPA rules already cover these matters effectively. Enacting H.R. 3283 would serve only to dis-

rupt and delay effective, ongoing EPA and state regulation under the existing statutory provisions and EPA regulations.

A. Controls for "toxics hot spots"

Section 7 would bypass the entire state-based system for water quality regulation for which Congress has provided in the Act. It would require *EPA* to develop "individual control strategies" involving limitations "beyond BAT" for waters which *the Agency* determines will not meet, in timely fashion, applicable state water quality standards to achieve "fishable/swimmable" water quality, due to point source discharges of toxic pollutants. In effect, the provision scraps the present water quality regulatory program as to toxics. It places virtually sole responsibility for regulating toxics to meet *state* water quality standards in *federal* hands, with little, if any, role for the states.

EEI strongly opposes this provision for three reasons. First, the provision is inconsistent with both the substance and structure of the existing Act, which places primary responsibility on state regulators, not EPA, for setting, implementing and enforcing compliance with state water quality standards. Second, the provision is unnecessary, because EPA already has adequate authority under the Clean Water Act to ensure that states comply with the duty that Congress imposed upon them under the Act to implement water quality standards by imposing limitations necessary to achieve those standards.

Both of these reasons are illustrated in the structure of the Act's current provisions. Section 303 of the Act requires states to develop water quality criteria sufficient to attain designated uses. EPA is required to review proposed state standards and to ensure that they are consistent with the requirements of the Act. Further, the Act mandates achievement of limitations necessary to implement applicable water quality standards. These reguirements apply to toxics, just as they do to conventional pollutants, and they are now being implemented by the states for toxic pollutants. Clearly, then, the Act already provides adequate mechanisms for controlling toxic discharges. These mechanisms are to be implemented by *states*, subject to EPA review and oversight. The new layer of EPA based regulation proposed in § 7 of H.R. 3282 would be duplicative and disruptive.

Third, § 7(a) is unworkable. EPA simply does not have the manpower and money to itself regulate every individual toxic discharged under § 7(a) in each of the 50 states, particularly not within the stringent time periods set out in § 7(a).

In sum, the § 7(a) provisions are unneeded and unwise and should be deleted from H.R. 3282.

B. Antidegradation

H.R. 3282 also contains, in § 6(b), a provision narrowly restricting the circumstances under which new pollutant discharges, or "degradation," may be allowed. This provision—apparently designed to codify EPA's present rules—was inserted in response to EPA's proposals to revise those rules. As you are no doubt aware, the Administration is now reworking its regulatory proposals on antidegradation (as well as on use downgrading and upgrading, as discussed below). EEI believes the antidegradation provisions cut irrationally across established technology and water quality management provisions of the Act, and thus are bad public policy. EPA is making efforts to deal with these issues in a reasonable fashion by regulatory means, within the existing structure of the Act. Whatever may be the outcome of that regulatory process, EEI believes that it is fundamentally unwise to codify—and thus freeze in statutory language—detailed aspects of the water quality program such as these. Even if Congress feels it necessary to codify EPA's current antidegradation rules in the statute, however, § 6(b) does not do so. It goes *far beyond* EPA's current regulations. For example, it omits the crucial language in EPA's rules requiring that antidegradation policy and implementation conform to § 316(a) of the Act, thus risking nullification of the Act's important thermal variance provision.

Section 6(b) also goes beyond EPA's current rules by prohibiting new or increased pollutant discharges unless (1) such discharges are necessary to accommodate "essential," (as opposed to the rules' "justifiable,") economic and social developments, and (2) there is "no feasible alternative" to the development. While EEI believes new power plant construction should clearly qualify under the "essential" test, and will frequently do so under the "no feasible alternative" test, these are nevertheless unduly restrictive, burdensome tests. Read broadly, they could impose review requirements analogous to those under NEPA upon the state NPDES permit licensing process, thus interjecting additional delay and expense into an already burdensome process.

The antidegradation provision is further flawed in that it would require states which choose to allow new pollutant discharges to "take all practicable steps to minimize the effects of development on water quality." Again, if read broadly, this provision could require permittees to offset new discharges by instituting control measures on other sources, where practicable. Thus, it may introduce into the Clean Water Act all the complexities of "offset" requirements similar to those under the "non-attainment area" program of the Clean Air Act.

For these reasons, EEI believes that the antidegradation provisions ought to be deleted entirely or, at the very minimum, conformed to EPA's current regulations.

C. Use downgrading and upgrading

Section 6 of the bill would essentially codify EPA's regulations on use downgrading and upgrading. This is both unnecessary and counterproductive. As noted above, the Agency is working to resolve these issues by regulatory means. There is no reason to believe that its efforts will not produce reasonable, adequately protective regulations which implement the goals and directives of the Act. Indeed, that is the purpose of the administrative system, whereby the Agency proposes regulations and solicits responses from members of the public and other agencies. This process should not be circumvented.

More importantly, it would be unwise to engrave in stone any particular set of detailed requirements or prohibitions on use downgrading or upgrading. Such an approach deprives EPA of the flexibility needed to accommodate changing circumstances.

THE 404 AMENDMENTS

Turning to § 404, we believe that there is no demonstrated need for the wholesale and fundamental statutory changes proposed in § 10 of H.R. 3282, that those changes are unwise, and that the statutory language should be left flexible so that it can accommodate the continued regulatory development that experience with the complex § 404 program will dictate.

First, § 10(a) of the bill would enshrine in statutory language a narrow, single-factor standard ("unacceptable adverse effect on the aquatic environment") which deprives the Corps and EPA of needed flexibility in permit issuance. Second, § 10(a) would require an evaluation of all practicable alternatives in every case. Thus, even where the proposed construction would not constitute a "major federal action," this statutory language would still require NEPA-like review of all alternatives, with all its attendant delays.

Third, § 10(a)'s "least damaging practicable alternative" requirement imposes a quixotic pursuit of environmental purity without sufficient regard for cost. The definition of practicability, which is apparently derived from the EPA Guidelines, purports to take economics into account. However, if those guidelines are any indication of how this section will be interpreted, cost-benefit analysis will not be incorporated into the identification or analysis of alternatives, and an alternative can only be excluded from consideration if it can be shown to result in unreasonable or excessive costs. Thus, under this standard, a power plant could be forced to follow a slightly less damaging environmental alternative at a substantial increase in cost, even though a discharge at the proposed site would not result in any significant degradation of waters of the United States. If, in addition to these express standards, the amendment or its legislative history incorporates the EPA Guidelines' "water dependency" test and its current presumptions, the construction of new power plants could become quite problematical. At best, overcoming those presumptions could be time-consuming; at worst, the presumptions could mandate construction at a far less economic location.

In sum, § 10(a) will codify an excessively stringent standard, it will delay power plant construction by instituting a NEPA-like evaluation of alternatives, and it could dictate the siting of new power plants without adequate consideration of economic factors with the obvious result of substantial increases in the cost to ratepayers for only a marginal or speculative improvement in the environment.

Section 10(b) concentrates on procedures, rather than standards, but its modifications would have a similarly grave effect on power plants. Section 10(b) substantially modifies the procedures applicable to individual permits by conferring on EPA, the Department of Interior, and the Department of Commerce the right to appeal a district engineer's decision to issue a permit. Such a right of appeal, if exercised, automatically delays permit issuance by at least 60 days and requires both the district engineer and the Secretary of the Army to justify the denial of an appeal in writing. This amendment undermines the regulatory relief provided in the Corps

regulations at 33 C.F.R. § 325.2(d)(4), whereby the Corps can ignore untimely comments from these federal agencies.

More importantly, the creation of specific rights of appeal for these agencies reverses the Congressional commitment to the shortening of time for permit processing, as evidenced by the current § 404(q), and gives federal agencies with no specific statutory authority over § 404 permits the means to delay the construction of power plants and, ultimately, to require unnecessary and statutorily unfounded mitigation measures. There is no reason to believe, based on experience in the field, that the present, delicate balance of agency interests should be so decisively altered.

IMPROVED THERMAL VARIANCE PROVISION

EEI believes that, at a minimum, any House bill should contain revisions to the thermal variance provisions of § 316. As EEI stated in July, 1982, a revised thermal variance provision which streamlines the standards and procedures for obtaining thermal discharge variances is urgently needed. Once again, EEI would like to endorse the Administration's 1982 proposal to amend § 316(a).

When the Federal Water Pollution Control Act was first passed, Congress was concerned about the environmental effect of discharging heated water from steam-electric power stations. It classified heat as a "pollutant" and required NPDES permits for its discharge.

The standard off-stream system required to remove heat from cooling water is the evaporative cooling tower. Cooling towers have three negative characteristics. First, they are very expensive, costing between 30 and 75 million dollars—including burning of an additional 50,000 tons of coal each year—for a single 1000 MW generating unit. Second, they evaporate large quantities of water to dissipate heat to the atmosphere, consuming up to 250 percent more water than open-cycle cooling. This is particularly important in the more arid parts of the nation. Third, they may sometimes cause more adverse side effects than they prevent. These effects potentially include ground level fogging, icing of nearby exposed surfaces in winter, cloud formation, salt drift from plants using ocean cooling water, and aesthetic impact. Though cooling towers may be acceptable in some circumstances, these three negative traits make them an unattractive alternative where some form of onstream cooling can be used.

Heat is not like other pollutants. Heat can alter the aquatic habitat (sometimes in beneficial ways), but it dissipates rapidly to the atmosphere. It is not a toxic substance, and does not react chemically with substances, plants, or animals. Recognizing the unique nature of heat, and that costly cooling towers should not be required where they are not needed, Congress provided from the outset in the Act for thermal variances based upon biological studies.

Ten years of intensive scientific investigations in the course of such studies now show that the environmental effects from discharges of heated water are minimal or nonexistent and therefore thermal variances for existing sources are usually granted. But utility managers are not likely to seek variances for new plants, since cooling system design must be decided very early in a plant's construction schedule. Even when managements believe there will be no significant environmental harm from thermal discharges, they may be unable to delay constructon long enough to conduct the detailed biological studies required by § 316(a), to pursue a variance through the labyrinth of administrative procedures at both state and federal levels, and to obtain a decision under the uncertain and subjective test provided in the Act.

In short, it is now documented that discharges of heated water simply are not the critical environmental problem feared ten years ago. Yet heat is still classified as a pollutant in the Act. Expensive cooling towers are still presumptively required, frequently to the exclusion of other more sensible heat dispersion techniques like diffuser pipes, cooling ponds and lakes, and careful siting of new open-cycle plants. Millions must still be spent on complex, individual biological proofs that almost always reach the conclusion of no significant harm to the aquatic environment.

Full-length biological "demonstrations" should be required for a variance only when there is reason to believe that a thermal discharge might cause significant environmental harm. Thermal discharges are not likely to cause significant environmental harm if they comply with water quality standards. Thermal water quality standards to protect fish and wildlife were set under EPA supervision, and must be reviewed by the states at least every three years. These standards are a convenient, simple, relatively objective basis for determining whether thermal discharges should be permitted. The Act should, as EEI has argued, be amended to allow thermal variances when a state's thermal water quality standards are satisfied.

When such standards would be exceeded, and there may then be more question whether environmental harm might occur, permittees who wish to perform biological studies should be allowed to do so to obtain a variance. They should not, however, have to show the continued presence of exactly the same "indigenous" population of aquatic organisms as would have resided in the area in the absence of a thermal discharge. Rather, a satisfactory demonstration should be based on maintenance of a "balanced population." Some species will avoid, and others will be attracted, to the warmer water. These subtle, non-persistent species shifts are not the sort of significant adverse environmental impact that should automatically require the expenditure of society's limited resources on expensive, multi-million dollar cooling towers.

Congress now has the information it needs to streamline thermal decisionmaking. It can—and should—provide a much more efficient procedure for deciding whether various types of control technology—particularly cooling towers—should be required. We urge you to incorporate the Administration's § 316(a) proposal in any reauthorization legislation.

TEN YEAR PERMITS

EEI also believes that any reauthorization bill should include a provision extending the NPDES permit term under § 402 from five years to ten. the Clean Water Act has now been in effect for ten years. The five-year NPDES permits issued in the first round of permitting are now expiring, and a second round of permits is being issued. First-round permits required sources to meet effluent limitations based on the "best practicable" control technology, and generally more-stringent BAT requirements will be imposed in second-round permits. There are roughly 50,000 NPDES permits outstanding. Preparing applications for processing a single permit can take years and tens of thousands of dollars.

Both regulators and regulated industry need greater finality and certainty. After second-round permits impose BAT and BCT requirements, no further stages of technology-based limitations will remain. The time has come to extend the permit term to at least ten years, as the House Subcommittee on Oversight and Review has recommended. This would save everyone a great deal of time and resources. As the House Oversight Subcommittee said: "Extending [the permit term] to 8 or 10 years would allow a more effective utilization of the overburdened regulatory staffs of the EPA and the States." [1]

Some have argued that extending permit terms to ten years amounts to "no further progress for a decade." This argument is simply not true. EPA already had authority under § 402(b)(1)(C) of the Act to modify permits "for cause including, but not limited to, . . . change in any condition that requires a temporary or permanent reduction of elimination of the permitted discharge." EPA currently uses "reopener clauses," in certain cases, to provide for future incorporation of more stringent technology-based limitations. Existing permits currently may also be revised whenever new information indicates different permit conditions should have been imposed.

Thus, EPA has sufficient discretion to require permit reopening where it is appropriate. The provisions noted above impart adequate flexibility to ten year permits, and they eliminate any need for unwieldy and burdensome "mandatory reopeners" such as those required by the Senate in its ten year permit provision. In practice, such a requirement would impose unnecessary administrative burdens upon EPA and state regulators, negating the positive aspects of extending permit terms to ten years.

ANTI-BACKSLIDING

The far-reaching, inflexible anti-backsliding provision included in Senate bill 431 would essentially freeze *all* existing and any future NPDES conditions (not just effluent limitations) without allowing a permit issuer to consider the wisdom of needed changes as permits are reissued or renewed. It would allow only one exception—effluent limits could be adjusted where the treatment approach had been properly implemented, but the limitations nevertheless could not be achieved. EEI strongly opposes such an arbitrary, inflexible provision.

While movement toward achieving "fishable and swimmable" water quality is a salutary goal of the Act, Congress has provided a carefully tailored regulatory

[1] Report on Implementation of the Federal Water Pollution Control Act, Subcommittee on Oversight and Review of the House Committee on Public Works and Transportation, December 1980, at 62.

framework for doing so—one that deliberately balances a myriad of competing social and economic policies. This "permit freeze" provision—indeed any arbitrary anti-backsliding "ratchet" policy—cuts irrationally across the framework of the Act and regulations to prohibit any later reconsideration by the permit issuer, on any ground, of the wisdom of previous permit decision. Congress should not prevent the careful judgments needed, over time, under this Act by adopting a sweeping and unnecessary "ratchet" provision.

Such a rigid anti-backsliding provision will not produce significant environmental gains—it would merely lead to regulatory requirements which are unnecessary and are (1) unfair, (2) economically and, in some cases, environmentally counterproductive, and (3) inconsistent with the water management objectives of the Act.

Whether or not an anti-backsliding provision is in effect, any permit issued under the Clean Water Act must implement the Act's technology-based and water quality-based regulatory provisions, and in so doing, it will ensure, as Congress has provided, that all environmental gains that are warranted are achieved. An anti-backsliding policy can achieve no more. All a provision like that in the Senate bill can do is arbitrarily "lock in" any permit decision made under those regulatory provisions when EPA or the states later believe they should be reconsidered—no matter why that belief is held and no matter how strongly it is held. This is simply irrational and, by definition, results in needless requirements whenever invoked.

It is not difficult to see the myriad circumstances under which the Senate provision could produce unfair and inequitable results. On its face, it locks permittees into compliance with existing permit limitations and standards, even though the permitting authority has found, pursuant to a request for a variance, that those limitations are unreasonable or unnecessary (thus rendering the Acts carefully crafted variance provisions useless, in many cases); and even though new information discloses, or changed circumstances dictate, that the limitations are unreasonable or unnecessary; and perhaps even though a court of law has determinated those limitations or standards are illegal and invalid. Further, if applied to gross, rather than net pollutant limitations, the provision would unfairly bind dischargers to limitations based upon the amount of pollutants in the intake water at the time the permit was first issued, even though subsequent increases in pollutants levels in intake waters (over which dischargers may well have no control at all) make achieving such limitations uncertain or impossible.

Such a provision also would be economically and socially counterproductive. For instance, as EPA's existing permit modification provisions recognize, increases in production or flow must be allowed in many cases where mass limits are used. Otherwise, increases in production or flow will be impossible for the many industries with production-based or flow-based mass limits, even though the treatment technology is operated at the same removal efficiency. Thus, locking existing facilities into present mass limitations would also lock in existing rates of production, preventing industrial growth and development. Additionally, dischargers would be forced to spend limited resources to comply with overly stringent or unnecessary requirements, rather than concentrating resources upon more critical requirements. This is both wasteful and socially counterproductive.

Anti-backsliding requirements also may prove environmentally counterproductive. This is especially true for utilities, for example, if anti-backsliding rules alone force them to build expensive cooling towers notwithstanding § 316's thermal variance provisions. As EEI's previous testimony has indicated, the adverse effects of cooling towers are myriad, and often outweight any water quality gains achieved.

In addition, if such requirements were applied to water quality-based limitations, states effectively would be prevented from engaging in the careful, dynamic water quality planning and management Congress has required in § 303 of the Act. Reallocation of stream-loading allowances, for example, would be arbitrarily constrained. Further, facilities on pollutant-limited stream segments which are subsequently cleaned up would be unable to add additional capacity, because they would exceed their water quality-based permit limitations (which would then be based upon waste load allocations that are no longer necessary).

CRIMINAL SANCTIONS

The proposed amendment to § 309(c) is Senate bill 431 adopts wholesale the revisions EPA advocated in 1982. The amendment would double the penalties for first time offenses done "knowingly", and would make all such violations felonies.

According to EPA, its proposal was "intended to address intentional violations of the Act occuring on a regular basis over an extended period of time that result in significant harm to the public health or the environment . . . ." EPA said the lan-

guage was "not directed or intended to apply to isolated incidences of either unpermitted discharges or discharges exceeding permit limitations." Yet nothing in the proposed amendment would limit its application to intentional, repeated, harmful violations.

Under this "knowingly" proposal, the only prerequisite to imposition of what EPA has called "extraodinary punishment" for every violation is that the violator simply be aware that his act is likely to result in an unpermitted discharge of pollutants. There is no requirement that discharging pollutants be one's conscious object or desire, no requirement that the discharge harm anyone or anything, and no requirement that the discharge be repeated. This is a very broad range of conduct to expose to such "extraordinary punishment," with only "prosecutorial discretion" to detemine who goes to jail and who does not.

Although EEI believes more severe penaltie are not needed under the Clean Water Act, if Congress disagrees, it should at least carefully restrict such penalties to the egregious violations EPA intended to punish. Any "super" penalties should apply only to intentional violations (i.e., those in which it was the actor's conscious object or decision to dispose of pollutants illegally), that are repeated on a regular basis for an extended period, and that result in significant harm.

PRESERVATION OF RIGHTS AND INTERSTATE DISPUTE RESOLUTION

Proposed § 505(e)(4) in Senate Bill 431 is confusing, unnecessary and disruptive. Its first sentence merely seems to recite the obvious proposition that lawsuits can be filed in state courts under state laws. The Senate Committee Report indicates that the sentence is designed merely to support the declaration in the preceding paragraph (subsection (e)(2)) that state common law is not displaced or preempted by the Clean Water Act.[2] We believe tha such a provision is simply confusing and unnecessary.

The second sentence of proposed § 505(e)(4) is also flawed. First, the provision would seem to allow a state to sue another state in federal district court. This clearly conflicts with 28 U.S.C. § 1251, which confers upon the United States Supreme Court original and exclusive jurisdiction over all controversies between two or more states.

Second, the provisions can be read to allow states or municipalities to enforce their own state regulatory requirements directly against dischargers in other states. The Act now wisely avoids such direct conflict or regulatory jurisdiction by statutory mechanisms like §§ 401(a)(2), and 402(b)(3), (b)(5), and (d)(2)(A) (which provide for interstate dialogue and dispute resolution at the time an NPDES permit is issued) and such regulatory provisions as 40 CFR § 35.1550(c)(4) (which requires that states insure that NPDES permits implement a downstream state's water quality standards). EEI therefore believes that such a provision is ill considered and unnecessary, and should not be adopted.

The Senater bill also proposes to amend § 511 of the Act to allow EPA enforcement, at the behest of a downstream state, when pollution from an upstream state is violating the downstream state's water quality standards. This section is loosely drafted at present. At a minimum, its focus should be limited to interstate pollution causing or contributing to a violation of water quality standards, as should the similar provisions of proposed § 403(d)(2)(B). EEI believes, however, that no such change is needed at all, since the present statutory provisions protecting downstream states are sufficient.

Mr. McNULTY. Please proceed.

TESTIMONY OF JERREL D. SMITH, MANAGER, ENVIRONMENTAL SERVICES DEPARTMENT, UNION ELECTRIC CO., ST. LOUIS, MO., AND JOHN GIBSON, ATTORNEY, PACIFIC GAS & ELECTRIC; ON BEHALF OF THE EDISON ELECTRIC INSTITUTE

Mr. JERREL SMITH. Yes, sir, we are ready.

I am Jerrel Smith, manager of the Environmental Services Department of Union Electric Co. in St. Louis. With me today is Mr. John Gibson, who is an attorney with Pacific Gas and Electric, in

[2] Report of the Committee on Environment and Public Works to Accompany S. 431, at 28.

San Francisco. Mr. Gibson and I will share the comments this morning if we may.

Mr. Chairman, I intend to address basically three points as briefly as I can. I would like to talk about the thermal issue which is, of course, very important to the electric power industry. I would like to speak briefly about extending the term of the permits, and in addition make a few comments regarding antibacksliding, which I understand has been considered by the Senate.

We appeared before this committee in July of last year and spoke to you at that time about what we thought to be the needs of the industry in terms of modifying section 316(a) of the act to make it more flexible for us, particularly in terms of being able to plan and build new power facilities.

When the Clean Water Act was passed, Congress was concerned about the impact of thermal discharges on the water bodies, and rightfully so. We now have, however, 10 years of experience in operating under the Clean Water Act and a good bit of information has been developed which shows that thermal impacts on our water bodies in the country are minimal at most.

Mr. McNULTY. Mr. Smith, are you speaking extemporaneously or from a statement?

Mr. JERREL SMITH. Extemporaneously, yes, sir.

Mr. McNULTY. Thank you.

Mr. JERREL SMITH. We are interested once again in encouraging you to consider introducing language into section 316(a) of the act that would allow us more certainty in our planning for new power facilities in particular. If we can make a demonstration that the water quality standards for the particular waters that are receiving the heated discharges can be met, we think that would provide a good showing that a 316(a) variances should be approved.

Let me try to give you an example of the problems we face in the industry in trying to deal with the present language under section 316(a) in building new facilities. We have to plan, as you well know, many years in advance of purchasing and building powerplant facilities. In this process we have to choose our equipment based on whether or not we are going to be allowed to discharge heat into the water bodies, or whether we have to build a cooling tower to treat the heated discharge. That affects the entire design of the powerplant.

So we need all the certainty in that planning process that we can have. It is extremely difficult to operate under the present language of the act, making a clear demonstration before States, Federal agencies, and others in public hearings that we have made a successful biological demonstration for a variance as required in section 316(a). We would have to complete several years of biological studies on a water body in advance of having a thermal discharge to satisfy that requirement. We can more simply make a demonstration that the thermal water quality standards would be met.

Those water quality standards are set by the State agencies, reviewed by the Federal EPA and are designed to protect and maintain a balanced indigenous population. We would like very much for you to consider this as you are discussing the modifications to the act, and consider introducing language that would allow us to

make a successful thermal variance demonstration through showing that the water quality standards for the thermal discharge will be met.

We would also like you to consider the removal of the term "indigenous" from that section of the act. We do not think that we should be required to make a demonstration that the exact, precise indigenous population will be maintained in the small affected area of the discharge. In some cases it might be desirable to have slight changes in the indigenous population. We would like some flexibility in this section of the act so the States would be able to decide whether it is desirable or acceptable to have some slight shift in species or quantity of particular species in those relatively small affected heated discharge areas.

I would like now to turn briefly to the term of the NPDES permits. We have previously supported the extension of the permit term to 10 years. We think that once we apply best conventional technology and best available technology, that the term of the permit could easily be extended, and it would save all of us a good bit of work. I can tell you from my own personal experience that it is a great job to prepare applications for a facility, particularly a powerplant. It is also a very extensive process.

There are something like 50,000 NPDES permits outstanding. We think that the burden of reissuing permits could be substantially reduced if the term of the permit were extended. As the House Oversight Subcommittee stated: Extending the permit term to 8 to 10 years would allow more effective utilization of the overburdened regulatory staffs. We certainly agree with that conclusion, and we do not think this would risk achieving our goal to have fishable and swimmable waters.

I would like to comment briefly, if I may, on the antibacksliding provisions that have been discussed in the Senate. We are strongly opposed to these antibacksliding provisions for a number of reasons. They would be very counterproductive environmentally, economically, and socially. The provision would lock into the permit all of the permit conditions and remove the flexibility the State needs in making decisions. It could prevent the expansion of a facility, or an increase in production at an existing facility.

As an example of what the antibacksliding language could do in the electric industry, if I were to build the first of several units at a new powerplant, and designed one outfall for the thermal discharge, making a successful demonstration to operate that unit with onstream cooling, then wanted to build a second unit discharging through that same point I would not be allowed to discharge more heat. This would effectively prevent me from obtaining a 316(a) variance under existing law because I could not discharge additional heat from that point.

We have other treatment facilities that would be affected much the same way. For example, we collect the ash from our powerplants in lagoons which have a discharge. When we initially open a powerplant site, we build that facility large enough to accommodate additional units. Because of that, the treatment may initially be somewhat better than necessary to meet the effluent limitation. But over time as more ash is collected in the pond it degrades slightly the efficiency of that treatment system. If I were to be

faced with compliance with an antibacksliding policy while building a new powerplant, I would probably design my treatment facilities in such a way that they would only barely meet the effluent limitation rather than going beyond that level of treatment, because I could not afford to be locked into a greater level of treatment if I could not further expand that facility.

We would like you to consider those problems as these matters are being discussed. I think that ends my comments, so I would like to turn to Mr. Gibson who will speak on water quality standards and section 404.

Mr. McNULTY. Mr. Gibson, good morning.

Mr. GIBSON. Good morning, Mr. Chairman, members of the subcommittee. I am John Gibson, an attorney with Pacific Gas & Electric Co. and chairman of EEI's Clean Water Act Issue Group.

As Mr. Smith indicated, I would like to discuss the water quality standards and section 404 provisions of H.R. 3282. The water quality standards provisions make changes in three main areas, toxics control, antidegradation and use upgrading and downgrading. EEI believes that these amendments are unnecessary since current EPA rules already cover these matters effectively.

Enacting H.R. 3282 in its present form would serve only to disrupt and delay ongoing EPA and State regulations under existing statutory provisions and EPA regulations. Section 7 of the bill would require EPA to develop individual control strategies involving limitations beyond BAT for discharges of toxic pollutants. In effect, this provision would place primary responsibility for regulation of toxics to insure compliance with State water quality standards in Federal hands.

EEI strongly opposes this provision for two reasons. First, it is unnecessary because EPA already has adequate authority under the act to make sure the States exercise the power, indeed the duty, Congress imposed on them under the act to implement water quality standards by establishing limitations necessary to achieve those standards.

Second, the provision is inconsistent with the existing act which places primary responsibility on State regulators rather than on EPA for setting, implementing, and enforcing compliance with State water quality standards. Section 303 of the act requires States to develop water quality criteria sufficient to attain designated uses. EPA is required to review proposed State standards and to insure that they are consistent with the requirements of the act.

Further, the act requires achievement of limitations necessary to implement applicable water quality standards. These requirements apply to toxics, just as they do to conventional pollutants, and are now being implemented by the States for toxic pollutants. Clearly then the act already provides adequate mechanisms for controlling toxic discharges. These mechanisms must be implemented by States subject to EPA review and oversight.

Section 6(b) of the bill narrowly restricts the circumstances under which new or increased pollutant discharges may be allowed. This provision was inserted in response to EPA's proposals to revise its existing nondegradation regulations. As you are no doubt

aware, the administration has now reworked its regulatory proposals on antidegradation and on use downgrading and upgrading.

EEI believes that antidegradation provisions cut irrationally across the established technology based and water quality provisions of the act, and thus are bad public policy. EPA is making efforts to deal with these issues in a reasonable fashion by regulatory means within the existing structure of the act. Whatever may be the outcome of that regulatory process we believe that it is unwise to codify and thus freeze in statutory language such detailed aspects of the water quality program.

Even if Congress felt it necessary to codify EPA's current antidegradation rules in the statute, however, section 6(b) does not do so. It goes far beyond EPA's current regulations. For example, it omits the crucial language in EPA's regulations requiring a State's antidegradation policy conform to section 316(a) of the Act, thus risking nullification of the act's important thermal variance provision.

Section 6(b) also goes beyond EPA's current rules by prohibiting new or increased pollutant discharges unless one, such discharges are necessary to accommodate essential economic and social developments, and two there is no feasible alternative to the development.

While we believe that new powerplant construction should clearly qualify under the essential test and will frequently do so under the no feasible alternative test, these tests we believe are unduly restrictive and burdensome. The antidegradation provision is further flawed in that it would require States that choose to allow new or increased pollutant discharges to take all practical steps to minimize the effects of development on water quality. If read broadly, this provision could require permittees to offset new or increased discharges by instituting control measures on other sources where practicable. Thus, it may introduce into the Clean Water Act complex offset requirements which are similar to those which have caused such confusion under the nonattainment area provisions of the Clean Air Act.

For these reasons EEI believes section 6(b) should be deleted entirely, or at the very minimum must be conformed to EPA's current regulations.

Section 6(a) of the act would codify EPA's present regulations on use downgrading and upgrading. This is both unnecessary and counterproductive. As I have said, the Agency is working with Congress to resolve these issues by regulatory means, and there is no reason to believe that its efforts will not produce reasonable and adequately protective regulations which implement the goals of the act.

This process should not be short-circuited by legislation. We think that it would be unwise to engrave in stone any particular set of detailed requirements or prohibitions on use downgrading or upgrading. Such an approach deprives EPA of the flexibility needed to accommodate changing circumstances.

Turning finally to section 404, we believe that there is no demonstrated need for the wholesale and fundamental changes proposed by section 10 of H.R. 3282, that those changes are unwise and that the statutory language should be left broad and flexible so that it

20-955 O—84——112

can accommodate continued regulatory evolutionary development which experience with complex section 404 programs will produce.

First, section 10(a) would enshrine a narrow single factor standard, "unacceptable adverse effect on the aquatic environment," which deprives the corps and EPA of needed flexibility in permit issuance.

Second, section 10(a) would require evaluation of all practicable alternatives in every case. Thus, even where the proposed construction would not constitute a major Federal action this statutory language would still require a formal NEPA-like review of alternatives with its attendant delays.

Third, section 10(a)'s least damaging practicable alternative requirement imposes a quixotic pursuit of environmental purity with insufficient regard for cost. This concept of practicability, which is apparently derived from EPA's present guidelines, purports to take economics into account. However, if those guidelines are any indication of how the section would be interpreted, cost-benefit analyses will not be made and an alternative would be excluded from consideration only if it can be shown to result in wholly disproportionate costs.

Under this standard a powerplant could be forced to adopt an unwanted alternative at a substantial increase in cost, even though discharges at the proposed site will not result in any significant impairment of water quality.

In sum, section 10(a) will codify an excessively stringent standard, it will delay powerplant construction by instituting a NEPA-like evaluation of alternatives, and it could require noneconomic siting of new powerplants with the obvious consequences of substantial increases in the cost to ratepayers for only speculative improvements in the environment.

Section 10(b) deals with procedures rather than standards, but it would have a similarly stultifying effect on powerplant siting. Section 10(b) substantially complicates the procedures applicable to the review of individual permits by EPA, the Department of Interior and the Department of Commerce. This reverses congressional commitment to the shortening of time for permit processing as evidenced by present section 404(q). There is no reason to believe based on experience in the field that the existing delicate balance of agency interests should be so decisively altered.

Thank you very much. That concludes my testimony.

Mr. McNULTY. Thank you, Mr. Gibson. Do you both yield to questions?

Mr. GIBSON. Yes, we do.

Mr. McNULTY. Mr. Stangeland.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Smith, what would be the potential economic effects of the amendment related to thermal discharges that the administration proposed last year?

Mr. JERREL SMITH. If my memory serves me correctly, the information we submitted to this committee last year indicated that the cost to the industry would be on the order of $2 billion by the year 2000 and roughly $230 million a year. That was developed through a survey of the industry, and I believe a report on that, if my memory is correct, was submitted last year.

Mr. STANGELAND. Again, Mr. Chairman, and you address this in your statement, but I would like to have you elaborate somewhat. What would be the adverse consequences to utilities of statutory antibacksliding requirements like those of S. 431?

Mr. JERREL SMITH. I mentioned some of the problems we would have with that provision. It will add substantially to the cost of a power facility. If we were to have to unnecessarily install a cooling tower on a powerplant, we would be spending a large amount of money, $35 million to $70 million, for one unit. And the installation of cooling towers reduces the overall thermal efficiency of the power system to the extent that on a large steam-fired unit, it would cause us to burn an additional 50,000 tons of coal per year simply because of that lost efficiency. So it is a cost matter.

It is a matter of putting our resources in the right spot and, of course, we are interested in not having to burden the ratepayer if we can avoid that. We think that using onstream cooling is very desirable, although cooling towers, where they are necessary of course, are being built, we would continue to do that.

Cooling towers have some adverse effects on the environment, although they are not, perhaps, terribly great. They are a tool we have to use, but we would certainly be locked out of using those in many cases under the antibacksliding provision.

Mr. STANGELAND. Mr. Gibson, if this committee were to adopt the beyond BAT approach taken in section (a) of H.R. 3282, what changes if any should be made to that section?

Mr. GIBSON. EEI believes, of course, that 7(a) is duplicative of existing statutory provisions, as I testified, and should be deleted. However, if it is retained, we believe the responsibility for the implementation of the program should be placed in the States rather than EPA, that the fixed statutory time period should be omitted or conform to the time periods in S. 431, and that the 3-year compliance period for individual sources should run from the time the individual permits are modified, rather than from the earlier date of final strategy promulgation.

Mr. STANGELAND. Thank you. No more questions, Mr. Chairman.

Mr. MCNULTY. Thank you, Mr. Stangeland.

Mr. Edgar.

Mr. EDGAR. Thank you.

Gentlemen, I wonder if you might, for the record, describe what the Edison Electric Institute is about. How large are you?

Mr. GIBSON. It is an industry association of investor-owned electric companies across the country. I think there are 189 members. They provide a very high percentage of the total electric service in the country. I don't have the figure. Maybe I can get it.

Seventy-eight percent, I am told, of electric service across the country.

Mr. EDGAR. So you are essentially an industry-oriented group that tries to look after the industry's needs?

Mr. GIBSON. That is correct.

Mr. EDGAR. That brings me to my question on the streamline thermal variance mechanism amendment that you have proposed. Wonder if you could in layman's language try to explain why you are so eager to see that variation in public law.

Mr. JERREL SMITH. Attempting to get a variance in advance of building a powerplant becomes a very uncertain engagement. I——

Mr. EDGAR. I guess what I am asking, I would like you to go back to stage one. We have all seen hyperbolic cooling towers.

Mr. JERREL SMITH. Yes.

Mr. EDGAR. We have seen other processes for cooling water that goes through an electrical process, an energy generating process. You make three specific statements as to why standard off-stream systems required to remove heat in cooling water, evaporating cooling tower, you go into three—you list them on pages 11 and 12. As I read them, they seemed pretty mild negative consequences except for the expense.

Mr. JERREL SMITH. Well, the expense is certainly important. Many utility managers are most likely going to avoid trying to do a 316 demonstration in advance of building a plant because of the long lead time and long process of trying to get approval through that particular process. The delays that may occur would simply force them to make a choice to install expensive equipment where it may not at all be necessary.

Mr. EDGAR. Do you do any studies of the negative economic impact if we don't do these things to the environment?

Mr. JERREL SMITH. Negative economic impact of onstream cooling, for example?

Mr. EDGAR. Yes.

Mr. JERREL SMITH. I don't think there is any economic impact of onstream cooling except if you were to put it on in a place where you could not meet water quality standards. Water quality standards are set to protect that stream. If we meet that standard that, it seems to me, should be sufficient to support granting of a variance.

Mr. EDGAR. I am still confused. I want to go back to ground one where we have got a generating plant. And we have to make a decision whether to cool the water in a particular way. What are you suggesting?

Mr. JERREL SMITH. I am suggesting that where the stream is able to accept the heated discharge, that is the most desirable means of dealing with that heat coming from the powerplant.

Mr. EDGAR. How hot?

Mr. JERREL SMITH. How hot? The rise of the water that comes from the powerplant is on the order of 20° above the incoming water. However, you must remember that State regulations require you to comply with certain standards in a mixing zone, you cannot affect the entire cross-section of a river, for example. There is a certain percent of the river that can be affected. And you will hardly find a 1° to 2° degree temperature rise, for example, at my powerplants, a 1° to 2° temperature rise a couple of hundred feet from where the plume goes into the river. So the overall water body is only slightly affected.

You have a general mixing zone that may have a 5°, 2°, and 1°, rise but it does not extend usually very far away from the powerplants. I am not sure I am getting at your question.

Mr. EDGAR. I am just trying to figure out whether or not there are any economic negatives. You are talking about the negative economics to you as an industry of having to cool your water before

it gets discharged. And I am trying to figure out, if you say everything is good, if you just dump it in the creek, is that in fact true.

Mr. JERREL SMITH. It is good to do so if you are meeting the water quality standards in my opinion, because it is the best balancing of the resources.

Mr. EDGAR. National water quality standards.

Mr. JERREL SMITH. Well, the thermal water quality standards which would, I believe, be set by the State and approved by the Federal EPA. Yes. Because those must be set to protect a balanced indigenous population in that receiving stream.

Mr. EDGAR. Now, how often would you think that there should be a variance?

Mr. JERREL SMITH. Well, the variance should only be issued one time because once you make a demonstration, unless there are some substantial changes it should never have to be redone, because the—you do not change the amount of heat that is discharged into that water body from that particular unit.

Mr. EDGAR. Who would monitor it?

Mr. JERREL SMITH. The companies are required under the NPDES permits to furnish information to the States on the discharges.

Mr. EDGAR. What happens after a company is found after monitoring to have been putting into the water, or into the main stream, water that is 25° or 30° higher than—what happens to them?

Mr. JERREL SMITH. Well, in the power industry that is terribly unlikely. I don't know of any that go above 30°. We are subject to all the laws of the Clean Water Act, we can be penalized for exceeding the thermal limits just like we can be penalized for exceeding any other discharge.

Mr. EDGAR. The only reason I am asking is that we have thousands of issues in terms of the kinds of water and water treatment and pretreatment and best available technology. And there are variations. What might be a very logical amendment that excludes, or gives you variance on your temperature variations may have an impact someplace else. It is very difficult for us as Members of Congress——

Mr. JERREL SMITH. I understand.

Mr. EDGAR [continuing]. To know every point at which water meets the main stream. What conditions are going to be——

Mr. JERREL SMITH. It may be useful, Congressman, to also remember that heat is really a very special, still classified as a pollutant but it does dissipate rapidly. It doesn't interact chemically with other pollutants. So it is a very special discharge and Congress recognized that when the act was drafted. We are only, we are not really saying we want to avoid making a demonstration. That is not true.

We want basically the present language or the present scope of the variance left in the act. We would like to have the opportunity indeed to make the existing biological demonstration in some cases and allow an operator to do that. Some thermal standards may have been set on the basis of best information at the time, but may be found to be too tight. If we can better use our resources and

make a demonstration under the present language of 316(a) we would like also to have that opportunity.

But as a first measure of whether we are going to comply, we would certainly prefer to have the State have the flexibility to allow us to make a showing of compliance with their thermal water quality criteria.

Mr. EDGAR. Thank you.

Mr. MCNULTY. Mr. Smith.

Mr. ROBERT SMITH. Thank you, Mr. Chairman.

Mr. Smith, I continually hear you discuss the cost to the industry. You are a public utility. I assume that means that it is an increased cost to the consumer, because you pass on those costs to the consumer. Therefore, I want to make sure that—if I were going to put you out of business and create a whole group of unattainable criteria I couldn't put you out of business because you would pass on those costs to the consumer. I want to make sure we are talking about protecting water standards in the most efficient way. That is what I thought I heard you saying.

Mr. JERREL SMITH. Well, indeed, the reason we are concerned is that the consumer does pay the price. I don't particularly feel that I have a special interest here except to protect my consumer. And the consumer uses the water body as well as I do, and we are not anxious to do something that would ruin that water resource.

At the same time we don't want to ask our consumer to pay for something that really isn't necessary.

Mr. ROBERT SMITH. Thank you.

Mr. MCNULTY. Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman.

Either Mr. Gibson or Mr. Smith might wish to answer. Are there different standards regarding thermal standards, from State to State or from the State to the Federal?

Mr. JERREL SMITH. I believe the answer to that is yes. I operate in Missouri. And I happen to know what Missouri standards are. They are very compatible with Illinois, our neighbor, of course. There are certain other States up and down the Mississippi that have similar standards. I am not familiar with coastal zones. Maybe Mr. Gibson could address that.

Mr. GIBSON. Our State standards are probably pretty consistent with other States if dealing with the same water bodies, but they differ substantially within the State where they are applied to estuaries as opposed to open ocean, as opposed to streams.

Mr. PACKARD. That was my next question. Is there different standards or does the law, both State and Federal, permit different standards to be applied relative to thermal discharge as relates to rivers and streams with ocean? Apparently it does.

Mr. GIBSON. Yes, it does in California, and I think that is true elsewhere as well.

Mr. PACKARD. So the law does give enough flexibility in that area because ocean dumping obviously would have a significantly different kind of environmental effect than would that river or stream.

Mr. GIBSON. That is true. That is right. I think that is really the core of Mr. Smith's testimony, why compliance with State water quality standards should allow someone to get a 316(a) variance. Because the State water quality standards have been set very tight-

ly, certainly in California, which I can speak of. I am sure it is true of other States and are subject to EPA approval.

EPA has been quite vigilant in being sure that the State water quality standards are set at a level which are very protective of the water body. Indeed in some cases they are set so stringently that my company is seeking 316(a) variances to not have to comply to California State thermal water quality standards because we contend and we think our biological demonstration shows that the receiving waters are completely protected even though we do not quite meet the State water thermal standards.

Mr. PACKARD. Have there been studies that have indicated at any time that environmental considerations and plant and animal life have been enhanced because of thermal changes as a result of discharge?

Mr. GIBSON. I think that—the biological activity is increased from heat, so that we have some marine, mariculture developments at our outfalls, oysters, other shellfish, things of that nature where they are being grown commercially because the heated water is more efficient for growth of marine life. Also, the fishing certainly is very, very good at our outfalls because at almost every one of our powerplant discharges we find great congregations of fishermen who come in and catch fish there. So they tend to be very rich and productive marine areas.

Mr. JERREL SMITH. May I comment further on that, sir?

Mr. PACKARD. Certainly.

Mr. JERREL SMITH. I think what Mr. Gibson has said is true also on the inland water bodies. We have very good fishing areas along the discharge from powerplants in the late fall or wintertime. Fish tend to congregate and indeed would grow more rapidly in the warmer areas of the heated discharge in the wintertime and will avoid those areas when the temperatures rise in the summertime. This is an area of question as to why I raised the point on exactly the same indigenous populations. But the heated discharges are a very popular fishing spot.

Mr. PACKARD. Has there been any effort in those studies, or have the studies gone far enough to determine or become specific enough to be able to make determinations as to cost values of such benefits in terms of maybe relating that to a cost-benefit ratio as plants and projects are being considered?

Mr. JERREL SMITH. So far as I know, the answer to that is no.

Mr. PACKARD. In other words, those are just a forgotten benefit if they are benefits?

Mr. JERREL SMITH. Yes, sir, so far as I know.

Mr. EDGAR. Mr. Chairman.

Mr. MCNULTY. Mr. Edgar.

Mr. EDGAR. I just wanted to get back to the question you were raising. On page 14 of your statement you talk about those indigenous populations of aquatic life and you go on to talk about, and you say rather a satisfactory demonstration should be based on maintenance of a balanced population. Some species will avoid, others will be attracted to the warmer waters. These subtle nonpersistent species shifts are not the sort of significant adverse environmental impact that should automatically require expenditure of so-

ciety's limited resources on expensive multimillion dollar cooling towers.

Can you tell us what evidence that these effects ought to be ignored? Do you have some specific data in your studies that—you have mentioned the positive impacts to fish and fishermen and oysters and the good things that you can create at the outfalls of the water. Are there some negative impacts that you have discovered in your studies?

Mr. JERREL SMITH. The shifting of the species will occur in a very limited zone around the thermal discharge area. Which is usually a very small area in the water body. And in some periods you will find a perhaps lower population of fish right in that particular area. Perhaps in the summertime. Maybe because of turbulence of that outfall more than even the temperature of that outfall. Fish just tend to avoid these zones.

There are certain zones, for example, in the Mississippi River you just don't find fish at all whether there is a discharge or not, because the fish seek certain areas of the river. You don't find fish in the center of the Mississippi River. Indeed one of our outfalls on one of the newer plants was placed in the center of the river simply to avoid those more active biological areas. There are no fish out there. We find that either with or without thermal discharge.

Mr. EDGAR. Thank you.

Mr. MCNULTY. Mr. Smith, with respect to your testimony about powerplants, are you talking about coal-fired steam plants?

Mr. JERREL SMITH. This could be either coal or nuclear on a thermal discharge.

Mr. MCNULTY. I think that in my modest experience in the arid West I didn't know there were coal-fired steam plants that didn't have cooling towers.

Mr. JERREL SMITH. In the West that probably is true. You may not have enough water for onstream cooling and the only alternative in that event is either natural draft or forced draft cooling towers. That is correct.

Mr. PACKARD. Would the chairman yield, please?

Mr. MCNULTY. Indeed.

Mr. PACKARD. Along the coastal areas, coal certainly is an alternative that could be used. Most of them are not using coal. But I don't think it is because of the requirements to mitigate thermal discharge in the ocean. The ocean temperatures, and apparently the ocean is becoming, coastal areas are becoming a rather preferred area for the siting of these because there is a great body of water that thermal discharge doesn't change the temperature of the ocean, off the coast of my city anyway, we have got a major plant there, probably more than two degrees.

That is certainly, has very little effect upon the environment. But it does have some improving effects upon the fishing. And that I am aware of. So I think that it depends a lot on the body of waters that you have in order to discharge your thermally changed water.

Mr. JERREL SMITH. Mr. Chairman, that is indeed true. You cannot take all the water from a river and run it through a powerplant, nor would we ever attempt to do such a thing. This whole

area of thermal discharge is one in which the States really need flexibility to judge how the use their resources. In the arid Midwest you are simply going to have to use cooling towers. On the coast you have a lot of water to use for cooling. On the Mississippi River we have a lot of water to use for cooling.

Mr. McNULTY. And you have got a lot and it is cheap, and where you are going to put it back there is a great deal there, too. So that is a great deal more efficient than pumping and cooling towers and blowing down and fans and all of that.

Mr. JERREL SMITH. It is much more efficient as I indicated. It also reduces the amount of fuel that you use if you are able to use onstream cooling, because the efficiency of that thermal cycle is improved.

Mr. McNULTY. Is the water, does it cool through an evaporative process or a conduction?

Mr. JERREL SMITH. You draw the water from the water body and run it through a large bank of tubes over which steam passes from your turbine. That drops the pressure within that chamber to something like 2 inches of mercury absolute. That allows you a larger pressure drop across your turbine, gives you a greater potential generation of electricity as this back pressure as we call it increases.

It does increase with the higher temperature. The efficiency of that thermal cycle then is further reduced and you simply have to put more fuel into your plant if you are going to generate the same number of kilowatts.

Mr. McNULTY. So the western arid plants which use evaporative cooling towers, and consequently of an enormous concentration in solids, that doesn't occur in the kind of situation that you are testifying about. The water that comes back into the river is the identical quality as the water which is extracted from the river.

Mr. JERREL SMITH. It comes in in identical quality with the exception of in some cases there are introductions of chlorine for biological fouling control and there are certainly limits placed on that. That discharge as well.

But on my plants, for instance, the water is drawn in and sent out without being touched, aside from the transfer of heat that goes into it.

Mr. McNULTY. The plume that is created by feeding back the warmer water, what are the furthest limits of some temperature differentiation in those limits in your experience?

Mr. JERREL SMITH. Well, a 1° temperature rise can go some distance downstream. A mile or two, perhaps. And it isn't going to cover the entire stream in my experience.

Mr. McNULTY. Would a 2-mile radius then of some measurable increase in temperature be the maximum in your experience?

Mr. JERREL SMITH. I don't believe that I could say that absolutely. I am only looking at one particular site on the Mississippi River. This would vary a great deal. Whether you are on a swift flowing river or whether you are on a larger impoundment such as one of the lakes on the Mississippi, the plumes will look differently. Some of the plumes also will lie more on the surface of the lake and you will measure only the temperature there, which is prob-

ably more desirable. Other plumes when we are in a fast-flowing stream we like to get high turbulence and fast mixing.

On one plant we installed on the Mississippi a center river discharge, that both avoids the bank and the biologically active areas. It gets very turbulent and fast mixing. So that when my fellows go out to try to measure the thermal plume they have a very difficult time holding the boat close enough to that 5° thermal plume to even find it.

Mr. McNULTY. Thank you very much, sir, Mr. Gibson.

Are there any questions? Members of the staff?

Mr. Gibson, Mr. Smith, we are grateful to you for your testimony here this morning. Thank you.

Mr. GIBSON. Thank you, Mr. Chairman.

Mr. McNULTY. From Arthur Young & Co. the next witness is Mr. Harvey Goldman.

Good morning and welcome, and we would be pleased to hear from you now.

Mr. Goldman, the full test of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF HARVEY GOLDMAN, PARTNER, ARTHUR YOUNG & CO., ON PRIVATIZATION OF WASTEWATER TREATMENT FACILITIES

I am honored to be here today to discuss Privatization, public/private partnerships to help meet the enormous need for wastewater treatment facilities facing communities across the nation. The United States Enviromental Protection Agency's 1982 Needs Survey documented $118 billion worth of needed facilities. Add to that the needs of communities which are not on state priority lists because their needs reflect desires of growth and economic development, which EPA does not fund, the total dollars necessary to meet the country's demand for wastewater treatment construction is even more staggering.

The EPA's Construction Grants program has provided many communities with the financial wherewithal to build treatment facilities. However, at the current authorization level of $2.4 billion, only a small dent will be made in the capital investment needed to meet our clean water goals and to support the growth and development so vital to our economic well being. I have seen in my research and work to date a very sincere expression of interest on the part of respectable private sector firms to undertake such investments and pursue the business opportunity of building, owning and participating in the operations of wastewater treatment facilties. I have also seen a strong desire on the part of certain state and local government units to pursue any legitimate alternatives to local funding to put these capital intensive facilities into service, and to ensure that they will be properly operated and maintained.

The privatization concept is not necessarily an alternative to the Construction Grants program, but at a minimum, it should be used to help supplement the grants program. Privatization is based on the sharing of benefits. When a private sector firm designs, finances, constructs, owns and operates a facility, the firm realizes a number of economic advantages. These are shared with the community in the form of lower user fees compared to those required if the facility were obtained through local funding sources.

The privatization concept for wastewater treatment facilities was developed by Arthur Young when the State of New Jersey was looking for ways to help meet its $2.4 billion wastewater treatment needs, given the expectation of federal grant monies to provide less than one-fifth of the total need. Having previously done quite a bit of environmental consulting work for the State's Department of Environmental Protection, we were asked to investigate sources of funding in addition to the grants program. Private sector involvement envolved as potential solution. Let me explain.

Three types of savings contribute to the private sector's ability to provide facilities at a lower cost. These are construction savings, operational efficiencies and tax benefits. Construction savings result from the private sector's ability to procure ma-

terials and proceed through the different project stages, such as design and construction, at a much faster rate than that at which municipal project proceed. Cases have been documented in Tennessee, Pennsylvania and Colorado where facilities have been put in service in a much shorter time and at a much lower cost compared to if federal funds had been used. From our work in this area, we have conservatively concluded that compared to a treatment facility built through the construction savings of approximately 20 percent of the project's cost.

Operational efficiencies are another source of savings for the private sector. It must be remembered that the private sector will take a businessman's approach to wastewater treatment. Therefore, service provision will be treated as a product to be sold and profited from Quality service at a lower cost will be sought through well-trained and experienced employees, and through economies of scale when a firm opeates more than one facility. I believe it important to note that the private sector recognizes the need to address the considerations of municipal employees, including how those employees can be incorporated into the work force when the private sector firm takes over operation of a municipal wastewater treatment system.

In addition to the private sector's ability to construct and operate plants more efficiently than the public sector, resulting user fees can be lowered further when the private sector uses tax benefits to lower the overall project cost. Changes to the tax law in 1981, which were carried over in 1982, allow equipment and machinery to be depreciated over 5 years and structures over 15 years. Along with accelerated depreciation, the private sector can take advantage of various types of tax credits and deductibility of interest payments if the project is financed with a combination of debt and equity. Typically debt financing would encompass the majority of the total project cost. Privatization provides especially attractive user fees when construction and operational efficiencies and tax benefits are combined with Industural Development Bonds (IDBs) to finance the facility.

Even with this combination of benefits, the economics of privatization for an identical facility can not compete with a 75 percent federal construction grant when resulting user fees are compared. However, in our privatization work to date, we have seen a privatization approach result in user fees that would be the equivalent to what would be charged if the community were to have received a 40 to 60 percent grant to construct the same facility. If the availability of IDBs was limited and the tax laws were to be changed, the potential benefits of privatization would be significantly reduced, perhaps putting clean water out of the range of economic viability for many communities in need.

As currently written in the law, it is permissible to use IDB's in conjunction with the full range of tax benefits described above. However, as we understand it, proposed legislation before the Senate Committee on Finance would limit the use of IDBs to resource recovery facilities. An underlying assumption used in the determination to impose limitations on the use of IDBs, is that the Federal Government is at a financial disadvantage in allowing transactions that provide both the advantages of IDB financing with accelerated depreciation tax benefits. I believe it is important to point out the following:

Our firm performed an analysis of a medium sized wastewater treatment project under the following scenario: assuming that without private investment the project will not proceed due to municipal debt limitations or the desire to "wait" until federal grants become available, what is the true impact to the federal government of a private investment in such a facility? This true impact considers not only the tax benefits generated, but also the taxes paid by the private sector.

The results of our analysis are interesting to say the least. When one considers the Investment Tax Credit and accelerated depreciation benefits, as well as the taxes paid by the private firm on annual revenues from the community, the taxes on income earned by construction workers involved in building the plant and the taxes paid by the general contractor and equipment and material suppliers, the U.S. Treasury does not necessarily lose on such a project. In fact, we believe that certain projects may actually produce a positive effect on the Treasury in terms of total tax benefits versus taxes paid over the life of the agreement.

It could be argued that construction workers and equipment suppliers could earn their money elsewhere and thus still pay taxes regardless of these projects. On the other hand, when in recent years has the construction and equipment industry been 100 percent utilized? It could also be argued that since most of the tax benefits accrue in the first five years of ownership/operation, the Treasury will still lose on a present value basis even if it breaks even over the long term. This is true on the surface but our analysis does not include the secondary benefits to the economy of increased employment in the construction, equipment and materials industries, or the economic development which will result from wastewater treatment services. It

also does not consider FICA payments. A third argument is that such projects would probably proceed without private investment. Due to the limited availability of federal funds and municipal debt limitations, we believe that private investment is essential to get projects moving. A community we are working with in New Jersey is a case in point; its current debt is only 25 percent of its total debt ceiling and yet proposed wastewater facilities would cost twice as much as the City's remaining debt capacity. This does not even consider the City's remaining needs for water, solid waste and other municipal improvement needs. Unfortunately, this City is by no means unique and many others are faced by much more difficult situations.

A final and important consideration is the realization that some communities will be fortunate enough to receive federal grants from the Treasury equal to 55 percent of eligible project costs. For the thousands of communities who cannot receive this direct federal aid, it would seem that the indirect aid of the federal tax laws should still be made available not only for wastewater treatment but also for water and solid waste facilities. The fact that such aid is not necessarily a drain on the Treasury and, in fact, may result in a positive or breakeven situation, is more reason to help America's communities.

There are those who express the concern that the use of tax benefits to enhance the economics of privatization is a misguided policy. I suggest that every businessman typically looks at investment opportunities from a perspective that includes the tax impact. If investors are looking solely for tax benefits, they will find them somewhere. What better use of tax incentives than to supplement or enhance the economics of private investments to rebuild our infrastructure.

Privatization is a means by which the Federal government can draw upon the private sector to achieve goals for the common good. The Federal Government has used similar approaches in the past, The same sort of tax incentives that are being discussed here with regard to wastewater treatment facilities were used to spur the development of hydroelectric facilities some 20 or 25 yeas ago. And, they are being used currently to foster the development of the resource recovery industry. There are a number of reasons why the Federal government should consider retaining both the use of IDBs and the Federal tax incentives for the privatization of wastewater treatment facilities. First and foremost, privatization can help meet the enormous capital needs we now face. In addition, private sector ownership and operation of wastewater treatment facilities, if properly controlled, will provide additional benefits.

It is a well known fact that private sector compliance with the requirements of the Clean Water Act has well surpassed that of municipalities. Another accomplishment of the private sector's in the field of wastewater treatment is in regard to the private sector's in the ability to operate and maintain treatment plants. While there are municipalities that properly operate and maintain their facilities, in many cases communities are struggling in their efforts to run the expensive and complex plants that were paid for by Federal grants. The municipal compliance rate on an overall basis is extremely disappointing. One major problem facing many municipalities is their inability to attract and retain the qualified staff necessary to operate these facilities.

A number of well known and highly respected governmental and industry groups have recognized the important role that the private sector can play in meeting our clean water goals. Almost a year ago the National Water Symposium was sponsored by 13 key groups and associations. These groups were as follows:

American Consulting Engineers Council;
American Public Works Association;
American Society of Civil Engineers;
National Society of Professional Engineers;
Water Pollution Control Federation;
Council of State Governments;
International City Management Association;
Municipal Finance Officers Association;
National Association of Counties;
National Conference of State Legislatures;
National Governors' Association;
National League of Cities; and
U.S. Conference of Mayors.

The executive summary of the proceeding contains the group's collective recommendations, Specifically relating to privatization they recommend that:

"In order to control costs, public utilities should consider utilizing the private sector to provide operation and maintenance services."

"Federal and state laws, where necessary, should be revised to:

"Provide for the creation of profit and non-profit organizations or corporations for the purpose of pooling public and private funds to finance water infrastructure.

"Authorize the exploration of use of the private sector through tax benefits, tax credit transfers, and leasebacks."

Interest in privatization is very wide-spread, Particular interest has been expressed by a White House group, which was organized to study the potential role for the private sector in lowering federal spending. Commonly referred to as "The Grace Commission," the group's full title is the President's Private Sector Survey on Cost Control [PPSSCC]. Arthur Young was asked to prepare a report on wastewater treatment privatization. A recommendation from the PPSSCC report read, "Private construction and ownership of wastewater treatment plants is a viable way to reduce state and local dependence on Environmental Protection Agency Construction Grants."

Many states are looking toward privatization to meet their wastewater treatment needs. To date Arthur Young has worked with over 25 states in explaining, discussing and analyzing the potential of privatization for their particular infrastructure needs. State support of the concept has been overwhelming. Even Governor Kean of New Jersey, in formulating his Infrastructure Bank, points to the State's desire to promote the privatization concept for sewage treatment facilities as a way to reduce the demand for limited public funds. Recently, a large, western city was interested in determining whether privatization could meet their wastewater treatment needs. The Governor of the State decided to show his support of the concept by providing state funds for part of the study. We have also worked directly with other governors and their cabinets. I understand that the National Governors' Association has taken a collective stand opposing the proposed limitations on the use of IDBs.

Many will agree that privatization is an economically viable way to finance and provide the delivery of efficient and cost-effective wastewater treatment services. However, it should be mentioned that determining the economic viability is just one part of a complete privatization feasibility analysis. Attention must be given to determining that privatization is approached in an orderly fashion, and that the interests of the community, and of the public sector in general, are well protected. The need for an oversight program in any privatization arrangement can not be overemphasized.

In summary, privatization is being looked to by many as an alternative means by which to obtain needed wastewater treatment facilities. Federal grants may be the way for some, but the amount of available grants can not meet the immense need which exists. What better way to provide funds for the nation's infrastructure, than through drawing upon the private sector to pursue the business opportunity and the immense need at hand. The private sector will not only get needed plants built, but in addition will create jobs, foster construction and equipment sales and generate tax revenue. Privately owned plants will pay real estate taxes to the local community and sales and income taxes. I respectfully urge the Committee to further consider the merits of the privatization approach, and I would be pleased to assist you, if I may be of further aide. Thank you.

Mr. McNULTY. Please proceed.

TESTIMONY OF HARVEY GOLDMAN, ARTHUR YOUNG & CO.

Mr. GOLDMAN. Thank you, Mr. Chairman. I am honored to be here today to chat with you. I have prepared a formal written testimony that you have placed in the record. So, in the interest of time, and perhaps also in the interest of getting the key concepts across, I would really like to paraphrase the nuts and bolts of this commentary for you.

Mr. McNULTY. Please do.

Mr. GOLDMAN. At Arthur Young among my responsibilities I head up our consulting practice to the water industry and waste-water industry. Our services mainly focus on providing financial and management advice to water and waste-water facilities. What I would like to chat with you about today is some of our recent work in the financing of waste-water treatment facilities, as the financing problem of $118 billion worth of needs certainly is a significant problem that the subcommittee is confronted with.

We had the privilege approximately 2 years ago of working with the State of New Jersey in a formal project to help them address how they could meet the spread of approximately $2 billion from that State's needs for facilities as indicated on its State priority list versus approximately $400 million that the State could count on through the grants program, or roughly a $2 billion shortfall. The results of our research which was done in conjunction with a number of key State agencies indicated that a concept which we called privatization, or private sector involvement in designing, constructing, owning, and participating in the operation of these facilities could really serve to help bridge the funding gap that faces New Jersey as well as other States in this country.

I would like to take a few minutes explaining to you how we reached that conclusion, and then bring to your attention certain factors which you may or may not be aware of which could significantly influence the potential use of the privatization concept in future periods. What we saw in our investigation is that when a private sector entity is involved designing, constructing, owning, and participating in the operation of these facilities, significant economic benefits will be achieved compared to a project undertaken either with grant funds or totally with local funds.

For example, significant construction savings will result when a community does not have to follow Federal and State procurement laws that are necessarily involved when Federal and State money are involved in funding the facility. The written test I submitted to you indicates some cases we researched in States such as Tennessee, Pennsylvania, and Colorado, where in the absence of Federal and State funding needed facilities were put in place in 1 to 2 years, compared to the typical time period of 4 to 8 years that it takes to get a federally funded facility put into service.

By saving time and by saving compliance with many of the so-called bureaucratic procurement regulations, significant cost savings resulted. Arthur Young is a very conservative firm by nature. We feel very confident when we make a statement that at a minimum there will be at least a 20 percent cost savings in a facility constructed without the aid of Federal dollars compared to one built through the grants program others with significant relevant expertise have confirmed to me that a 20-percent savings in the cost of a treatment facility is a safe statement.

Our research indicated cases where 50 and 60 percent of the estimated construction cost through the grants program was saved. This involved cases where a community bypassed grant funding and also bypassed conventional EPA-approved technology. Another key benefit we saw where the private sector is involved in an ownership role is the tax benefits which will result. These stem primarily from the 1981 tax laws referred to as the Economic Recovery Tax Act of 1981. Those tax laws were deliberately put in place as we understand it to encourage private sector investment in this country.

What we saw when applying these tax laws to waste-water treatment facilities is that for tax purposes roughly 80 to 90 percent of the investment in a waste water treatment system qualifies for 5-year accelerated depreciation. The bulk of the remaining portion qualifies for 15-year depreciation.

In addition to the opportunity to utilize the benefits of accelerated depreciation, if the private sector is legitimately involved in participating in the operation of these facilities, also an investment tax credit will accrue to the benefit of the owner, the investment tax credit being 10 percent of the eligible cost of the facility.

In addition to the investment tax credit and accelerated depreciation, the owner can deduct the interest expense and under present law it is possible to use industrial development bonds for the financing of these facilities, even lowering the interest cost by use of such tax exempt financing vehicle.

We have also seen from our research those situations where private groups are operating publicly owned facilities on a contract basis. There can be significant savings in operating costs of the facilities. The potential operating savings can be combined with the reduced construction costs and the tax benefits of private sector involvement. There are many extremely well run publicly owned, publicly operated treatment facilities in this country. However, many communities, especially the small communities, have great difficulty attracting and retaining the key qualified staff necessary to operate these relatively sophisticated facilities.

The private sector, on the other hand, especially if private groups are able to experience economies of scale by operating multiple facilities, unlike communities which for the most part would only operate single facilities, can pass on significant operating savings. Such savings would come from the ability to centralize administration, centralize key maintenance staff, bulk order chemicals and key supplies, and so forth.

Economies of scale. What does all this mean when you try to put together construction savings, tax benefits, finance, with industrial development bonds and potential operating savings? It means that we may well have a supplement to the grant program which on a very cost effective basis can put clean water within the economic reach of many communities in this country.

The privatization concept cannot economically compete with a grant program which funds at 75 percent levels. But it can economically compete with grant funding levels at the 55-percent level.

What we have seen in approximately two dozen feasibility studies that our firm has had the privilege of conducting around this country, is that the economics of privatization will generally range from a grant equivalency of about 40 percent on the low end to 60 percent on the high end depending upon site specific considerations.

So, as you can see when these factors are appropriately bundled to those communities that aren't fortunate enough to receive a 55-percent grant, there is another alternative which, if allowed to stay in place, can present them with the economics of a grant without many of the delays and much of the redtape that the grant program brings.

Now, there are certain actions which have been taken or have been contemplated to be taken by groups such as the Senate Committee on Finance to limit the use of industrial development bonds and also to consider limiting the availability of 5-year depreciation

for facilities owned by the private sector that are providing services, legitimate services to the public sector.

My feeling is that those benefits need to be carefully thought through because clearly, while there are and have been some abuses in the tax laws, and while there is a pressing concern to balance or to minimize the budget deficit in this country, there are some specific unique characteristics about utilizing these benefits for wastewater treatment plants that should be brought to your attention.

I should also point out that in the proposed changes in the laws that the Senate Finance Committee is addressing they have preserved full utilization of existing law for resource recovery facilities.

The case I would like to build is that wastewater treatment facilities should deserve equal treatment to the resource recovery.

Let me explain why.

Many people believe that utilizing these tax benefits is an inappropriate use of our tax policy because the Federal Treasury will be robbed.

I don't think that is the case in wastewater treatment. Even under a privatization approach, it will take in most cases approximately 2 years to put a wastewater treatment system in place for an average size community.

During that 2-year period, before any of the tax benefits can be claimed, there will be taxes paid by the engineering group that does the design, by the construction firm that does the construction, by the equipment manufacturers who sell the equipment.

There will be taxes paid on the labor component of these facilities which is roughly one-third of the cost. Our firm just completed an internal analysis to try to take a hard look at, given the tax benefits that go hand in hand with making privatization work, what about the tax payments that will result from letting the private sector put these facilities into service?

Not only will there be the tax payments which I just described, but also one must consider the fact that these systems that come into service that are privately owned will be paying income taxes, property taxes, real estate taxes to local communities and so forth. What we have concluded is that in most transactions the Government comes out ahead. I think this has to be emphasized to those that are looking to limit the use of these tax benefits.

For those of us who are concerned with the financing of clean water in this country, I think we have a responsibility to speak up and to take what action we can to preserve the benefits which are already in the law and which have already been designated for preservation with resource recovery to also have them preserved for what could be an emerging industry of private sector involvement in wastewater treatment.

Arthur Young is not the only group that has been looking to the potential benefits of privatization to help solve in a supplemental way the financing dilemma for clean water.

Over the last few months we have seen groups such as the National Water Symposium, which was convened about this time last year in Washington to address new directions in managing water programs in this country. The sponsoring groups of that sympo-

sium included the key engineering councils, Public Works Association, Water Pollution Control Association, Council of State Government, City Managers, Finance Officers, National Association of Counties, the National Conference of State Legislatures, the National Governors Association, the National League of Cities, and the U.S. Conference of Mayors and so forth.

Among the conclusions from that group's 3 days of meetings was the fact that the tax laws should be utilized to involve the private sector in getting these facilities put into service.

We also had the privilege of being involved with a group referred to as the President's Private Sector for Cost Control in Government, commonly referred to as the Grace Commission. We provided them with much of our analysis on the privatization concept. I quote for you one of the conclusions from that group.

> Private construction and ownership of wastewater treatment plants is a viable way to reduce state and local dependence on Environmental Protection Agency construction grants.

As I said, we are working in more than two dozen States, in most cases with Governors, with their cabinets, with the environmental agencies, and with pilot communities interested in going forward to become the first communities in those States to demonstrate that public/private partnerships can be formed to put necessary facilities into service. It is also important to note that an awful lot of care is being stressed to set up the appropriate checks and balances to protect the public sector's interest in these transactions.

I hope that my comments here today have brought this privatization alternative to your attention, if you were not already aware of it, and hopefully it may inspire whatever action you believe is appropriate to help protect the benefits under existing law so that these concepts can go forward and help meet our Nation's clean water goals.

Thank you for your attention.

Mr. McNulty. Thank you, Mr. Goldman.

Mr. Stangeland.

Mr. Stangeland. Thank you, Mr. Chairman.

Mr. Goldman, first off, could you provide for us or document for us specific instances for the record, not today, where there has been a 20-percent cost savings by private construction of a wastewater treatment plant?

Mr. Goldman. Certainly.

[The information received from Mr. Goldman follows:]

Supplemental Information Provided by Mr. Goldman

A well publicized situation arose in Carlisle, Pennsylvania. As reported, in 1982 the community "washed its hands of EPA to clean up waste and initiated a totally locally funded project. The engineer involved is quoted as saying that compliance with the federal regulations add "15 to 20 percent to the cost." What the town, or rather the suburban Carlisle Authority actually accomplished was as reported "to build a bigger plant than anything EPS would have approved" and they accomplished it for "about the same amount of money as its 25 percent local share of a federally funded project might have been." Carlisle's plant operating cost is said to be about half what it would cost to operate a conventional EPA plant.

Mr. Stangeland. As you said, even instances of 50 to 60 percent savings specifically.

Mr. GOLDMAN. Yes, sir.

Mr. STANGELAND. A number of suggestions have been made that more water quality protection could be provided nationwide if the current program, construction grants program, were to be converted to a loan program, particularly for plants not yet in the pipeline.

What is your reaction to that proposal, and would achieving our national clean water goals be advanced or retired by such a program reorientation?

Mr. GOLDMAN. I think that a number of new approaches are necessary to help solve the funding dilemma. Having had the privilege of working with the State of New Jersey, I am somewhat familiar with the infrastructure bank concept that has been conceived for that State as well as the infrastructure bank concept implemented in the State of Utah through our work with Governor Matheson.

In both of those banks, the concepts of low-interest loans are included. Also in both of those banks the concept of privatization to go hand in hand as a supplemental tool is included.

It may well be that there could be some facilities, some communities that would not be attractive for private investment as well as not being eligible for grant funding.

In cases like that loan programs could be very important. It also could be the case that loan programs combined with private investment could be, could go hand in hand and that loan programs combined with grants can go hand in hand.

I am delighted that a loan concept has also surfaced as an additional tool for us to consider in the financing of these facilities.

Mr. STANGELAND. Thank you.

You make the point that using accelerated depreciation, the different tax laws to encourage privatization or private construction really doesn't cost all that much to the Government because, while your engineers are working, they are paying taxes, and the construction firm is working and it is paying taxes, and on and on and on.

But that same engineering firm builds the plant under the construction grants program, so really you are not adding anything additional. You have got the same revenue coming into the Government whether it is privatization with tax advantages or whether it is under construction grants program. Isn't that correct?

Mr. GOLDMAN. Well, assuming that that plant would be built with grant funds, you are absolutely correct, but looking at the base of approximately 5,000 communities in this country that need facilities, and looking at $2.4 billion versus $118 billion of need, my point is that facilities would move forward which are stalled for lack of funding right now if the privatization concept was to take hold and to prove itself.

In addition, it is important to recognize that I guess a few years back, when the grant program was at, say, twice the $2.4 billion level, there were approximately 250,000 private sector employees involved in designing and constructing facilities. That number has been slashed.

The number of construction firms that have gone out of business in the last year is staggering.

The number of engineering firms experiencing layoffs is staggering. If you believe that the plant will be built through the grant fund, then you are absolutely correct.

Mr. STANGELAND. Very good. Thank you.

Mr. McNULTY. Thank you.

Mr. Edgar.

Mr. EDGAR. Thank you very much. Mr. Goldman, how many successful plants are now operating that are private sector plants?

Mr. GOLDMAN. Not very many. This is a relatively new concept.

Mr. EDGAR. Do you know of any?

Mr. GOLDMAN. Yes. There are a number of utility type operations that are owned by private investors that have been providing wastewater treatment services in this country for years.

For example, Atlantic City, N.J., is serviced by the Atlantic City Sewage Co., a privately owned entity. There are also a few others.

Mr. EDGAR. Are they presently, let's say Atlantic City, 20 percent cheaper in their construction and planning than would be a publicly owned facility?

Mr. GOLDMAN. I don't know that.

Mr. EDGAR. What I am trying to get at is the fact that there are so few, isn't what you are suggesting to some degree theoretical in the sense that you are suggesting that tax incentives are a more efficient way to build treatment plants than other forms, and that the private sector really could get into this business in a big way and we would, rather than having a few, we would have lots of investor-owned, privately owned municipal wastewater treatment plants?

Mr. GOLDMAN. Yes; from our research we have seen that there is no shortage of qualified private sector firms that would be interested in moving forward if the concept were to catch hold.

Also, in doing our research about the concept we tried to look back to see what parallels might there be in our country's history where tax incentives and other incentives were utilized to spur a need.

We looked at the hydroelectric industry where 20 to 25 years ago, as a way of fostering the birth of this industry, specific tax advantages and so forth were granted.

Mr. EDGAR. I think Mr. Stangeland was trying to get at this. With a $200 billion deficit, if we give tax incentives as the answer to this multibillion dollar problem, that is also an investment we are making. There is cost to that tax incentive. It is just not free money.

Mr. GOLDMAN. That is correct. Perhaps I wasn't clear enough in making my earlier points. That is that because of the fact that there is a 2-year construction period, significant tax revenue will come into the Treasury before any of the tax benefits are available to be utilized, because the plant has to be up and operational before you can claim depreciation.

That depreciation even under the most accelerated basis comes in over a 5-year period versus the other revenues coming in in the initial years as the plant is being built.

Mr. EDGAR. What would keep you from having a private investor-owned waste water treatment center cut corners in order to have more profitability back to their investors?

Mr. GOLDMAN. That is a very legitimate concern. We address that in all of our consulting work by working with the community to outline an oversight program that would be essential to protect the community's interest.

For example, by requiring a performance bond. By having the comunity's consulting engineering firm or another firm of its choice do independent operational reviews of that facility to be sure it is being properly operated and maintained. By specifying in advance and including in the contract the performance standards, maintenance levels, inventory levels, and so forth that have to be maintained, and, moreover, by having the private group that is operating the plant face the penalties of noncompliance if clean water standards are violated.

It would be a whole set of factors that would come together to address issues like you just raised.

Mr. EDGAR. What would you do if you had a privately owned plant, investor owned, and you found they were violating Federal standards and you said, naughty naughty. You are violating these standards. You are going to be fined, and they came back and said, We are going to file chapter 11.

We are going to go belly up. What recourse would the community have to come in, make the corrections, and keep that facility operating?

Mr. GOLDMAN. I don't have the appropriate legal background to properly address that question, but I would like to answer it as follows: That any community contemplating going forward in an approach like this has to be armed with a fine set of professional advisers, and questions have to be asked from various perspectives.

What are the worst things that could happen to us in this transaction? How will we be protected? By approaching it from a mode of identifying the risks and steps to prevent or mitigate the risks is the way to go forward.

Mr. EDGAR. Aren't you really saying that what you want is to be able to build with private sector investment, but with public dollars loaned or granted facilities that would not have to comply with public Federal laws such as the Davis-Bacon Act and other mandated provisions?

Isn't that really where you are getting your savings besides your accelerated construction?

Mr. GOLDMAN. Well, I am not saying that we shouldn't comply with these laws. I am saying that if these facilities were built through a private mode, there would be local preference that would determine what procurement standards or policies would be complied with.

Yes, it would take the Federal Government out of dictating this if they weren't funding.

Mr. EDGAR. So you would get the Federal Government off our backs and out of our pocketbooks——

Mr. GOLDMAN. But still setting standards, performance standards would have to be met and still granting the permits.

Mr. EDGAR. But even if you had a loan program that was Federal dollars, we at the Federal level would have some responsibility on how in fact those Federal dollars would be expended.

Mr. GOLDMAN. That is correct.

Mr. EDGAR. And Davis-Bacon and some of the other prevailing provisions would still apply.

Mr. GOLDMAN. Yes, but, as I understand it, again I don't have an engineering background either, as I understand it a major reason why these projects take so long and cost so much money is the public bidding laws, the various reviews and interfaces with the delegated State agencies or regional offices of EPA reviewing and approving steps throughout the process and what some engineers might refer to as deliverables out of the grants program which aren't necessarily directly related to the treatment facility at hand, but are interim actions, or interim reports which have to be prepared, and that if you could eliminate some of those activities and save time, time is money.

Mr. MCNULTY. The gentleman's time has expired. Mr. Smith.

Mr. ROBERT SMITH. I think it is a fascinating discussion and an interesting thought that you have.

I am trying to determine in my mind how it would work. Help me, if you will.

I am assuming that you would go to a community, suggest to them, after outlining the plan, a cost per month for the improvement, and that would be the determination by the city council as to whether or not to go ahead with privatization or how would you go to a community, and on what basis would you go, outlining the cost ultimately to the consumer, so they can make a decision whether to provide for a bond issue, for their waste water treatment, or whether merely to hire a private firm to do it and then, of course, pass on the cost.

Mr. GOLDMAN. Let me explain how our firm has been involved in serving as consultants and let me cite a specific case which there is public information about, the city of Bayonne, N.J.

Through our work consulting with the State of New Jersey, Bayonne was designated formally as a pilot community to go forward with this approach. A consultant team for our firm worked with the city in identifying all of the funding alternatives that were available to them. Local funding, the chance of getting a grant, the chance of getting a loan through the infrastructure bank if that materialized or privatization.

Based on a very objective analysis, it was determined that the economics of privatization was the best scenario for the community to follow if it could see itself that a qualified private group would come and work with the community.

On the basis of the analysis, the community has since advertised requesting qualifications from private sector groups interested in designing, constructing, owning, and operating facilities to serve that community. That advertisement took place about 3, 4 weeks ago.

The community will be receiving statements of qualifications from interested groups within the next 2 weeks, and then the community will take appropriate steps to determine which of those groups that submitted qualifications it wants to receive formal proposals from.

And the community will lay out very carefully what it expects to get out of the transaction in terms of time period, quality of deliv-

ery of service and expected range of cost because they had the initial study done up front estimating the costs.

By arming themselves with consultants who knew tax benefits, and with our consulting engineers who pointed to the construction savings that would result if this was built privately and so forth, the community, before it enters into discussions, has a reasonable idea as to where the range of resultant user fees should be.

Mr. ROBERT SMITH. One thing you didn't mention that I can see is a direct benefit would be to a community that obviously couldn't pass a bond issue. This is an alternative method of financing.

Mr. GOLDMAN. That is exactly the case in Bayonne because New Jersey, you may be aware, imposes a cap on the outstanding indebtedness a community can have at any point in time.

The cost of Bayonne's facility is beyond their ability to pay for it themselves under State law.

Mr. ROBERT SMITH. Thank you.

Mr. MCNULTY. Thank you.

Mr. Packard.

Mr. PACKARD. Mr. Chairman, I too am very intrigued by this alternative concept. Those of us who come from local government, in fact any government, recognize that increased cost in public facilities is attributable generally to long delays.

In our case, our waste-water treatment plants more than doubled simply because we couldn't get through the maze of government regulations, and at the same time come up with a funding process.

That is a story I think that is heard all across America and that is why we are lagging significantly behind in our facilities and infrastructure.

I was going to ask the gentleman from Pennsylvania to yield but felt it might be best just to address it to my time.

When the question was asked about would this tend to invite cutting of corners, and avoiding government regulations, I thought perhaps that could be turned to a benefit because there is some gold plating and there are some corners that perhaps could be cut in terms of meeting all the regulatory and funding processes.

But, and also the question as to whether or not government can build better than private sector, I am not convinced government builds better. I think we all know that they build more expensive, but not better necessarily.

But I am not denegrating the process that we now go through. It is accomplishing, much belatedly in many cases, our goals. But I think an alternative is certainly worthy of looking at.

Do you feel it would require changes in existing laws or regulations to allow the tax benefits for privatization of waste-water treatment construction in order to enhance or permit that to happen?

Mr. GOLDMAN. Let me address that on two levels. One at the Federal and one at the State level. At the Federal level I think what has to be done is retain existing laws as opposed to permit the changes discussed by the Senate Finance Committee to go through. Specifically preserving the ability to use industrial development bonds for waste-water treatment and assuring that in a legitimate service contract mode of transaction that the accelerated depreciation benefits which were already there can be utilized.

At the State level from our work around the country we have seen, there are generally two or three legal matters that have to be addressed.

One is enabling communities to enter into long-term contracts with the private sector to provide the service. Many States limit the number of years for contracts. In addition, in many States the procurement laws would have to be clarified as to exactly how a community can go about, do they advertise for service delivery, what parts of the service are considered professional procurements versus commodity type procurements and so forth?

In addition, the role of the public utility commission needs to be carefully designed to determine to what extent, if at all, the State PUC should be involved in rate regulation.

What we have seen in most situations is that PUC's apparently would be willing to step aside or grant a waiver as long as they can see through a clear set of contractual conditions that the public's interests are protected against rate increases which aren't justified.

Mr. PACKARD. Have you or anyone else done any national studies or surveys that would verify or substantiate your indications of a savings and, if so, if you have done them, or if they are being done, we would appreciate it I think if the committee could have access to that information, if you would provide it.

Mr. GOLDMAN. Yes; we will be glad to provide you with three or four examples that have been written up in the press that we drew upon as well as other cases.

[The information received from Mr. Goldman follows:]

SUPPLEMENTAL INFORMATION PROVIDED BY MR. GOLDMAN

The example in Carlisle, Pa., has already been cited in response to Mr. Stangeland's question. Another example is in Loudon, Tenn., where, it is reported, a 14 mgd plant was built in 13 months at a cost of $4.6 million. Built through the grants program, the plant probably would have cost double if not triple that amount and taken 4 to 7 years to complete. Other examples of significant savings exist, although the cases that have been publicized are limited.

Mr. PACKARD. Thank you. Assuming that your estimates are correct and your evaluation is correct, that there could be a savings with privatization, and assuming that they can be built cheaper than what Government processes now permit these to be built, can they operate after the construction is completed and they are still operated as a private concern, can they operate at a profit?

Mr. GOLDMAN. I believe they can. I am aware of at least a dozen firms in this country that offer contract operations and maintenance services for waste water treatment facilities. Naturally the more facilities that a company has under contract, the greater the chance to use economies of scale.

But we have seen cases where the private sector has moved in to provide contract O&M in facilities that were out of compliance with discharge standards, gotten them into compliance, and has certainly not raised the previous cost.

So I assume they are making a satisfactory profit level within the previous cost.

Mr. PACKARD. I assume that that implies that these private companies are meeting all the requirements or regulations of the State PUC or other regulatory agencies, rate regulations?

Mr. GOLDMAN. I am sure that there may be some exceptions that I am not aware of, but to the extent of my knowledge, yes.

Mr. MCNULTY. The gentleman's time has expired.

The gentleman from Minnesota.

Mr. STANGELAND. Mr. Chairman, in the interest of time, I ask unanimous consent that all members be allowed to submit questions in writing to Mr. Goldman for his written response to the record.

Further, I ask unanimous consent that all testimony this morning be entered into the record in its entirety for those who have paraphrased.

Mr. MCNULTY. Without objection, so ordered.

Mr. EDGAR. Mr. Chairman, could I just ask very quickly?

Mr. MCNULTY. Yes; Mr. Edgar.

Mr. EDGAR. If you could provide for the record an answer to this question: If Congress decided to preserve the 1981 tax incentives for private waste water treatment facilities, could you estimate the cost to the Treasury in terms of the immediate loss of revenues of that?

Suppose we pursue your direction? What kind of estimates do you have in terms of loss to the revenues, loss to the Treasury?

Mr. GOLDMAN. The immediate loss, I think, would be minimal. Again, because it takes a year to two to build these facilities.

Perhaps in cases where an existing facility that wasn't built with Federal dollars was sold——

Mr. EDGAR. I am talking about the tax incentives.

Mr. GOLDMAN. Yes, but again it is the point that you can't draw upon the tax incentives until after the facility is built and operational.

Mr. PACKARD. Would the gentleman yield for a moment on that question because I would like to piggyback onto that question and not take the time for the answer to come today, but I assume you are requesting that a written answer come.

I would like not only to see what the cost to the Government would be as requested by the gentleman from Pennsylvania, but also tie that with the benefits that would be accrued financially to the local entities, so that there would be a comparison.

Where there really is a cost/benefit ratio there, that is plus.

Mr. GOLDMAN. Fine.

[The information received from Mr. Goldman follows:]

SUPPLEMENTAL INFORMATION PROVIDED BY MR. GOLDMAN

We analyzed the tax tradeoffs on one project we had recently worked on in terms of a privatization feasibility study. It was approximately a $50 million treatment system which might have been eligible, if funds were available, for a combination of a federal and state grant funding of approximately $30 million.

Given our assumptions, that same project, if owned and operated by a qualifying private sector group, could have possibly provided the owners with approximately $51 million of tax benefits over the project life, from deductions for interest payments, depreciation and the investment tax credit. However, it was also estimated that, before the facility was put into service, taxes on labor and the profits from design, equipment sales, and construction would have exceeded $4 million and over the course of the project, total taxes paid by the business would have exceeded $69 million. On balance, therefore, the tax scenario on the potential privatization transaction was a positive inflow to the government of $18 million. Using the same assumptions, grant funding of the facility would have cost the taxpayers $30 million

in grant funds, less $4 million inflow of taxes due to profit on creating the facility, or a net outflow of $26 millon to the taxpayers. On that basis, privatization approaches should be preferable, from a treasury perspective, to grant programs.

Mr. McNULTY. Members of the audience, with respect to witnesses, members of the committee, we have yet to hear from OTA, National Water Resources Association, folks from the Port Authorities and Water and Wastewater Equipment Manufacturers Association, and American Society of Civil Engineers, five presentations.

Given the hour, and after consultation with Mr. Stangeland, it seems most appropriate that we recess at this time and we propose to do so, barring any better suggestion, until what time? One o'clock? At which time we would expect to begin with Mr. Barnard from the Office of Technology Assessment.

We are in recess. Thank you.

[Whereupon, at 12 noon, the subcommittee was recessed, to reconvene at 1 p.m., the same day.]

AFTERNOON SESSION

Mr. McNULTY. The hearing will reconvene.

This is the Water Resources Subcommittee of Public Works Committee. We are considering amendments to the Clean Water Act. When we recessed at noontime we agreed to be back at 1 o'clock. I apologize for the delay. We are ready now to proceed with Dr. William Barnard from the Office of Technology Assessment.

Good afternoon.

Mr. BARNARD. the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF WILLIAM D. BARNARD, OFFICE OF TECHNOLOGY ASSESSMENT

Mr. Chairman, my name is William D. Barnard. I am the project director of the Office of Technology Assessment's study of Approaches to Wetlands Use, which was undertaken at the request of the Senate Committee on Environment and Public Works in October 1981. Our final report, which is scheduled for completion in January 1984, deals broadly with wetlands and addresses topics such as wetland values, trends in their use, and state and federal wetland programs. The report does not focus exclusively on Section 404 of the Clean Water Act, which regulates the discharge of dredged or fill material. However, many of our findings relate directly to the 404 program and its implementation by the U.S. Army Corps of Engineers.

INTRODUCTION

I would like to begin by discussing three major findings concerning wetlands. First, Fish and Wildlife Service (FWS) data indicate that in the 20-year period prior to the full implementation of the 404 program, approximately 11,000,000 acres of vegetated wetlands were converted to other uses. Second, many Federal policies and programs have opposing effects on wetlands. Third, States generally have neither the capability nor the desire to assume responsibility for regulating wetlands use.

I will elaborate on these findings and discuss a different approach for managing wetlands that may overcome some of the problems that now hamper our efforts to effectively manage the use of wetlands.

TRENDS IN WETLAND USE

Between the mid-1950's and the mid-1970's about 10 percent of all vegetated wetlands in the lower 48 states were converted to other uses. This corresponds to a net loss of approximately 550,000 acres of wetlands/year. About 80 percent of actual wetland losses during this period involved drainage and clearing for agricultural purposes. Although recent trends in wetland use are not well documented, decreas-

ing rates of agricultural drainage suggest that the current national rate of wetland conversion may be half as much as those rates of the 1950's and 1960's. However, agricultural conversions are continuing at relatively high rates in some regions of the country.

THE EFFECTS OF FEDERAL POLICIES ON WETLANDS

Federal programs that affect wetlands often do so in opposing ways. Federal tax deductions and tax credits for all types of general development activities (regardless of their location) provide incentives for farmers to clear and drain wetlands. These incentives can indirectly reduce conversion costs for farmers by as much as 30 to 45 percent. Other forms of Federal assistance to farmers, such as price supports and target prices for commodities, have not had a significant effect on wetland conversions in recent years.

The Corps' 404 regulatory program provides the major avenue for Federal involvement in regulating some activities that occur in wetlands. Based on data from 1980 and 1981, the 404 program, in combination with State regulatory programs, reduced conversions nationwide by about 50,000 acres of wetlands per year. This represents about half of the acreage that would have been converted if projects were completed as originally designed. In coastal areas, wetland conversions were reduced by 70 to 85 percent. However, activities such as excavation, clearing, drainage, and flooding, which were responsible for the vast majority of past conversions, are not actively regulated by the Federal Government or States.

STATE WETLAND PROGRAMS

State policies and practices for managing wetland use vary significantly from State to State. Most coastal States (including those bordering on the Great Lakes) regulate the use of their coastal wetlands (only). Most inland States do not have specific wetland programs. While most coastal wetlands are reasonably well regulated, inland wetlands, which comprise 95 percent of the Nation's wetlands, are generally not regulated by most States. Although States can assume responsibility for administering a portion of the 404 program, most States generally have neither the capability nor the desire to assume sole responsibility for regulating wetlands use without assistance from the Federal Government; some States would be reluctant even with assistance. Most States with wetland programs believe that State and Federal regulatory programs complement on another.

TAILORING EXISTING POLICIES TO WETLANDS

To make the Corps' regulatory program manageable in scope and to realistically limit its burden on developers, all activities that occur outside of somewhat arbitrary boundaries are not required to obtain individual permits. For example, isolated wetlands less than 10 acres in size or wetlands above the headwaters of rivers are generally not regulated by the Corps on an individual basis. However, the natural values associated with wetlands vary widely and are not necessarily related to size. wetland type, or geographic location. Therefore, many high-value wetlands are not well regulated. Similarly, for those activities that are regulated, projects occurring on high-value wetlands are treated about the same as similar projects on low-value wetlands. An alternative approach could be considered.

This approach would involve "tailoring" or adjusting existing acquisition, leasing, or regulatory policies to different wetlands (prior to possible wetland conversion). This would involve three major steps. First, wetlands would be inventoried as part of the FWS's ongoing wetland inventory. Next, regional committees composed of Government officials, wetland scientists, developers, and the general public would group the wetlands in their respective region into 3 to 5 broad categories based on the relative natural value of the wetlands. Fianlly, after considering the value of conversion activities, existing Federal, State, or local policies, would be tailored to the different development activities in each wetland category.

In this way, a coordinated mix of different policies could be applied to different wetlands and development activities. For example, undergraded, highvalue wetlands (e.g., coastal wetlands) could be acquired, covered by easement, or stringently regulated. Other wetlands, depending on their natural values, could be individually regulated, covered by general permits, or left unregulated. Several optional policies might also be used for some wetlands. For example, if certain kinds of development activities were prohibited by regulators, the owner might be given the option to sell the wetland or an easement to the Federal or State government. Priority for tailor-

ing would be given to those areas of the country where both wetland values and development pressure are high.

Although the tailoring concept appears viable, some wetland scientists and many environmentalists have reservations about its implementation. They believe that wetlands should be uniformly regulated regardless of their relative value. Other concerns focus on the uncertainties about the administration of the tailoring process, the potential for controversy and for the use of political influence, and the possible high costs associated with implementing such a scheme.

Although the process of categorizing wetlands could be controversial, the tailoring approach does have advantages over existing approaches. High-value wetlands could be given a higher level of protection than they now have. Regulators, developers, and the public would be aware of the status of the wetlands in their particular areas prior to any proposals to convert them to other uses. Agency funding and personnel could be more effectively focused on the high/value wetlands in different regions of the country rather than on all wetlands in general. The time required for any required permit decisions might be reduced. Finally, decisions about wetland use would be more predictable and consistent.

There are about a dozen areas in the United States where wetlands have been inventoried and broadly categorized according to their relative natural values. In one case, the Anchorage (Alaska) Wetland Plan is being used by local authorities and the Corps to control the development of wetlands. OTA recognizes the concerns of environmental groups, but believes that procedures can be developed for implementing the tailoring process effectively. However, it would be desirable to first test any proposed procedures on a pilot scale prior to making a decision about the desirability of full-scale implementation.

If Congress were to adopt a tailoring approach, it would also be necessary to gather additional policy-related information on: (1) recent trends of wetlands use; (2) the significance of conversion for the environment; and (3) the effect of different policies and programs on wetlands use. To ensure that these activities are relevant both to the mission s of the involved Federal agencies as well as to the policymaking process in general, an intergrated and widely reviewed work plan could be developed by an interagency working group. This plan should include a description of all ongoing and new research activities, agency responsibilities and coordination procedures, funding requirements, and opportunities for congressional oversight. The development of such a plan, which could be accomplished over a 1- or 2-year period, would require a congressional mandate.

Mr. McNULTY. Please proceed.

TESTIMONY OF WILLIAM D. BARNARD, OFFICE OF TECHNOLOGY ASSESSMENT

Dr. BARNARD. Good afternoon, Mr. Chairman.

Mr. McNULTY. The floor is yours.

Dr. BARNARD. Thank you. My name is William D. Barnard. I am the project director of the Office of Technology Assessment's study of Approaches to Wetlands Use, which was undertaken at the request of the Senate Committee on Environment and Public Works in October 1981. Our final report, which is scheduled for completion in January 1984, deals broadly with wetlands and addresses topics such as wetland values, trends in their use, and State and Federal wetland programs. The report does not focus exclusively on section 404 of the Clean Water Act, which regulates the discharge of dredged or fill material. However, many of our findings relate directly to the 404 program and its implementation by the U.S. Army Corps of Engineers.

I would like to begin by discussing three major findings concerning wetlands. First, Fish and Wildlife Service data indicate that in the 20-year period prior to the full implementation of the 404 program, approximately 11 million acres of vegetated wetlands were converted to other uses. Second, many Federal policies and programs have opposing effects on wetlands. Third, States generally

have neither the capability nor the desire to assume responsibility for regulating wetlands use.

I will elaborate on these findings and discuss a different approach for managing wetlands that may overcome some of the problems that now hamper our efforts to effectively manage the use of wetlands.

I would like to first discuss trends in wetlands use. Between the mid-1950's and the mid-1970's about 10 percent of all vegetated wetlands in the lower 48 States were converted to other uses. This corresponds to a net loss of approximately 550,000 acres of wetlands/year. About 80 percent of actual wetland losses during this period involved drainage and clearing for agricultural purposes. Although recent trends in wetland use are not well documented, decreasing rates of agricultural drainage suggest that the current national rate of wetland conversion may be half as much as those rates of the 1950's and 1960's. However, agricultural conversions are continuing at relatively high rates in some regions of the country.

Federal programs that affect wetlands often do so in opposing ways. Federal tax deductions and tax credits for all types of general development activities (regardless of their location) provide incentives for farmers to clear and drain wetlands. These incentives can indirectly reduce conversion costs for farmers by as much as 30 to 45 percent. Other forms of Federal assistance to farmers, such as price supports and target prices for commodities, have not had a significant effect on wetland conversions in recent years.

The corps' 404 regulatory program provides the major avenue for Federal involvement in regulating some activities that occur in wetlands. Based on data from 1980 and 1981, the 404 program, in combination with State regulatory programs, reduced conversions nationwide by about 50,000 acres of wetlands per year. This represents about half of the acreage that would have been converted if projects were completed as originally designed. In coastal areas, wetland conversions were reduced by 70 to 85 percent. However, activities such as excavation, clearing, drainage, and flooding, which were responsible for the vast majority of past conversions, are not actively regulated by the Federal Government or States.

State policies and practices for managing wetland use vary significantly from State to State. Most coastal States—including those bordering on the Great Lakes—regulate the use of their coastal wetlands—only. Most inland States do not have specific wetland programs. While most coastal wetlands are reasonably well regulated, inland wetlands, which comprise 95 percent of the Nation's wetlands, are generally not regulated by most States.

Although States can assume responsibility for administering a portion of the 404 program, most States generally have neither the capability nor the desire to assume sole responsibility for regulating wetlands use without assistance from the Federal Government; some States would be reluctant even with assistance. Most States with wetland programs believe that State and Federal regulatory programs complement one another.

Now I would like to make a few comments about one particular approach that we have explored which has the potential for deal-

ing with a lot of problems associated with the 404 program, and other programs that affect wetlands use.

To make the corps' regulatory program manageable in scope and to realistically limit its burden on developers, all activities that occur outside of somewhat arbitrary boundaries are not required to obtain individual permits. For example, isolated wetlands less than 10 acres in size or wetlands above the headwaters of rivers are generally not regulated by the corps on an individual basis.

However, the natural values associated with wetlands vary widely and are not necessarily related to size, wetland type, or geographic location. Therefore, many high value wetlands are not well regulated. Similarly, for those activities that are regulated, projects occurring on high value wetlands are treated about the same as similar projects on low value wetlands. An alternative approach could be considered.

This approach would involve tailoring or adjusting existing acquisition, leasing, or regulatory policies to different wetlands—prior to possible wetland conversion. This would involve three major steps. First, wetlands would be inventoried as part of the FWS's ongoing wetland inventory. Next, regional committees composed of Government officials, wetland scientists, developers, and the general public would group the wetlands in their respective region into three to five broad categories based on the relative natural value of the wetlands. Finally, after considering the value of conversion activities, existing Federal, State, or local policies, would be tailored to the different development activities in each wetland category.

In this way, a coordinated mix of different policies could be applied to different wetlands and development activities. For example, undegraded, high value wetlands (for example, coastal wetlands) could be acquired, covered by easements, or stringently regulated. Other wetlands, depending on their natural values, could be individually regulated, covered by general permits, or left unregulated. Several optional policies might also be used for some wetlands. For example, if certain kinds of development activities were prohibited by regulators, the owner might be given the option to sell the wetland or an easement to the Federal or State government. Priority for tailoring would be given to those areas of the country where both wetland values and development pressures are high.

Although the tailoring concept appears viable, some wetland scientists and many environmentalists have reservations about its implementation. They believe that all wetlands should be uniformly regulated regardless of their relative value. Other concerns focus on the uncertainties about the administration of the tailoring process, the potential for controversy and for the use of political influence, and the possible high costs associated with implementing such a scheme.

Although the process of categorizing wetlands could be controversial, the tailoring approach does have advantages over existing approaches. High value wetlands could be given a higher level of protection than they now have. Regulators, developers, and the public would be aware of the status of the wetlands in their particular areas prior to any proposals to convert them to other uses. Agency

funding and personnel could be more effectively focused on the high value wetlands in different regions of the country rather than on all wetlands in general. The time required for any required permit decisions might be reduced. Finally, decisions about wetland use would be more predictable and consistent.

This concludes my comments. I would be willing to answer any questions that you might have.

Mr. McNULTY. Dr. Barnard, in a society that considers wetlands and swamps a positive social good, I wonder, is there a distinction between converting wetlands and reclaiming swamps.

Dr. BARNARD. No.

Mr. McNULTY. Those scientists you mentioned on the next to last page of your testimony who think all wetlands should be treated the same I assume would take a position that any reclaiming of the swamp is, per se, not in the national interest?

Dr. BARNARD. That is right.

Mr. McNULTY. That doesn't leave any blurred lines, does it?

Dr. BARNARD. Well, I think their view is that the values that are associated with wetlands outweigh the benefits that would accrue from conversion activities in most cases.

Mr. McNULTY. Like sanctuaries for mosquitoes that carry malaria and things like that? I withdraw the question.

Dr. BARNARD. Thank you.

Mr. McNULTY. Mr. Stangeland.

Mr. STANGELAND. Thank you. We are having a little discussion on understanding exactly what we have got before us. You state that between the mid-1950's and the mid-1970's, or about a 20-year period, about 10 percent of all wetlands were converted. The net loss was approximately 550,000 acres of wetlands a year.

Dr. BARNARD. That is right.

Mr. STANGELAND. Then in 1980 and 1981 under the 404 program, I interpret the loss to be 50,000 acres without the 404 program, or if the projects had been completed as originally designed without 404 it would have been 100,000 acres?

Dr. BARNARD. That is right.

Mr. STANGELAND. So our loss has dropped now, through conversions from an average of 550,000 acres for those years up to the mid-1970's to now 100,000 acres. Am I interpreting your figures correctly, or am I interpreting them incorrectly?

Dr. BARNARD. The 100,000 acres would be for those activities that the corps regulates. There are activities that occur on wetlands that are not regulated actively by the corps. The 404 program only covers the disposal of dredged or fill material. There are other activities that result in wetland conversions which are not regulated.

Mr. STANGELAND. OK. On page 3 you indicate most States are not desirous to assume responsibility for regulating wetland use without assistance from the Federal Government. Some States would be reluctant even with the assistance. Why is this so? Or why do you believe it is so?

Dr. BARNARD. Well, many States feel that the benefits associated with developing wetlands outweigh their natural benefits. In a lot of cases the States would rather have the Federal Government involved so that they can remain out of this controversial area.

Mr. STANGELAND. Buck passing, so to speak then?

Dr. BARNARD. So to speak, yes.

Mr. STANGELAND. To what extent do you believe there exists opportunities to reduce some unnecessary delays in reaching 404 permit decisions? What suggestions do you have in this connection?

Dr. BARNARD. There has been a lot of discussion about the impact of delays on development activities. I think that there are a number of things that the corps could do to improve the administration of the program. In a lot of cases, corps district procedures could be standardized. They could improve the coordination between State agencies that are involved in the 404 program. And I think there are other things they could do to improve the program that might not necessarily reduce permitting processing time, such as improving monitoring enforcement and establishing reporting requirements for general permits.

Many people think that the permit processing time is not too lengthy, whereas a lot of the industry folks feel that it is very time consuming.

Mr. STANGELAND. What do you think about it?

Dr. BARNARD. Well, I think that obviously there is time required for permit processing in any regulatory program. Permit processing time for the 404 program has decreased over the last few years, and especially over the last couple years with the administrative changes that have been made by the Corps. So processing times have decreased. And I think that there is some processing time that would be associated with any regulatory program, regardless of whether it controls the use of wetlands or something else.

Mr. STANGELAND. Mr. Chairman, I have some other questions, but I think they are questions that might better be answered in writing for the record.

Dr. BARNARD. Fine.

Mr. STANGELAND. Dr. Barnard might be able to take a look at them and think through some of them.

Dr. BARNARD. OK. Fine.

Mr. STANGELAND. They will have to do with exemptions to be granted certain types of wetland areas and what you think of that. Also the definition of navigable waters, it has been suggested that we make changes there. So I will submit those in writing, Mr. Chairman.

[The questions submitted by Representative Stangeland and responses received from Dr. Barnard follow:]

The Honorable Arlan Stangeland
U.S. House of Representatives
Washington, D.C. 20515

Dear Congressman Stangeland:

I appreciate this opportunity to respond to your questions in conjunction with the hearings held by the Subcommittee on Water Resources on November 2, 1983. Our responses follow each of your questions, which are restated below.

QUESTION 1. On page 2 of your written statement, you point out that the 404 program has reduced wetlands conversions nationwide by about 10 percent, representing approximately half of the acreage that would have been converted if projects had been completed as originally designed. You also note that in coastal areas, wetlands conversions were reduced by 70 to 85 percent. Would you conclude from these numbers, as I think could be warranted, that our current 404 program appears to be working quite well in terms of striking a necessary balance between environmental and developmental interests?

Answer. How well the 404 program works in terms of balancing environmental and developmental interests is open to debate. Wetlands are presently converted to other uses at an approximate rate of 300,000 acres per year. About 50,000 of these are converted to other uses by activities that are regulated under the 404 program. This represents about half the acreage that would have been converted if projects were completed as originally proposed on permit applications. Because most coastal wetlands are well protected by the 404 program and State wetland programs, wetland conversions in coastal areas are reduced by 70 to 85 percent. Developers feel that Federal involvement in regulating the use of wetlands through section 404 borders on land use control and imposes unfair burdens on development activities.

About 250,000 acres per year are being converted by agricultural activities involving clearing and drainage that are generally not regulated by either the Federal government or the States. Many environmentalists feel that the absence of any regulations on these activities allows significant and continuing rates of wetland conversion.
